PREFACE

In the compilation of The Japan Year Book, 1935, care has been taken to preserve the features which characterized the preceding editions, while adding some new ones. All the chapters have been gone over thoroughly and revised so as to bring the material up to date and to insure greater balance as between the various sections. In this attempt some sections and even chapters have had to be entirely or partially re-written.

Both in selection and classification of material the original plan used in the previous editions of the Year Book has been followed as the most convenient one to present this country as it is before the reader.

Tokyo, September, 1935 K. Inahara, *Editor*

THE IMPERIAL COURT

At the heart of the Japanese nation and at the head of the Japanese State is the Emperor,[1] known to the people as the Tenshi, the Son of Heaven, or Tenno, Heavenly King. Though the ancient title Mikado persists in foreign countries, it has lost currency in Japan itself except in poetry or on very formal occasions.

The Imperial Dynasty of Japan is the oldest reigning family in the world, Japanese history dating its earthly origin from 660 B. C. The present Emperor is the 124th of the line.

H.I.M. THE EMPEROR

His Imperial Majesty HIROHITO, Emperor of Japan, 1st son of the late Emperor Taisho, was born in the Aoyama Palace, Tokyo, on April 29, 1901, and shortly afterwards was entrusted for bringing up to the family of Count Kawamura (Sumiyoshi),[2] a retired Admiral. Upon the Count's death in 1903, the Imperial Prince entered the Imperial Palace, with Marquis Kido (Takamasa) and later Mr. Kinsaku Maruo, chamberlain at the Aoyama Palace, in charge of his affairs. At the age of 7, he entered the elementary department of the Peers' School. In 1912, the year of his father's accession to the Throne, he was appointed Second Lieutenant in the Army and Sub-lieutenant, 2nd Class in the Navy and decorated with the Grand Cordon of the Chrysanthemum.

On completion of the elementary course in the Peers' School in 1914, he continued the study of various subjects in a special school instituted for the purpose under Admiral Togo. Promotion to the ranks of Lieutenant in the Army and Sublieutenant, 1st Class in the Navy came the same year; to Captain and Lieutenant in 1916, and to Major and Lieutenant-Commander in 1920. Ending his special studies in 1921, His Majesty toured Europe, the first Crown Prince to do so.

Because of the Emperor Taisho's illness, he was appointed Regent on November 25, 1921. Two years later, his ranks in the defence services were raised to those of Lieutenant-Colonel and Commander. Marriage to Princess Nagako took place on January 26, 1924. In 1925, he was promoted to the ranks of Colonel in the Army and Captain in the Navy. On the demise of the Emperor Taisho, December 25, 1926, he succeeded to the Throne, and the new era was named Showa, meaning Light and Peace. Formal installation took place in Kyoto on November 10, 1928, and the grand ceremony of making offerings to the Imperial Ancestors was held on November 14 and 15.

H.I.M. THE EMPRESS

Her Imperial Majesty NAGAKO, Empress of Japan, was born on

1 For the powers of the Emperor, see Chapter IV, and Articles I—XVII of the Constitution (Appendix).

2 The personal names of members of the Imperial Family and Peers are parenthesized.

Digitized by Google

March 6, 1903, 3rd child and 1st daughter of the late Imperial Prince[1] Kuni (Kuniyoshi), in his residence at 1, Roppongi-machi, Azabu-ku, Tokyo. She entered the elementary department of the Peers' School for Girls in April, 1909, and advanced to the higher course in March, 1915. Shortly after becoming Crown Princess-elect on January 17, 1918, she left the Peers' School for Girls and engaged in special study at home. Imperial sanction was given for marriage to the Crown Prince in June of the same year, and their betrothal took place on September 28, 1922. At that time she was decorated with the 1st Order of Merit. She was proclaimed Crown Princess on the day of the marriage, January 26, 1924, and Empress on December 25, 1926.

H.I.M. THE EMPRESS DOWAGER

Her Imperial Majesty SADAKO, the Empress Dowager, was born on June 25, 1884, 4th daughter of the late Prince Kujo (Michitaka) [Peer], a Court noble of the first rank. She entered the Peers' School for Girls in 1890 and advanced to the higher course six years later, leaving in 1899. Her marriage to Crown Prince Yoshihito, later the Emperor Taisho, took place on May 10, 1900. She was proclaimed Crown Princess on that day ; Empress on July 30, 1912, and Empress Dowager on December 25, 1926. Her Majesty now resides in the Omiya Palace, Akasaka-ku, Tokyo.

H.I.H. THE CROWN PRINCE

H. I. H. Imperial Prince TSUGU-NO-MIYA (Akihito) was born on December 23, 1933, and is Heir Apparent.

DAUGHTERS OF THE EMPEROR

H. I. H. Imperial Princess TERU (Shigeko) was born on December 6, 1925, and entered the elementary department of the Peers' School for Girls in 1932.

H. I. H. Imperial Princess TAKA (Kazuko) was born on September 30, 1929.

H. I. H. Imperial Princess YORI (Atsuko) was born on March 7, 1931.

BROTHERS OF THE EMPEROR

H. I. H. Imperial Prince CHICHIBU (Yasuhito), Major in the Infantry, was born on June 25, 1902, 2nd son of the late Emperor Taisho. The name Atsu was given to him at first. In 1909, he entered the Peers' School and on completion of the second year of the middle course in 1917 was enrolled in the Central Military Preparatory School. This course he finished in 1920, when he joined the 3rd Infantry Regiment, Azabu-ku, Tokyo, as a first private. Later in the same year, he entered the Military Academy, completing the regular course in 1922.

On attaining his majority in 1922, he took the name Chichibu and by Imperial order founded a new house. He was decorated with the Supreme Order of the Chrysanthemum in the same year and promoted to the rank of Second Lieutenant, attached to the 3rd Infantry Regiment. After becoming Lieutenant in May, 1925, he went abroad, studying at Oxford University until the illness of the Emperor Taisho compelled his return to Japan in January, 1927. While in England, he was decorated by King George V with the Grand Cross of the Royal Victorian Order.

Marriage to Miss Setsuko Matsudaira, born on September 9, 1909, 1st daughter of Mr. Tsuneo Matsu-

1 Imperial Prince (Shinno) or Prince (ō) means Prince of the Blood except when the name is followed by the word Peer in brackets, thus [Peer]. For the difference between Imperial Prince and Prince see the Imperial House Law, Chapter VII, Art. XXXI (Appendix).

Digitized by Google

daira (at present Ambassador to the Court of St. James's), took place on September 28, 1928. The Imperial Prince was promoted to the rank of captain in 1930 and to that of major in 1935. After a course in the Military Staff College and a term as Company Commander in the 3rd Infantry Regiment, he was attached to the General Staff, then removed to Hirosaki as Battalion Commander in the 31st Infantry Regiment on August 1, 1935. His residence is at Omoté-cho, Akasaka-ku, Tokyo.

H. I. H. Imperial Prince TAKAMATSU (Nobuhito), Lieutenant in the Navy, 3rd son of the late Emperor Taisho, was born on January 3, 1905. At first he was named Teru. He entered the Peers' School in 1911 and left in 1920 to enroll in the Naval College. On graduation four years later, he was granted the name of Takamatsu and founded a new house to revive that of the late Imperial Prince Arisugawa, which had become extinct.

In 1925, on appointment Sublieutenant, 2nd Class in the Navy, he was ordered to take up duties aboard the battleship Fuso. At the same time, he was decorated with the Supreme Order of the Chrysanthemum. Promotion to the rank of Sublieutenant, 1st Class came in 1927.

On February 4, 1930, he married Miss Kikuko Tokugawa, 2nd daughter of the late Prince Tokugawa (Yoshihisa) [Peer], who was born on December 26, 1911. The mother of the Princess was the 1st daughter of the late Imperial Prince Arisugawa, whose house Imperial Prince Takamatsu revived. In April of the same year, the Imperial Prince and his consort made a tour of the world, partly to return the courtesies shown by King George V of England in sending a mission to Japan to present the Order of the Garter to the Emperor. They returned to Japan in June, 1931, and took up residence in a new house at Takanawa, Shiba-ku, Tokyo. The Imperial Prince, now a Lieutenant, is a student in the Naval War College.

H. I. H. Imperial Prince SUMI (Takahito), 4th son of the late Emperor Taisho, was born on December 2, 1915. He entered the Peers' School in 1922 and left in 1932 to enter the Military Academy. A special residence is maintained for him in the park of the Aoyama Palace.

OTHER IMPERIAL PRINCES AND PRINCES

In addition to those of the Emperor's brothers, there are 11 Houses of Imperial male descendants :

KAN-IN. The present and 6th head of the House is H. I. H. Imperial Prince Kan-in (Kotohito), Field Marshal, who was born on November 10, 1865, the 16th son of the late Imperial Prince Fushimi (Kuniiyé), and adopted in 1867 by the Emperor Komei, the immediate predecessor of the Emperor Meiji. Ordered to France in 1882 for military studies, he remained there until 1891. After participation in the wars with China and Russia, his rise in the Army was rapid, and in 1912 he was appointed General and member of the High Military Council. In 1916, he was ordered to Russia for returning courtesies to the Russian Grand Duke's visit. The Imperial Prince became a Field Marshal in 1919, accompanied the Crown Prince to Europe in 1921 and headed the commission in charge of the Enthronement in 1928. In December, 1931, he was appointed Chief of the General Staff.

His consort, H. I. H. Imperial Princess Kan-in (Chiyéko), whom he married in 1891, was born on June 30, 1872, 2nd daughter of the late Prince Sanjo (Sanétomi) [Peer], a

Court noble of the first rank.

The heir is H. I. H. Prince Kan-in (Haruhito), Captain in the Cavalry, the 2nd son, who was born on August 3, 1902. He was graduated from the Odawara Middle School in 1921, appointed Lieutenant in 1927, promoted to the rank of Captain in 1932 and in the same year, following a course in the Military Staff College, given command of a company in the 16th Cavalry Regiment at Narashino. On July 14, 1926, he married Princess Ichijo (Naoko), 4th daughter of the late Prince Ichijo (Saneteru) [Peer], a Court noble of the first rank, who was born on November 7, 1908.

The House of Kan-in was founded in 1718 by Prince Naohito, a son of the Emperor Higashiyama. The residence is at Nagata-cho, Kojimachiku, Tokyo.

HIGASHI-FUSHIMI. The House is extinct except for H. I. H. Imperial Princess Higashi-Fushimi (Kanéko), consort of the late Imperial Prince Higashi-Fushimi (Yorihito), who married her on February 10, 1898 and died in 1922. She was born on August 29, 1876, 1st daughter of the late Prince Iwakura (Tomosada) [Peer]. The residence is at Tokiwamatsu-cho, Shibuya-ku, Tokyo.

FUSHIMI. The 23rd head of the House is H. I. H. Prince Fushimi (Hiroyasu), Admiral of the Fleet, who was born on October 16, 1875, 1st son of the late Imperial Prince Fushimi (Sadanaru). Ordered to Germany in 1889, he studied there for five years. He was appointed Admiral in 1922, a member of the High Military Council in 1925, Chief of the Naval General Staff in February, 1932, and Admiral of the Fleet in April of the same year.

His consort, H. I. H. Princess Fushimi (Tsuneko), was born on September 23, 1882, 9th daughter of the late Prince Tokugawa (Yoshinobu) [Peer]. They were married on January 9, 1897. The 1st son and heir, H. I. H. Prince Fushimi (Hiroyoshi), Commander in the Navy, was born on December 8, 1897, and graduated from the Naval College in 1917. He married, on December 23, 1919, Tokiko, 3rd daughter of the late Prince Ichijo (Saneteru) [Peer], who was born on June 20, 1902. Their 1st son, H. I. H. Prince Fushimi (Hiroaki), was born on January 26, 1932. Their first daughter, H. I. H. Princess Fushimi (Mitsuko), was born on July 28, 1929.

The second daughter, H. I. H. Princess Fushimi (Yoshiko) was born on February 14, 1933.

The third daughter, H. I. H. Princess Fushimi (Ayako) was born on February 11, 1934.

Also members of the House are H. I. H. Prince Fushimi (Hirohidé), 4th son of H. I. H. Prince Fushimi (Hiroyasu), who was born on October 4, 1912.

The House of Fushimi was founded by a great-grandchild of the Emperor Gofushimi. The residence is at Kioi-cho, Kojimachi-ku, Tokyo.

YAMASHINA. The 3rd head of the House, H. I. H. Prince Yamashina (Takehiko), Lieutenant-Commander in the Navy, was born on February 13, 1898, 1st son of the late Prince Yamashina (Kikumaro). He was appointed Sublieutenant, 2nd Class in the Navy in August, 1919, and on July 19, 1922, married Princess Kaya (Sakiko), who died in the great earthquake the following year. The Prince now leads a retired life in his residence at Fujimi-cho, Kojimachi-ku, Tokyo.

His step-mother, H. I. H. Princess Yamashina (Hisako), was born on February 7, 1874, 3rd daughter of the late Prince Shimazu (Tadayoshi) [Peer].

The House of Yamashina was founded in 1864 by the late Prince

Digitized by Google

Yamashina (Akira), 1st son of H. I. H. Prince Fushimi (Kuniiyé), who had earlier entered the priesthood and taken the name Kanshuji.

KAYA. The 2nd head of the House, H. I. H. Prince Kaya (Tsunenori), Lieutenant-Colonel in the Cavalry, was born on January 27, 1900, 1st son of the founder, the late Prince Kaya (Kuninori). He was appointed Second Lieutenant in the Cavalry in 1920 and is now Lieutenant-Colonel and Commander of the 10th Cavalry Regiment. On March 9, 1934, he left Tokyo, with his consort, for a tour round the world and returned to Tokyo on September 18 of the same year.

On May 3, 1921, he married Toshiko, who was born on May 16, 1903, 5th daughter of the late Prince Kujo (Michizané) [Peer], a Court noble of the first rank. They have five children: H. I. H. Prince Kaya (Kuninaga), born on April 21, 1922; H. I. H. Prince Kaya (Harunori), born on July 3, 1926; H. I. H. Prince Kaya (Akinori), born on August 17, 1929; H. I. H. Prince Kaya (Fuminori), born on July 12, 1931, and H. I. H. Princess Kaya (Michiko), born on July 29, 1923.

H. I. H. Princess Kaya (Yoshiko), consort of the late Imperial Prince Kaya (Kuninori), was born on December 7, 1865, 1st daughter of the late Marquis Daigo (Tadayori).

The House of Kaya was founded in 1892 by the late Prince Kaya (Kuninori), 2nd son of the late Imperial Prince Kuni (Asahiko). The residence is at Sanban-cho, Kojimachi-ku, Tokyo.

KUNI. H. I. H. Prince Kuni (Asaakira), Lieutenant-Commander in the Navy, 3rd of the line, was born on February 2, 1901, 1st son of the late Imperial Prince Kuni (Kuniyoshi). His consort, H. I. H. Princess Kuni (Tomoko), whom he married on January 26, 1925, was born on May 18, 1907, 3rd daughter of H. I. H. Prince Fushimi (Hiroyasu). There are four children: H. I. H. Prince Kuni (Kuniaki), born on March 25, 1929; H. I. H. Princess Kuni (Masako), born on December 8, 1926; H. I. H. Princess Kuni (Asako), born on October 23, 1927; and the third daughter, H. I. H. Princess Kuni (Michiko) was born on September 4, 1933.

H. I. H. Princess Kuni (Chikako), consort of the late Imperial Prince Kuni (Kuniyoshi), was born on October 19, 1879, 7th daughter of the late Prince Shimazu (Tadayoshi) [Peer].

H. I. H. Prince Kuni (Taka), Chief Priest of the Grand Shrines of Isé, 5th son of the late Imperial Prince Kuni (Asahiko), was born on August 17, 1875. His consort, H. I. H. Princess Kuni (Shizuko), whom he married on March 9, 1907, was born on September 25, 1884, 1st daughter of the late Viscount Minasé (Takasuké). There are three children: H. I. H. Prince Kuni (Iyéhiko), born on March 17, 1920; H. I. H. Prince Kuni (Norihiko), born on November 19, 1922, and H. I. H. Princess Kuni (Kuniko), born on May 18, 1917.

The House of Kuni was founded in 1875 by the late Imperial Prince Kuni (Asahiko), 4th son of the late Imperial Prince Fushimi (Kuniiyé). The residence is at Miyashiro-cho, Shibuya-ku, Tokyo.

NASHIMOTO. H. I. H. Prince Nashimoto (Morimasa), Field Marshal, was born on March 9, 1874, 4th son of the late Imperial Prince Kuni (Asahiko); ordered to inherit the Nashimotos, December 2, 1885; entered Central Military Preparatory School, 1886; graduated from Military Academy, May 27, 1898; Second Lieutenant, January, 1899; Captain, March 1901; sent to Europe for study, 1903; returned home

Digitized by Google

and immediately sent to the front at the Russo-Japanese War, 1904; again in Europe for study, August 1906—July, 1909; Lieutenant-General and Commander of the 16th Division, August, 1917; High Military Councillor, November, 1919; General, August, 1923; Field Marshal, August, 8, 1932.

H. H. Princess RI (Yoshiko), whom Prince Ri (Ken) married in 1931, was born on October 6, 1911, 1st daughter of Captain Yutaka Matsudaira, of the Navy. Their first son, Ri (Chu), was born on August 14, 1932, second son Ri (Ki) was born on March, 1935.

H. H. Prince RI (Ko), 5th son of the late Grand Prince Ri (Kei), father of Prince Ri (Ken), was born on March 30, 1877. His consort, H. H. Princess Kin, whom he married in 1893, was born on December 22, 1880, 1st daughter of the late Baron Kin Shi-ei.

H. H. Prince RI (Gu), 2nd son of Prince Ri (Ko), was born on November 15, 1912, and in 1917 was made successor to the late Prince Ri (Shun), who had died heirless.

H. H. Princess Ri (Sanshu), whom Prince Ri (Gu) married on May 3, 1935, was born on November 11, 1914, granddaughter of Marquis Boku-Ei.

H. H. Princess RI, consort of the

Digitized by Google

late Prince Ri (Ki), was born on July 10, 1883, 1st daughter of Ri Rin-kyu, and married the Prince in 1901.

H. H. Princess KIN, consort of the late Prince Ri (Shun), was born on July 8, 1878, 1st daughter of Kin Zai-tei.

Former Princes

In accordance with the Imperial Household Law, Princes of the Imperial Family may be created peers, either by order of the Emperor or at their own wishes, with family names to be granted by the Emperor. The following table shows those living who have renounced membership in the Imperial Family:

Name	Princely Father	Year of Change
Marquis Komatsu (Teruhisa)	Late Kitashirakawa (Yoshihisa)	1910
Marquis Yamashina (Yoshimaro)	„ Yamashina (Kikumaro)	1920
Marquis Kwacho (Hironobu)	Fushimi (Hiroyasu)	1926
Marquis Tsukuba (Fujimaro)	Late Yamashina (Kikumaro)	1928
Count Katsuragi (Shigemaro)	„ „ „	1929
Count Higashi-Fushimi (Kunihidé)	„ Kuni (Kuniyoshi)	1931

Former Princesses

The following table shows Princesses of the Imperial Family and the Royal House of Chosen who have married into the families of Peers:

Name	Princely Father	Consort	Year of Marriage
Ayako	Late Kuni (Asahiko)	Late Viscount Takenouchi (Koretada)	1892
Yeiko	„ „ „	„ Viscount Higashizono (Motoharu)	1899
Teiko	„ Fushimi (Sadanaru)	Marquis Yamanouchi (Toyokagé)	1901
Sadako	„ Kitashirakawa (Yoshihisa)	Count Arima (Yoriyasu)	1903
Mitsuko	„ „ „	Count Kanroji (Osanaga)	1904
Suzuko	„ Kuni (Asahiko)	Count Mibu (Motoyoshi)	1906
Takeko	„ Kitashirakawa (Yoshihisa)	Viscount Hoshina (Masaaki)	1911
Shigeko	Kan-in (Kotohito)	Kuroda (Nagamichi), heir of Marquis	1914
Yukiko	Late Kaya (Kuninori)	Machijiri (Kazumoto), heir of Viscount	1915
Hiroko	„ Kitashirakawa (Yoshihisa)	Count Futaara (Yoshinori)	1915
Yukiko	Kan-in (Kotohito)	Viscount Ando (Nobuaki)	1915
Yasuko	Late Yamashina (Kikumaro)	Asano (Nagataké), heir of Marquis	1920
Satoko	„ Kuni (Kuniyoshi)	Count Otani (Kocho)	1924
Nobuko	„ „ „	Sanjo-nishi (Kin-osa), heir of Viscount	1924
Atsuko	Fushimi (Hiroyasu)	Count Kiyozumi (Yukiyasu)	1926
Noriko	Nashimoto (Morimasa)	Count Hirohashi (Tadamitsu)	1926
Hanako	Kan-in (Kotohito)	Marquis Kwacho (Hironobu)	1926
Tokukei	Late Ri (Kei)	Count So (Takeyuki)	1931
Kikuko	Asaka (Yasuhiko)	Nabeshima (Naoyasu), heir of Marquis	1931
Mineko	Late Kitashirakawa (Naruhisa)	Tachibana (Tanekatsu), heir of Viscount	1933
Ayako	„ Takeda(Tsunehisa)	Sano (Tsunemitsu) heir of Count	1934
Sawako	„ Kitashirakawa (Naruhisa)	Viscount Higashizono (Motobumi)	1935

Palaces, Gardens, etc.

Imperial Palace The residence of the Emperor covers an area of about 531 acres in Kojimachi-ku, Tokyo. Originally built in 1457 by a provincial general, Dokan Ota, who named it Yédo Castle, it became the headquarters of the Tokugawa Shogunate in the 16th century and was greatly extended. With the transfer of the capital from Kyoto to Tokyo in 1869, the second year of the Meiji Restoration, it was selected as the Imperial Residence and renamed Tokyo Castle. Much of it

Digitized by Google

was destroyed in the great fire of 1873. The present palace, built between 1880 and 1888, cost ¥3,968,000. On completion, the name was changed to Kyujo, or Imperial Palace.

(1) Kyoto Palace. Situated in Kamikyo-ku, Kyoto, it was the Imperial Residence for 1,075 years, from 794 A. D., when the capital was moved from Nara to Kyoto, until 1869, when the seat of government was transferred to Tokyo. In accordance with the Accession Law, the ceremony of ascension to the Throne is always held here. The grounds cover about 229 acres.

(2) Aoyama Palace. Situated in Akasaka-ku, Tokyo, the palace was formerly the residence of the Lord of Tamba, but in 1873 the late Empress Dowager Yeisho made it her home. Within its large park is the residence of the Imperial Prince Sumi.

(3) Omiya Palace. Also within the park of the Aoyama Palace, it is the residence of the Empress Dowager, mother of the reigning Emperor.

(4) Shinjuku Imperial Garden. At Naito-Shinjuku-machi, Yotsuya-ku, Tokyo, the garden was originally the site of the residence of the Lord of the Takato Clan in Shinano, but in 1879 it came under the control of the Imperial Household Department and in 1906 was given its present name. Here are held the spring and autumn Imperial garden parties.

(5) Akasaka Detached Palace. Also on part of the former property of the Lord of Kii, in Akasaka-ku, Tokyo, it was made a detached palace in 1872 and became a temporary residence of the Imperial Family from 1873 to 1889 during the construction of the present Imperial Palace. Royal and princely visitors from abroad are guests here while in Tokyo.

(6) Hama Detached Palace. Situated in Tsukiji, Kyobashi-ku, Tokyo, its grounds were used by the Shoguns in feudal times for hawking and are now the scene of Imperial duck-hunting parties.

(7) Kasumigaseki Detached Palace. Formerly the residence of the late Imperial Prince Arisugawa, it is located behind the Foreign Office in Kojimachi-ku, Tokyo.

(8) Nijo Detached Palace. Originally Nijo Castle, in Kamikyo-ku, Kyoto, it was made a detached palace in 1884.

(9) Katsura Detached Palace. Located at Katsura, Ukyo-ku, Kyoto, it was formerly the residence of Prince Katsura [Katsura-no-miya] and became a detached palace in 1883.

(10) Shugakuin Detached Palace. Widely known for its beautiful garden, it was built by the Tokugawa Shogunate in the reign of the Emperor Gomizuno-o at what is now Shugakuin, Sakyo-ku, Kyoto, and was made a detached palace in 1883.

(11) Hakoné Detached Palace. On Lake Ashi in the Hakoné region, it was seriously damaged in the 1923 earthquake and has been left unrepaired.

(12) Muko Detached Palace. At Suma, Kobé, it became a detached palace in 1908.

(13) Hayama Imperial Villa. Because of its proximity to Tokyo, at Hayama-machi, Kanagawa prefecture, it is a favourite retreat, especially in the winter. Here the Emperor Taisho died in 1926.

(14) Taté-ishi Rest-House. It is located at Nishiura-mura, Miura-gun, Kanagawa prefecture.

(15) Numazu Imperial Villa. The palace is at Agehara-machi, Numazu, on Suruga Bay, Shizuoka prefecture.

(16) Nikko Imperial Villa. Nikko-machi, Tochigi prefecture, is the

Digitized by Google

location.

(17) Tamozawa Imperial Villa. This also is at Nikko-machi, Tochigi prefecture.

(18) Shiobara Imperial Villa. The palace is at Shiobara-machi, Tochigi prefecture, a district noted for its maples.

(19) Ikao Imperial Estate. This estate or preserve is at Ikao-machi, a mountain resort in Gumma prefecture.

(20) Nasu Imperial Villa. Mountain views are the main attraction of Nasu-mura, Nasu-gun, Tochigi prefecture, where the palace is situated.

(21) Nagara River Preserve. This preserve for ayu lies in Gujo-gun, Mugi-gun and Inaba-gun, Gifu prefecture.

(22) Yedo River Preserve. There are two parts, one in Higashi-Katsushika-gun, Chiba prefecture, and the other in Minami-Saitama-gun and Kita-Katsushika-gun, Saitama prefecture. The preserve abounds in water-hens, herons, snipes, quails, white swans, wild geese, ducks, plovers, pheasants, water-rails, etc.

(23) Jintsu River Preserve. This preserve for trout, salmon and other fish is located in Nei-gun and Kami-Niikawa-gun, Toyama prefecture.

In 1930, the Nagoya Detached Palace was donated to Nagoya city; and the Odawara Imperial Villa and Shizuoka Imperial Villa were abolished, part of the latter being granted to Shizuoka city. In 1931, the Atami Imperial Villa and Kamakura Imperial Villa were abolished and the former was sold to Atami-machi.

Miyanoshita Imperial villa was abolished, December, 1933, and given to H. I. H. Imperial Prince Takamatsu.

Imperial Household Finance

The Civil List is appropriated by the National Treasury and no approval of the Diet is necessary except when an increase in it is required. At present, it amounts to ¥4,500,000, any deficiency in it being met by an outlay from the Imperial property. The Board of Imperial Auditors is located in the Imperial Household Department and its present Director-General is Mr. Yahachi Kawai. Prince Saionji and Baron Ikki are financial advisers to the Imperial Household.

The total Imperial Household expenditure is estimated at approximately ¥20,000,000 annually and is met by the Civil List, ¥4,500,000, and by receipts from the Imperial forests, Imperial estates and other Imperial property.

The Naidaijin-fu

The Naidaijin, Grand Keeper of the Imperial Seals, who has been so called from olden times, is a dignitary of the Imperial Household with the function of keeping the Imperial and State Seals and of administering matters regarding Imperial decrees and documents of the Imperial Household. He is a State functionary of the Shinnin rank, or one appointed directly by the Emperor, and is assisted by three secretaries in the execution of his duty.

The Imperial Household Department

The Imperial Household Department is divided into the office of the Minister of the Imperial Household and ten principal subsidiary offices, namely, the Secretariat of the Minister, the Board of Chamberlains, the Board of Ceremonies, the Imperial Family and Peerage Board, the Imperial Mausolea Bureau, the Imperial Archives Bureau, the Court Physicians Bureau, the Imperial Treasury Bureau, the Maintenance and Works Bureau, and the Imperi-

Digitized by Google

al Stables Bureau, and is charged with the conduct of affairs pertaining to the Imperial Household. There are, in addition to those above mentioned, such other institutions as follows coming under the supervision of the Minister of the Imperial Household:

The Office of H. I. M. the Empress' Household,
The Office of H. I. M. the Empress Dowager's Household,
The Office of H. I. H. Prince Sumi's Household,
The Board of the Imperial Auditors,
The Imperial Forests and Estates Board,
The Imperial Poetry Bureau,
The Imperial Museums (at Tokyo and Nara),
The Peers' School,
The Peers' School for Girls,
The Temporary Board for the Compilation of the History of the Emperor Meiji.

Since 1884, it has been placed outside the pale of the administrative system, so that the Minister is in no way affected by any Cabinet change.

The present and preceding Ministers of the Imperial Household Department are:

Name	Time of appointment
Late Prince Hirobumi Ito	Dec., 1885
Late Marquis Hisamoto Hijikata	Sept., 1887
Viscount Mitsuaki Tanaka	Feb., 1898
Late Prince Tomosada Iwakura	June, 1909
Viscount Chiaki Watanabé	April, 1910
Baron Takatada Hatano	April, 1914
Late Baron Yujiro Nakamura	June, 1920
Count Nobuaki Makino	Feb., 1921
Baron Kitokuro Ikki	Mar., 1925
Kurahei Yuasa	Mar., 1933

Court Councillors

The Court Councillors are honorary officials of the Chokunin rank, or those appointed by the Emperor, and return reports or make recommendations on matters submitted to them for deliberation by the Minister of the Imperial Household, and, on special occasions, assist the conduct of the affairs of the Imperial Household Department by order of the Minister. At present, their number is limited to 25.

The Peerage

The modern system of the Peerage, with its five grades of Prince, Marquis, Count, Viscount and Baron, dates from 1884, but prior to this there was a well-established aristocracy. Up to the time of the Meiji Restoration, there were two groups, the Court Nobles, called Kugé, most of whom were descendants of younger sons of Emperors, and the Feudal Lords, called Daimyo or Tonosama, most of whom had attained their standing through military prowess. With the Restoration, these were amalgamated under the name of Kwazoku (Peerage), meaning the "Flowers of the Nation". In 1884, an Imperial edict was issued establishing the five grades of the present Peerage, and to the members of the Kwazoku were added subjects who had assisted in the work of the Restoration. In the first list there were 11 Princes, 24 Marquises, 76 Counts, 376 Viscounts and 382 Barons.

When Chosen was annexed in 1910, 67 Koreans of distinction were selected to become Peers, six Marquises, three Counts, 22 Viscounts and 45 Barons.

The families of the Peerage stood as follows on June 19, 1933:

Grade	Number of families	Minors to succeed when of age	Unsucceeded
Prince	19	—	—
Marquis	39	2	1
Count	110	5	—
Viscount	379	27	1
Baron	411	29	3
Total	958	63	5

Decorations

To recognize and reward persons who render distinguished and meritorious service to the State, orders of merit and decorations were created in 1875 and supplemented in later years. The orders of merit, of which there are nine—the Grand Order and numerical orders from 1st to 8th,—are only nominal and serve to indicate the class of decoration to which a holder is entitled. The decorations themselves are of seven kinds:

Supreme Order of the Chrysanthemum There are two kinds, the Collar of the Supreme Order of the Chrysanthemum and the Grand Cordon of the Supreme Order of the Chrysanthemum, both reserved for those given the Grand Order of Merit. The first, the highest Japanese decoration, is a gold chain or necklace from which is hung a small medallion representing a chrysanthemum, to which is fastened a large sunburst flanked with chrysanthemum flowers and leaves. The second is marked by the same medallions, but worn at the left hip at the bottom of a cordon or ribbon of red with purple edges hung from the right shoulder.

Rising Sun and Paulownia This is a single decoration, combining the devices of two lesser orders, known as the Grand Cordon of the Imperial Order of the Rising Sun with Paulownia Flowers which is awarded only to holders of the 1st Class Order of Merit. From a cordon of red with two white stripes, worn over the right shoulder and falling to the opposite hip, are suspended a small medallion showing paulownia flowers and leaves and a larger medallion, below it, of a double-rayed rising sun flanked with paulownia flowers.

Rising Sun There are six classes, from the Grand Cordon of the Rising Sun, to which holders of the 1st Class Order of Merit are eligible, to the 6th Class Order of the Rising Sun, which holders of the 6th Class Order of Merit may receive. Foreigners in the employ of the Government are often awarded this decoration, usually the 3rd, 4th, 5th or 6th class, after long and meritorious service. This decoration may, but not necessarily, carry an annuity.

Paulownia Two classes exist, sometimes referred to as the 7th and 8th classes of the Order of the Rising Sun. The Order of the Blue Paulownia is for holders of the 7th Order of Merit, and the Order of the White Paulownia for holders of the 8th Class Order of Merit.

Sacred Treasure Known as the Imperial Order of the Sacred Treasure. Of this order there are eight classes. The medallion represents the Mirror and Gem of the Imperial Regalia, and the cordon is of light blue with two orange stripes.

Precious Crown Its full name is the Imperial Order of the Precious Crown. The eight classes of this order are bestowed on women only, who were barred from receiving any other decoration until 1919,when they were also made eligible for the Order of the Sacred Treasure. The medallion shows the Precious Crown, with cherry blossoms and bamboo, and the cordon is of yellow with two scarlet stripes.

Golden Kite Purely a military order, known as the Imperial Military Order of the Golden Kite, this has seven classes. The cordon is green with two white stripes. It carries a life annuity, fixed in 1916 at ¥1,500 for the 1st Class; ¥1,000, 2nd Class; ¥700, 3rd Class; ¥500, 4th Class; ¥350, 5th Class; ¥250, 6th Class, and ¥150, 7th Class. This is granted to the family for one year following the recipient's death, or, if he has

Digitized by Google

died within five years of being decorated, until the end of that period.

Holders of any decorations who are sentenced to death, penal servitude or imprisonment for more than three years are deprived of decorations, accompanying diplomas and, if any, annuities. They may also be ordered to surrender them if guilty of acts of dishonour, depending on the circumstances.

Medals of Honour The Medal with Red Riband is conferred on persons who risk their lives in rescuing others; the Medal with Green Riband on those who distinguish themselves for filial piety, feminine virtues, devotion to the aged and loyalty to masters; the Medal with Blue Riband on those who aid public and private undertakings by important discoveries or inventions; the Medal with Dark Navy Blue Riband on those who contribute money or property for public welfare; and the Medal with Yellow Riband, divided into two classes, gold and silver, on persons who help undertakings connected with coast defence. Cups of gold or wood or monetary gifts are sometimes granted simultaneously to the recipients.

Court Rank

Court rank is specially conferred on persons who distinguish themselves in service to the State, peers and their heirs, officials and army and navy officers. There are 16 grades, from the senior grade of the first rank to the junior grade of the eighth rank, and all affairs pertaining to them are administered by the Imperial Family and Peerage Board in the Imperial Household Department in accordance with the Court Rank Act, promulgated in 1926.

There were 224,729 holders of Court rank at the end of 1933, divided as follows:

First	Senior	—	Junior	1
Second	„	28	„	66
Third	„	878	„	749
Fourth	„	1,735	„	3,457
Fifth	„	8,071	„	11,511
Sixth	„	13,507	„	18,861
Seventh	„	30,354	„	55,923
Eigth	„	77,965	„	2,033
Total		224,729		

Stick Granted to the Aged

In the 12th century, Toshinari Fujiwara, a Court noble, was granted on the celebration of his 90th birthday a stick for use in Court by the Emperor Gotoba. This honour, known as Kyuchuzuyé or Hatozuyé because the stick has a pigeon top, is today bestowed on Court dignitaries and officials and officers of high rank who have passed the age of 80 in recognition of signal service to the Court and the State, though it is marked by a monetary gift in lieu of an actual stick. Living holders follow:

Prince Saionji (Kimmochi)
Marquis Asano (Nagakoto)
Baron Kubota (Yuzuru)
Count Kiyoura (Keigo)
Baron Kuratomi (Yusaburo)
Count Tanaka (Mitsuaki)
Viscount Kaneko (Kentaro)
Viscount Soga (Sukenori)
Viscount Kurino (Shinichiro)
Viscount Ishiguro (Tadanori)
General Oseko (Naomichi)
Count Toda (Ujitaké)
Takahashi (Korekiyo)
Baron Yamamoto (Tatsuo)
Tomiya (Shotaro)

Court Artists

For the promotion and encouragement of fine arts, representative artists are chosen by a special committee in the Court and their appointment as Court artists is made by the Minister of the Imperial Household. The artists may produce objects of art for the Court or present opinions upon Imperial enquiries on questions pertaining to arts. Koun Takamura died in October, 1934 and new

Digitized by Google

members were appointed in December, 1934, and the present Court artists are as follows :

Sculptor	Chōun Yamazaki
Painters	Seiho Takeuchi
	Gyokudo Kawai
	Taikwan Yokoyama
	Yukihiko Yasuda
	Kansetsu Hashimoto
	Keigetsu Kikuchi
	Eisaku Wada
	Saburosuké Okada
	Takeji Fujishima
Architect	Iwajiro Sasaki
Metal Carver	Kamezo Shimizu
Metal Worker	Shushin Katori
Ceramist	Hazan Itaya

State Funerals

There had been no special provision for the State Funeral for honoured personages, although it had been held several times since the 16th year of Meiji, or 1883. The Government, however, issued the State Funeral Ordinance as an Imperial Order in 1926. According to the Ordinance, the State Funeral is held with distinguished rituals, its expenses being borne by the National Treasury. There are two kinds of State Funerals, i.e. the one for Imperial Personages and the other for the subjects. The former is still divided into two; the first one is called the Grand Funeral and is for the Emperor, the Great Empress Dowager, the Empress Dowager and the Empress, while the second one is called the Imperial Funeral and is for the Crown Prince, the Crown Princess, the Emperor's grandson and his consort, the Regent Imperial Prince or Emperor's daughters or children. Both the Grand and Imperial Funerals are held under special ritual according to the Provisions of the Imperial House Funeral Ordinance.

The State Funeral for the subjects is held in honour of those who contributed distinguished services to the country by the special order of the Emperor and the ritual and order of the Funeral is fixed by the Premier with the Imperial sanction.

State Funerals have been accorded to the following since the beginning of the Meiji Era :

Prince Iwakura (Tomomi) [Peer]	1883
Prince Shimazu (Hisamitsu) [Peer]	1887
Prince Sanjo (Sanetomi) [Peer]	1891
Prince Arisugawa (Taruhito)	1895
Prince Kitashirakawa (Yoshihisa)	1895
Prince Mori (Motonori) [Peer]	1896
Prince Shimazu (Tadayoshi) [Peer]	1897
Prince Komatsu (Akihiko)	1903
Prince Ito (Hirobumi) [Peer]	1909
Prince Arisugawa (Takehito)	1913
Prince Oyama (Iwao) [Peer]	1916
Grand Prince Ri (Kei)	1919
Prince Yamagata (Aritomo) [Peer]	1922
Prince Fushimi (Sadanaru)	1923
Marquis Matsukata (Masayoshi)	1924
Prince Ri (Seki)	1926
Marquis Togo (Heihachiro)	1934

Imperial Interest in Social Work

On various occasions of great importance in the Imperial Household, grants of money are made from the Privy Purse for social welfare, instances of which follow :

Year	Occasion	Purpose or Recipient	Amount in Yen
1897	Empress Dowager Yeisho's Funeral	—Charity	400,000
1912	Emperor Meiji's Funeral	—Charity	1,000,000
1914	Empress Dowager Shoken's Funeral	—Charity	600,000
1915	Emperor Taisho's Enthronement	—Charity	1,000,000
1924	Prince Regent's Wedding	—Promotion of social works	1,000,000
	,,	—Encouragement for the poor to send children to school	1,000,000
1925	Emperor Taisho's Silver Wedding	—Young Men's and Women's Ass'ns	750,000
	,,	—Cultural Bodies in the Colonies	250,000
1927	Emperor Taisho's Funeral	—Charity	1,500,000
1928	Demise of Princess Hisa, the Emperor's daughter	—Protection of the young	50,000
1929	Emperor's Enthronement	—Charity	1,500,000
1934	Birth of the Crown Prince, Akihito	—Protection of mothers and the young	750,000

Digitized by Google

Since 1879, it has been the custom of the Imperial House to make monetary contributions when there are floods, fires, railway accidents, violent winds, shipwrecks, earthquakes, famines, volcanic eruptions, mine explosions, etc. Immediately after the great earthquake and fire of 1923, a grant of ¥10,000,000 was made for relief.

A fund of ¥1,500,000 in 1911 for extension of medical treatment to the poor was used to found the Saisei-kai, the Imperial Charity Association, which continues active today. Additional money for this work was included in the grant of ¥3,000,000 in 1932 for relief of the poor, and it was extended to the Colonies by a grant of ¥300,000 to the Overseas Ministry.

With the ¥1,000,000 granted on the occasion of the wedding of the present Emperor, Viscount Kiyoura, Premier at the time, established the Keifuku-kai, Beatitude Association, for promotion of social work done by private bodies. On every Kigensetsu, the anniversary of the foundation of the country, which takes place on February 11, Imperial grants are made directly to public and private social welfare organizations. At first limited to such organizations as the Japan Red Cross Society, the Women's Patriotic Association, the Imperial Association for the Support of Soldiers, the Salvation Army, the Fukuden-kai (Charity Association) Orphanage and the Tokyo Asylum, these grants have been greatly increased since 1921 and now go even to superior private bodies in Chosen, Taiwan, Karafuto, the Kwantung Leased Territory and the South Sea Islands.

In 1932, a grant of ¥1,500,000 was made to the Association for the Promotion of Learning through the Education Minister.

Since the days of the Emperor Meiji, it has been customary for the Emperor, while travelling in the provinces to supervise the grand military and naval manoeuvres or on observation tours, to send representatives to various welfare organizations to present money or other gifts.

Also since the beginning of the Meiji Era, the Emperor, the Empress, the Empress Dowager and the Imperial Princes and Princesses have frequently visited charity hospitals, schools for the blind and dumb and other social welfare institutions. Many such organizations have Princes and Princesses of the Blood as presidents. The present Empress Dowager is particularly interested in the relief of lepers and in 1930 granted funds to all bodies engaged in this work.

Court Rituals

GRAND RITUALS. The Grand Rituals are those conducted by the Emperor personally, with Princes and Princesses of the Blood, Court dignitaries and officials and officers of high rank in attendance. Brief descriptions follow:

Genshisai, the celebration of the auspicious origin of the Imperial Throne at the beginning of the year, is performed on January 3 by the Emperor at the Three Shrines in the grounds of the Imperial Palace, the Kashikodokoro, where the Sacred Mirror is installed, the Koreiden, the shrine of the Imperial Ancestors, and the Shinden, the sanctuary of Shinto deities.

Kigensetsusai, to celebrate the ascension to the Throne of the Emperor Jimmu, is performed by the Emperor at the Three Shrines on February 11. In the evening, sacred music and dances are given in a pavilion in front of the Koreiden.

Shunki-Koreisai, for the worship of preceding Emperors and Empresses

Digitized by Google

and Princes and Princesses of Imperial lineage, takes place in the Koreiden on the day of the vernal equinox.

Shunki-Shindensai, performed on the same day in the Shinden, is to offer thanks to the Gods of Heaven and Earth for their blessings and to petition for their continuance.

Jimmu-Tennosai, which takes place in the Koreiden, marks the anniversary of the demise of the founder of the country, the Emperor Jimmu, on April 3. To his mausoleum is despatched on the same day a Court official representing the Emperor to make offerings. At fixed intervals, the Emperor personally conducts the rite at the mausoleum.

Shuki-Koreisai and Shuki-Shindensai are identical in form and purpose with the vernal equinox rituals but take place on the day of the autumn equinox.

Kannamé-no-Matsuri, the ritual of offering thanks for the harvest and new rice to the soul of the Imperial Ancestress, Amaterasu-Omikami, which takes place in the Grand Shrines of Isé on October 16 and 17, is duplicated in the Kashikodokoro at the Imperial Palace on October 17.

Niinamé-no-Matsuri, conducted between November 23 and 24, is marked by the Emperor partaking of new rice after offering it to the Imperial Ancestress, Amaterasu-Omikami, and all the Gods of Heaven and Earth. The same ritual, when performed at the Emperor's enthronement, is called Daijo-sai.

Taisho-Tennosai marks the anniversary of the demise of the Emperor Taisho, the Emperor's father, and is celebrated in the Koreiden on December 25. In the evening, sacred music and dances are performed in a pavilion in front of the shrine. A court official representing the Emperor is sent on the same day to the mausoleum of the Emperor Taisho to make offerings, a rite which the Emperor himself performs at fixed intervals.

ORDINARY RITUALS. These are Court rituals which the Emperor does not conduct personally, but which he attends with the Princes and Princesses of the Blood, Court dignitaries and officials and officers of high rank.

Saitansai, held at dawn on January 1 at the Three Shrines, is for worship of the Imperial Ancestors and the Gods, offering thanks to them for the grace of Heaven and supplicating for its continuance.

Komei-Tennosai marks the anniversary of the demise of the Emperor Komei, great-grandfather of the Emperor, and is held in the Koreiden on January 30. The rite of presenting offerings at his mausoleum is performed on the same day.

Kinensai, held on February 17 in the Three Shrines, is the ritual of praying for a bountiful harvest and for the continued prosperity and well-being of the Imperial House and the nation. A Court official representing the Emperor is dispatched on the same day to the Grand Shrines of Isé to make offerings, and offerings are also presented at various other shrines.

Ninko-Tennosai, marking the anniversary of the demise of the Emperor Ninko, great-great-grandfather of the Emperor, is performed on February 21 in the Koreiden. Offerings are made and a ritual conducted at his mausoleum on the same day.

Tenchosetsusai, held in the Three Shrines on April 29, the birthday of the Emperor, is the ritual of praying for the longevity of His Majesty.

Meiji-Tennosai is observed in the Koreiden on July 30 to mark the

Digitized by Google

anniversary of the demise of the Emperor Meiji, grandfather of the Emperor. Offerings are made and a ritual performed at his mausoleum on the same day.

Meijisetsusai is held on November 3 to praise the great achievements of the Emperor Meiji, to remember his high virtues, to invigorate and develop the spirit of the national revival in the Meiji Era and to pray for increased national prosperity.

Kashikodokoro-Mikagura, a sacred dance, is held in the Kashikodokoro in the middle of December. As no definite date is fixed, an auspicious day is named every year by Imperial order.

OTHER RITUALS. The Imperial Court also observes several rituals not specified in the Court Ritual Act:

Shusai, Tenth-day Ceremony, is held on the 1st, 11th and 21st of every month except January 1, the Emperor observes the ceremony for the Gods more elaborately than on the usual days.

Futsukasai and Mikkasai are performed on January 2 and 3, with the New Year's Day Ceremony. These are observed with specially elaborate rituals.

Joyasai, New Year's Eve Ceremony. At the end of the year the Emperor gives thanks to the Gods for their benevolence throughout the year and prays for blessings in the coming year.

Ye-ori, the rite for purification of the person of the Emperor, is held in the Phoenix Hall of the Imperial Palace on June 30 and December 31.

O-harai, held on the same days as Yo-ori, is a similar rite for the purification of all officials and officers from sins committed unconsciously.

SPECIAL CEREMONIES. Two special ceremonies at the Imperial Court are worthy of note:

Kosho-Hajimé, or the ceremony of delivering lectures in the Court at the beginning of the New Year, takes place in the presence of the Emperor and Empress, Princes and Princesses of the Blood and Court dignitaries in the Phoenix Hall. Usually three lecturers are chosen, with three others held in reserve, from the nation's most erudite scholars of Japanese classics, Chinese classics and Western learning to lecture on subjects related to their specialties.

Utakai-Hajimé, or the Imperial New Year Poetry Party, is usually held in the middle of January in the presence of the Emperor and Empress, Princes and Princesses of the Blood and high Court dignitaries. Though long in existence, it became one of the most important annual ceremonies in 1869. A few months in advance, the Imperial Household Minister announces the theme for the waka, or tanka, poems of 31 syllables, to be submitted. For the honour of having a poem read in the ceremony, anyone may compete. In addition to those by subjects, poems by the Emperor and Empress and other members of the Imperial Family are read.

CHAPTER I

GEOGRAPHY

Position and Extent

The Japanese Empire, wholly within the Asiatic half of the North Pacific, consists of Japan proper and various colonies. At the time of the Meiji Restoration, 1868, there were the four large continental islands of Honshu, or Hondo, usually known as the Mainland, Kyushu, Shikoku and Hokkaido, or Yezo, and 4,068 adjacent islands of smaller size. Russia ceded the long chain of islands called the Chishima,[1] or the Kuriles, in 1875. The Ogasawarajima, or Bonin Islands, were formally annexed in 1877, and the Ryukyu, or Loochoo Islands, in 1879, though both groups had been earlier under Japanese control. All these areas today constitute Japan proper.

The Colonies The first colony, Taiwan, or Formosa, with the adjacent islands called the Bokoto, or Pescadores, was ceded by China in 1895 following the Sino-Japanese War. The Russo-Japanese War brought Karafuto, or the southern half of the island of Saghalien, and, in Manchuria, the Kwantung Leased Territory and the South Manchuria Railway Zone. Chosen, or Korea, was annexed in 1910. The mandated Caroline, Mariana and Marshall islands, former German possessions in the South Seas, were received by Japan at the Versailles Peace Conference, 1919. With the exception of the Aleutians, the northern half of Saghalien, the Philippines, North Borneo, Hawaii and a few small scattered islands, including Guam, the Empire spreads over all the islands in the Pacific north of the equator.

The most northern part of the Empire, the island of Araito in the Chishima, touches 50° 55′ N. Lat. The southern extreme is in the mandated Caroline Islands, 1° 01′ N. Lat. To the west, the Bokoto extend to 119° 18′ E. Long., and to the east, the mandated Marshall Islands reach 172° 10′ E. Long.

Length and Width If the South Sea Islands, the Kwantung Leased Territory, the South Manchuria Railway Zone and the continental peninsula of Chosen are omitted, the Empire is a semi-circle of islands extending in latitude from 21° 45′ N. to 50° 55′ N., approximately 3,380 kilometres, and in longitude from 119° 18′ E. to 156° 30′ E., with a maximum width of about 320 kilometres.

Area

The total area of the Empire is 681,024,70 square kilometres, distributed as shown in the following table:

Divisions	Area in Sq. Kilometres
Grand Total	681,024.70
Japan proper	382,314.39
Honshu	230,301.67
Shikoku	18,772.68
Kyushu	42,078.71
Hokkaido	88,775.04
Ryukyu	2,386.29
Chosen	220,740.72
Taiwan	35,846.69
Bokoto	126.86

1 The Japanese word for island or islands —no differentiation is made for number—is shima, sometimes read jima. In some instances, the Chinese reading, to, is used, as in Bokoto. It has been thought best to leave it untranslated, for it forms an integral part of the name.

Digitized by Google

Divisions	Area in Sq. Kilometres
Karafuto	36,089.77
Kwantung Leased Territory	3,462.45
South Sea Mandated Islands	2,148.80
S. M. R. Zone	295.02

Japan proper occupies 57 per cent. of the total area, while Chosen occupies 33 per cent., and Taiwan and Karafuto 5 per cent. each.

Atmospheric Conditions

The average atmospheric pressure of 1933 was highest in Chosen, Manchuria and China, recording 762-763 mm., the highest being 763.9 mm. of Tientsin. The meteorological stations in the Main Island recorded about 761 mm. as in the previous year, and in Hokkaido, Karafuto and the South Sea Islands the pressure was lower in general, the lowest being 757 mm. at Palau. It was mostly above 760 mm. in Formosa and Loochoo.

In the same year, the mean temperature rose higher than 20° C. in Formosa, Loochoo, the Bonin Islands and the South Sea Islands, the highest being 26° 8′ at Palau. In Shikoku, Kyushu and the districts which face the Pacific Ocean, ending with the Tokyo Gulf at the northernmost, it was about 16°; in the districts west of Kyoto in the Main Island 15°; in the eastern mountainous districts 10°–13°, in the north-eastern districts 10°; in Hokkaido mostly 5°, except 8° at the southern end; and in Karafuto 3°, the lowest being 0° at Shisuka. In Chosen, it was 10°–14° in the south and 3° at the most northerly border. In Manchuria it was about 10°. The highest record was 37° 7′ at Taihoku in Formosa, 38° 3′ at Sasebo in Kyushu, and the lowest 27° 9′ below zero at Asahigawa in Hokkaido, 33° 8′ below zero at Shisuka in Karafuto.

In 1933, places where the annual quantity of precipitation was more than 3,000 mm. were Takada, Owashi, Odaigahara and Palau; more than 2,000 mm. Hachijo-jima, Fushiki, Wajima, Kanazawa, Ibuki-yama, Shimizu, Kochi, Shionomisaki, Naha, etc. In the Main Island it was 1,000-2,000 mm.; in Hokkaido 900-1,000 mm.; in Karafuto 600-900 mm.

The average velocity of the wind does not vary much in the plains, being from one metre to three metres per second; but at Ibuki-yama the Boko Islands, Unzen-daké, Hachijo-jima, Naha, and Choshi it was more than 5 metres. Hakoné-yama, Ibuki-yama, Naha, Shana, and Ishigaki-jima experienced a maximum velocity of more than 30 metres per second.

The Kansai Typhoon in 1934 A record typhoon raged throughout the south-western half of Japan on September 21, 1934, velocity of which was reported to have exceeded 60 metres per second. According to the investigations made by the Home Ministry, it affected 35 prefectures. In Osaka prefecture the dead numbered 1,624, and the wounded together with the missed numbered 5,729. Houses totally damaged numbered 9,937. The total casualties numbered 2,499 dead, 8,399 wounded and 568 missing. Houses damaged totalled 376,350, of which those wholly tumbled down were 34,576. The number of school buildings damaged was 289.

Meantime, the damages wrought on workshops in Osaka prefecture were estimated at ¥30,000,000 covering 1,200 in number. The workshops referred herewith are confined to those which employ more than five operatives. If, therefore, to the above damages are added damages inflicted upon smaller scaled workshops the total damages are undoubtedly far greater than described in the above.

Meteorological obervations in 1933 are given in the following table:

Geological Formation

The Japanese islands lie at the east end of the Eurasia Continent, spreading more than 3,800 kilometres on the Pacific. They are arranged in the form of a festoon or a breakwater for the Continent against the Pacific waves. The numerous islands may be divided into four groups or bows: the Nippon Bow, the Chishima Bow, the Ryu-

Digitized by Google

kyu Bow and the Ogasawara or Bonin Bow. The Nippon Bow is composed of the Main Island and the small islands around it. The Main Island itself draws an arc, its convex surface projecting into the Pacific and its concave surface facing the Japan Sea, because the whole Nippon Bow was pushed out to the ocean by a mountain-making process from the side of the Japan Sea. The Nippon Bow again is composed of two mountain systems, with the Fuji volcanic range as the dividing line; they are the Northern range, or the Karafuto mountain system, and the Southern range, or the Kwenlun mountain system.

It is said that recent excavations show it almost impossible to find the oldest rocks in the formation of the Japanese Islands, but it was formerly assumed that gneiss and crystalline schist, which belong to the oldest geological eras, are found in Japan.

Gneiss Distribution Gneiss is distributed mostly in the Nippon Bow and Chosen and cannot be found in the Ryukyu and the Chishima Bows. It runs through the centre of the southern half of the Nippon Bow, while in the northern half it may be found in the plateau of Abukuma. In Chosen it is spread over a wide area. Crystalline schist runs generally along the outside of the gneiss system. In the southern part of the Nippon Bow, it starts at the Akaishi range and runs through the Kii range to Shikoku, where it develops in a wide area, taking the place of gneiss; then it crosses the strait to Kyushu and sinks under the Aso volcanic chain to appear again at Nagasaki. In Taiwan it forms the eastern part of the Taiwan mountain range. In the northern half of the Nippon Bow, it appears in the Kanto range and may be found in the Yezo mountain system of Hokkaido and in Karafuto.

Palæozoic Layer The Japanese palæozoic layer is largely aqueous rock, composed mainly of slate, sandstone, silica stone, limestone, grit stone and graywacke, with a compound of such igneous stones as granite and diorite. It is widely distributed and has much to do with the geological formation of Japan. But at the Palæozoic Era the Japanese land lay deep in the waters and did not treasure up coal as did the Palæozoic layer of the Continent. The oldest stratum of the Main Island which has been proved with a fossil is the Carboniferous layer, and any decision on older layers must remain uncertain until similar proof is available. The Palæozoic layer forms the bones of the big mountain ranges developing at the circumference of the Archæan stratum of the southern part of the Nippon Bow and is distributed in the Akaishi, Kii, Shikoku and Kyushu mountain ranges. Traces are also visible in the Hida range, Hida plateau, Tamba plateau, Chugoku range and Tsukushi range. In the northern half, it runs through the Kanto, Ashio, Hachimizo, Abukuma and Kitakami ranges to the Yezo range and Karafuto. It can also be seen in Taiwan and Chosen in wide areas.

Mesozoic Stratum The Mesozoic stratum of Japan is composed of stones similar to those of the earlier stratum. Fossils are sufficiently numerous to assure the era in which it was formed. It appears in the Kii range, the southern part of Shikoku, the Kyushu range and the Taiwan range. In Chosen, it is found in the Keisho district. In the Chugoku district, the western part of the Main Island, it comes to the surface, leading to the belief that the plains of this district were formed in this era.

Neozoic Stratum The Neozoic stratum is mainly of aqueous rock and

Digitized by Google

volcanic stones. In this era, the transformation of land and sea was incessant, and volcanic activities were most vigorous, creating most of the present volcanic chains. Through the tertiary and quaternary periods, andesite and basalt were emitted in great volume. Most of the coal-fields, oil-fields and metal mines of Japan were formed in the tertiary period. In the diluvial day of the quaternary period, volcanic explosions followed one after another, and the hills by the rivers and the higher plains of the Kanto took their present form. In the alluvial, or the most recent day of the same era, the lowest and the newest stratum at rivers, lakes and the sea shore, or sand-banks and sand-hills, came into existence. According to the investigation of the Geological Research Office, the areas of rocks of different geological eras in Japan proper are as follows :

	Sq. kilometre	Per cent.
Archaean stratum	14,189	3.50
Palaeozoic „	53,149	12.74
Mesozoic „	29,844	7.15
Neozoic „	196,079	46.87
Tertiary vomitted rocks	44,157	10.58
Quaternary „ „	79,970	19.16
Total	417,388	100.00

Block Movements According to this investigation, two-thirds of the land is of the Neozoic stratum, showing that Japan must have been upheaved upon the surface of the sea in the most recent geological era, and the large volume of vomitted rocks speaks of violent volcanic activities.

In the Palæozoic Era, the islands were all hidden under shallow waters. Even the Hida and Akaishi mountain peaks, which form the ridge of the Mainland, are composed of the sediment on the sea-bottom in those days. At the end of this era, the highest mountain ranges began to expose their heads above the waters. It was a golden age for the Mollusca and fishes, the Amphibia coming to existence at the end of it. In the vegetable kingdom, Cryptogams grew in great forests which disappeared with the end of the era.

At the Jurassic period of the Mesozoic Era, China and most of Chosen appeared upon the surface of the sea, but the land of Japan was still covered with waters, except for the great mountain ranges, which began to show their complete figures. It was the age in which the cycad, the gingko and the Coniferæ grew in abundance and toward the end of which the latifoliate trees came into existence. In the animal kingdom, the reptiles made great progress, and queer gigantic animals lived everywhere in the sea, in the air and on the land.

When the Neozoic Era dawned, Japan became a stage of great block movements of earth, and it was severed from the continent, taking the form of a chain of countless islands. The present location was assumed, although the northern part was a little later than the southern half. The line which connects the islands runs from south to north because the pressure of the block movement was from west to east. As the movements gradually ceased and the dividing lines of land and sea became stationary, the present animals and vegetables began to grow, and finally primitive men appeared.

Relationship with Continent The close connection of the islands with the Continent is supported by considerable evidence. It is asserted by most scholars that they are continental islands, which are usually located near a continent, from which they were severed in the latest geological era. It is clear that the mountain ranges of Japan have a

Digitized by Google

close connection with the Kwenlun mountain system. The north range of the Chinese mountains, after sinking into the sea, appears again in the northern part of Kyushu and reaches the central part of the Main Island, running through the Chugoku district, and the eastern end of the China mountain system reappears in southern Kyushu, from where it reaches to the Akaishi Range through Shikoku Island and Kii province. It is also known that the sea between the Japanese Islands and the Continent is but 200 metres deep at the maximum from Taiwan to Chosen. That is, if the waters fell by this distance, the East China Sea, the Yellow Sea and the Gulf of Chihli would be dried up, and Kyushu, Shikoku, the Mainland, Hokkaido and Karafuto would be connected by land. In a sharp comparison, the sea to the east and south of the islands suddenly becomes as deep as 4,000 metres and even more in some places. These facts prove that the Japanese Islands were once a part of the Continent of Asia.

Japanese animals belong to those species which are included in the old northern division in the animal distribution of the world, and Japanese plants have very close relations with those on the Continent of Asia and are quite different from those of the American Continent. Finally, paleontology gives us proof in fossil teeth of the elephant. In the layers which belong to the tertiary period or the diluvial day of the quaternary period, these fossils are often found, and some are of the same kind as those excavated in the southern districts of China. We may thus conclude that the Islands of Japan were connected with the Continent of Asia in a prehistoric but comparatively new geological era.

Natural Features

The mountains of Japan are divided into two great systems, one to the north and the other to the south. The Karafuto system, framing Northern Japan, is composed of the Yezo, Kitakami, Abukuma, Kanto and Echigo ranges, arranged from north to south, roughly speaking. Southern Japan is framed by two branches of the Kwenlun system, which has its origin in China. One branch first appears in the northern part of Kyushu as the Tsukushi range and then runs to the east, forming the Chugoku range, the Tamba plateau, the Hida plateau and the Kiso range. The other branch appears in the southern part of Kyushu, forming the Kyushu range, from which it runs east, becoming the Shikoku, Kii, Suzuka and Akaishi ranges.

Japanese mountains have characteristic fine creases, cut by the rainfall, which is specially heavy in this country. The Kyushu, Shikoku and Akaishi ranges were formed by the creasing process ; such mountains as Fuji, Nasu, Chokai and Kirishima resulted from volcanic activities, and the Kongo, Kasagi, Suzuka and Mahiru mountain ranges were born in dislocative earthquakes. As for age, the mountains of the Chugoku and Abukuma ranges, with their dull curves, are the oldest ; the Shikoku range, the Japan Alps and the Ohu range, or the range in northeastern Mainland, are rugged and young, and the plains of the Kanto district and Mino-Owari provinces are very young. The combination of these mountains and plains of diverse ages is peculiar to Japan.

Volcanic chains According to the Geological Research Office, the total number of volcanoes in Japan is 192, of which 58 are active. They may

Digitized by Google

be grouped in 11 chains:

(1) The north Japan inner, or Chokai, volcanic chain, which starts at the southwestern offing of Hokkaido, or O-shima and Ko-jima, and runs through Iwaki-yama, Kampuzan, Moriyoshi-yama, Chokai-san, ending with Gatsuzan.

(2) The south Japan inner, or Hakusan, volcanic chain, extending from Hakusan along the Japan Sea to the west through Daisen, Mitsubé-yama, Aono-yama and other smaller volcanoes and then to the Goto Islands of Kyushu.

(3) The Hokkaido volcanic chain, which links such mountains as Hakodaté-yama, Komaga-daké, Tarumayédaké and some islands in the peninsular part of western Hokkaido.

(4) The north Japan central, or Nasu, volcanic chain, including Osoré-yama, Hakkoda-san, Towada Lake, Iwaté-yama, Komaga-daké, Kurigoma, Numasawa, Arao, Funagata, Zo-oh, Bantai, Azuma, Adatara, Nasu, Nantai, Shirané, Akagi, Haruna, Tsuno-otoshi and Arafuna, which are mostly active volcanoes.

(5) The Hida volcanic chain, composed of the seven volcanoes of Hera-daké, Taté-yama, Ko-tombi, Washiba-daké, Iwo-daké, Norikuradaké and On-také.

(6) The Mikasa volcanic chain, to the west of the Hida volcanic chain, beginning with Horaijisan, of Aichi prefecture, and running westward to O-hara-yama, Mikasa-yama, Miminari-yama, Futakami-san and Kabuto-yama of Hyogo prefecture.

(7) The Seto, or Inland Sea, volcanic chain, embracing the old volcanic mountains along the coasts of the Inland Sea and extending to Kyushu, including such mountains as Futako, Kokonoyé, Yufu, Onsen and Tara. The volcanoes are all dormant.

(8) The Ryukyu volcanic chain, starting with the Aso volcano, taking in Kirishima, Sakurajima and Kaimon and extending to the Ryukyu Islands, where it connects Iwojima, Kuchino-Irabé-jima, Kuchinosé, Nakano-jima, Suwanosé, Waruiwa-jima, Tori-shima and Agunishima.

(9) The amphibolite andesite volcanic chain, which connects Aonoyama, of Shimané prefecture, and Tokusa, of Yamaguchi; appears then in Kinpo-zan and Shigumadaké, near Tokuyama, and Himéjima of Suo; meets with the Inland Sea chain and runs to Yufu, Kokonoyé and a part of Aso, and extends as far as Luzon Island, sinking to the bottom of the ocean west of the Ryukyu Islands on the way and then running along the eastern coast of Taiwan.

(10) The Fuji volcanic chain, which cuts across the heart of the Main Island from the coast of the Japan Sea to that of the Pacific Ocean, and continues to the Izu, Bonin, Sulphur, Mariana and Caroline Islands, including such mountains as Myoko, Togakushi-yama, Tateshina-yama, Yatsuga-daké, Fujisan, Hakoné and Amagi on the Main Island.

(11) The Chishima volcanic chain, which comes into Hokkaido from the Chishima, runs along the Yezo mountain system, suddenly turns to the north and seems to disappear in Karafuto.

The Japanese volcanic mountains are composed of four kinds of rocks: pyroxene andesite, amphibolite andesite, bronzite andesite and basalt. Fuji, Iwaki, Chokai, Gatsu-san, Nasu, Hakkoda, Iwaté, Bantai, Akagi and Haruna are of pyroxene andesite. In southern Japan, the Kirishima volcanic range is composed of the same rock, which is, indeed, the most widely distributed in the Japanese volcanoes. Amphibolite andesite is discovered in the mountains

Digitized by Google

which belong to the inner volcanic chains — Hakusan, Dai-sen and Mitsubé-yama. It shows itself in Taté-yama, Norikura and Ontaké also, but is most evident in the Kyushu volcanoes. Bronzite andesite is limited to the district of Kinki, near Osaka, and the volcanic mountains and islands in and along the Inland Sea. Basalt is distributed in Chugoku and the northern Kyushu districts, exposing itself at the Basalt Cave, of Tajima province, Oonéshima, Hamada, Hagi, the Aburatani Gulf and Fukuyé, of the Goto Islands.

Seas and Coast-line

With the exception of the northern frontiers of Chosen and Karafuto, every part of the Empire is surrounded by water. To the east is the Pacific, washing the Chishima, Hokkaido, Honshu, Shikoku, Kyushu, the Ryukyu, Taiwan and the mandated islands north of the equator. Between the Chishima and Karafuto is the Sea of Okhotsk, and between Karafuto and the continent the Gulf of Tartary, known to the Japanese as the Mamiya Straits. The Sea of Japan lies between Honshu and the eastern shore of Chosen. To the west of Chosen is the Yellow Sea, or Hwanghai, opening into the Eastern China Sea, or Tunghai, which touches Kyushu, the Ryukyu and Taiwan. Purely Japanese is the famous Inland Sea, enclosed by Honshu, Shikoku and Kyushu.

The Depths The greatest depth yet discovered in these surrounding seas is 9,439 metres, sounded by the warship Manshu in 1926 between Honshu and Ogasawarajima, 30° 49′ N. Lat. and 142° 18′ E. Long. Previously the record was the 8,517 metres of the Tuscarora Deep, named for the American warship which made a survey in 1874, sometimes called the Kurile-Japanese Trench, which lies along the Chishima for about 644 kilometres. The other seas are shallower than the Pacific. The Sea of Okhotsk, which is estimated to have an area of 1,527,007.73 square kilometres, has a mean depth of 838 metres. The Sea of Japan, estimated to extend over 1,007,307.41 square kilometres, has a maximum depth of 3,440 metres and a mean depth of 1,350 metres. The Eastern China Sea, except near the Ryukyu and Taiwan, is less deep. With a length of about 354 kilometres and a maximum width of 77 kilometres, the Inland Sea covers 3,430.43 square kilometres and reaches its greatest depth at 124 metres.

The Currents Two ocean currents with important climatic effects are the Kuroshio, meaning black current, which sailors know as the Japan Stream, and the Oyashio, meaning main current, which foreigners often call the Kurile Stream. The first is warm and the second cold. Arising from the North Equatorial Current north of the Philippines, the Kuroshio flows along the eastern side of Taiwan and the southern islands of the Ryukyu to about 26° N. Lat., where it splits, the main part moving to the eastern coasts of Kyushu, Shikoku and Honshu and then bearing eastward past the Aleutian Islands to the North American coast, and the offshoot flowing to the west of Kyushu and into the Sea of Japan. Varying in width from 160 to 805 kilometres, depending on the position and the season of the year, it is usually from 5° to 15° C. warmer than the rest of the ocean. The Oyashio originates in the Arctic, washes the eastern shores of the Chishima, Hokkaido and Honshu, meeting the Kuroshio. From the Sea of Okhotsk, another cold current enters the Sea of Japan through the Gulf of Tartary and flows along the Chosen coast.

Tides Tides in the Japanese Em-

Digitized by Google

pire show wide variation. High on the shores of the Yellow Sea and the Eastern China Sea, they reach from 10.4 to 10.7 metres at Jinsen, or Chemulpo, Chosen, and 5.5 metres at Miiké, Omuta, on Tsukushi Bay, Kyushu, but in the Sea of Japan they average little more than 0.6 metre. Along the Sea of Okhotsk, they range from 1.2 to 1.5 metres; along the Pacific coast, from 1.8 to 2.7 metres, and in the Inland Sea, from 1.8 to 4 metres.

Coast-line The coast-line is exceptionally long, being 52,228.787 kilometres for the whole Empire. For Japan proper, it is 30,602.458 kilometres, which means a kilometre to every 12.43 square kilometres of area, and for Chosen 18,203.726 kilometres, a kilometre to every 12.12 square kilometres. The shores of the Sea of Japan are comparatively regular, but those on the Pacific are indented with a large number of gulfs, bays and inlets, many of which afford excellent anchorages. Japan proper has more than 1,400 harbours, about half of which are utilized for trading. The best harbours of Chosen are on the Yellow Sea and the Chosen Channel. Hokkaido, Karafuto and Taiwan are less fortunate in capacious shelters for ships.

Mountains

In Japan proper, there are 250 mountains with peaks higher than 2,000 metres above sea level, the highest being the celebrated Mount Fuji, which lifts its white cap sublimely 3,773 metres above the beautiful Suruga Gulf. Chosen has 51 and Formosa 130 mountains in the same category, but the latter has five peaks higher than Mount Fuji, Niitaka-yama being the highest mountain in Japan with its height of 3,950 metres. The highest mountains in Japan proper are converged in the central part of the Main Island in the prefectures of Nagano, Toyama, Yamanashi, Shizuoka and Gifu, but there are, of course, many other mountains famous geographically and historically in the other parts of the country.

Rivers

The Empire is abundantly watered by numerous rivers, usually wide where they empty into the sea, but comparatively short in course and not navigable for many miles inland except by flat-bottomed craft. During the summer rainy season and when the mountain snows melt in the spring, torrents rush down them, often overflowing and causing damage; during the rest of the year, they dwindle to narrow and shallow

Digitized by Google

streams. If of little use for transportation, they serve as reservoirs from which water is drawn for irrigation and increasingly as sources of electric power.

Total available hydro-electric power of rivers in Japan proper is estimated at 14,090,000 h.p., the power actually developed by the end of 1932 was about 3,105,930 h.p.

Lakes

The Empire contains numerous lakes, especially in Honshu and Hokkaido, remarkable for their beautiful settings rather than extent. The most interesting are those high above sea level, formed in most cases by volcanic eruptions damming the head-waters of rivers.

The major lakes, with their height above sea level and area, follow:

Honshu	Above Sea Level (metre)	Area (Sq. kilometre)	Depth (metre)

Flora

In summer the southern part of Japan experiences tropical weather, while in winter the districts north of the Ohu provinces are subject to arctic cold. But owing to ample rainfall, the growth of plants in Japan is in general very rich, yet agriculture occupies so large a proportion of area as to restrict not only the natural distribution of flora and fauna, but a scientific study of the subject as well.

The flora of Japan is by most botanists divided into four zones:

(a) Tropical forest zone, or the banian (Ficus Retusa) zone.
(b) Subtropical forest zone, or kashi (Quercus Acuta) zone.
(c) Temperate forest zone, or the beech-tree (Fagus Sieboldi) zone.
(d) Arctic forest zone, or the dwarf mountain fir (Pinus Pumila) zone.

I **The Tropical Forest Zone** The tropical forest zone, or the banian zone, covers those portions of the plain of Formosa lower than 450 m. above sea level, as well as the Loochoo, Bonin, Sulphur and the South Sea islands. The aerial roots of the Ficus Retusa are not so large as those of the banian in India, but the species grows in abundance and to a great height, sending down its aerial roots into the ground like the tentacles of an octopus. In some parts of Sulphur Island, the Loochoo Islands and Formosa it forms impenetrable forests. The cocoanut tree is rare but grows well. In Formosa the pineapple thrives naturally, while the Agave Americana grows quite tall. The cycad (Cycas Revoluta), the tree fern (Cyathea Spinulosa), the coffee plant (Coffea Arabia), the gum tree, the orange tree, the sugar-cane, the mangifera (Mangifera Indica) and the papaw-tree (Caria Papaya) grow luxuriantly.

II **The Subtropical Forest Zone** The subtropical forest zone, or the oak zone is limited to altitudes of from 450 to 1,800 m. in Formosa, and as low as sea level in the northern half of the Loochoo Islands. The plains of Kyushu, Shikoku, that part of the Main Island south of 35 degrees North Latitude, and the southern half of the Korean peninsula belong to this zone, the temperature here being from 13° to 21°C. (55° to 70°F.), and the altitude below 1,120 m. at Mount Kirishima in Kyushu; 650 m. in the northern part of the same island; 760 m. in Shikoku, 600 m. in Chugoku or west of Kobé; 500 m. in the Tokaido districts; and 460 m. at Tsukuba-yama in the Kanto district.

Plants peculiar to this zone are those which belong to such species as the camphor-tree, the oak, the camellia, and the Ternstroemia Japonica, ever-green and latifoliate. On sandy shores, where the sea wind is strong, the black pine (Pinus thunbergii) grows, with spreading, contorted branches, an indispensable element of the Japanese landscape, made familiar to the world through the paintings of Hokusai and Hiroshigé. In the southern part of this zone the camphor-tree (Cinnamomum camphora) is abundant. The hemp-palm (Trachycarpus excelsa),

Digitized by Google

the Nagi (Podocarpus nagi) the banana plant (Musa basjoo) and the cycad are planted as ornamental trees, and grow to a good size. Agricultural plants in this zone are rice, barley, soy-bean, red-bean, German millet, the field cabbage (Brassica campestris), colza, cotton (Gossypium herbaceum), indigo-plant, tea-plant, mulberry-tree, mandarin orange, as well as the sugar-cane and the potato. In this zone there is only one rice crop a year while in the first zone it is harvested twice a year.

III **The Temperate Forest Zone** The temperate forest zone, or beech-tree zone, lies north of the 2nd zone in the Main Island, the south-western part of Hokkaido, more than half of its whole area, and in the mountainous portions of Korea; it begins at 37.5 degrees north latitude at the coast and 35° in the Main Island, and ends at 43.5° in the central part of Hokkaido. The temperature of these areas is from 6° to 13° C. (42°-56° F.). In Formosa, the mountain valleys which are between 1,800 and 4,550 m. above sea level belong to this zone, and there grow the cryptomeria, the Picea jezoensis, the hemlock and the Formosan five-leaf pine (Pinus parviflora). The representative species of this zone in the Main Island is the beech, but it is almost extinct because of commercial exploitation. In Echigo province grow many species of deciduous latifoliate trees, such as the oak (Quercus glandulifera), the Quercus crispula and the horse-chestnut (Aesculus turbinata), while among these, in some places are found varieties of acerose trees such as the Japanese cypress, the Chamaecyparis obfusa, the hatchet leaved arborvitae (Thujopsis dolabrata), the fir (Abies firma), the Tsuga sieboldii, the Abies homolepis, the Korean pine (Pinus koraiensis), the Larix kaempferi, and the like. The timber line of this zone is 4,550 m. in Formosa,—Kyushu, Chugoku, Kinki or the Kyoto-Osaka districts have no mountain which rises above this line; 2,060 m. in Shikoku; 1,700-1,760 m. in Suruga and Totomi provinces; 1,500 m. in Shinano and Kai provinces; 1,400-1,060 m. in the northern districts of the Main Island; 450 m. in the southern part of Hokkaido, and down to sea level in the centre of Hokkaido.

The agricultural plants in this zone are barley, wheat, soy-bean, red-bean, German millet, the Panicum frumentoceum and the peanut. In the north rice is often subject to damage from early frost. The forests in the southern half of this zone are the most beautiful in Japan, especially, those sections dominated by trees of Kiso valley, namely, the Japanese cypress, the Thuja standishii, the Thujopsis dolabrata, and the Sciadopitys verticillata. The cryptomeria forms vast natural forests in Akita prefecture.

IV **The Arctic Forest Zone** The arctic forest zone, or the dwarf mountain fir zone, occupies the mountain elevations above 4,500 m. in Formosa, and does not exist in Kyushu, except in small patches above 900 m. on the mountains. In the central part of Japan, Fuji, Ontaké, the Nikko and many other mountains are in this zone, while in Shikoku the belt lies between 1,800 m. to 2,580 m. The Abies veitchii, the fir-tree (Abies sachaliensis), the hemlock, the Larix kaempferi, the Abies firma, the yew-tree, the Alnus firma, the Sorbaria randaiensis and the Alpine-rose (Rhododendron hyminanthes) grow in this zone, but the principal trees differ according to districts. In Formosa, the Abies sachaliensis is the principal tree, the Abies veitchii on Kiso, Fuji, the Nikko and other

Digitized by Google

high mountains located within 40 degrees north latitude in the Main Island; the Abies firma and the Larix kaempferi in the districts further north, and the Abies sachaliensis again in Aomori prefecture. In Hokkaido and Karafuto the Abies sachaliensis and the spruce (Picea ajanensis) grow plentifully, but are not found in the Main Island. In addition, in Karafuto, the larch flourishes, as also does the Juniperus chinensis along the seashore.

Marine Flora According to Dr. Okamura, the marine flora of Japan in the Pacific Ocean is divided into two by Oshima Island, to the south of which, including the Bonin Islands, is the Tropical division, while from north of Oshima to Kinkazan lies the Temperate division. The ocean district north of Kinkazan belongs to the Arctic division, although at the southern end of this division can be found, to a certain extent, Temperate-zone seaweeds. On the western side of Japan, that is, along the coast of the Japan Sea, the Tropical and Temperate seaweed zones are divided at Makurasaki or Noma Peninsula at the west end of Kyushu Island, while the arctic zone begins at the Tsugaru Straits.

Korea As may be inferred from the geographical relation existing between the continent and the peninsula on the one hand and between the latter and Japan on the other, the flora of the northern part (38°–43° N. Lat.) of the peninsula bears a great resemblance to that of the eastern Asiatic continent, while the flora of the southern part has a close connection with that of the western part of the Main Island of Japan.

Dense forests of conifers are frequently seen in the northern districts. Pinus koraiensis is a species commonly found there. The flora of the northern half has many northern elements and bears a close relation to the flora of Manchuria and Siberia.

Elements characteristic of northern China are also to be found in the flora of the western part of Korea. Endemic genera are comparatively few,—a characteristic of continental floras. Among the endemic genera, Hanabusaya Nakai and Chosenia Nakai may be mentioned as the most interesting. Both genera are monotypic, the former belonging to the family Campanulaceæ, and the latter to the family Salicaceæ.

The South Sea Islands Pemphis acidula, Scaevola frutescens and Tournefortia argentea grow on the shore. Coconut palms and screw pines grow among the littoral bushes. Allophylus timorensis and Wedelia biflora are the most common species and form a dense growth in the interior of the islands. Generally speaking, the flora of the islands is extremely poor as far as the number of species is concerned. This suggests that it is of comparatively recent origin.

Classification There are in Japan, nearly 20,000 species of flora known to botanists. The "Illustrated Book of Botany" published by a Tokyo botanical association contains 2,070 representative species classified as follows:

I Phaneregamæ		
A Angiospermæ		
(a) Dicotyledoneæ		
1 Sympetalæ	519	species
2 Archichlamydeæ	1,046	,,

Fuji, Sakura, Sumiré, Sugé, Susuki, and Kiku

According to Dr. Makino species of the phanerogamae alone number from 8,000 to 10,000 in Japan proper. Among this great number of plants, there are very many which are specially Japanese and unique in the botanical world. Several of the most prominent of these plants are selected here and a brief explanation on each of them is given below :

Fuji (Kraunhia floribunda) Fuji or wistaria is a plant peculiar to Japan, and is not found in any other country. Chinese wistaria differs from that of Japan. Strangely enough no Chinese wistaria is transplanted in Japan, while it is found in Europe and America. The Chinese wistaria is the so-called murasaki fuji, or purple wistaria. It is a mistake to put it in the same species with the Japanese fuji as some scholars have done in the past.

The Japanese wistaria is divided into two species, viz. fuji and yama fuji (Kraunhia brachybotrya), or wild wistaria. Both grow in mountains, but are often cultivated in gardens. Yama fuji grows wild in Shikoku, Kyushu, and Chugoku and their vines are sinistral. Its flower is larger in size, but the raceme is short. Some yama fuji found in nurseries have white flowers and are called shira fuji, or white wistaria. Botanists in the West consider it as of an independent species, but it is only a variety of yama fuji. The other one, fuji, grows wild all over Japan and its vines are dextral. Wistaria found in Nara Park and that in Kasukabé in Musashi province belong to this species. Its flower-clusters are very long and they sometimes measure as much as several feet.

Sakura Sakura, or cherry-blossom, is celebrated in Japan from olden times. Yama-zakura (zakura is the euphonical form of sakura in the compound), (Prunus serrulata var. spontanea), or wild cherry blossom, is the most important of all species of cherry blossoms. The famous poem of Norinaga Moto-ori,

Shikishima no
Yamato gokoro-wo hito towa ba
Asahi ni niwo yamazakura bana.
(Isles of blest Japan!
Should your Yamato Spirit
Strangers seek to scan,
Say—the cherry wild and fair!
Lightened up in morn's sun-lit air!)

refers to this yamazakura. This species grows in the districts stretching from Kyushu in the south to Kinki (near Kyoto) in the Main Island. Many places which are noted for this sakura are found in the belt lying between these two districts. The most famous of them is Yoshino Yama near Nara.

Recently some scientists made an

Digitized by Google

attempt to call it shiro yamazakura, or white wild cherry.

The reason that these people consider it more convenient to call it shiro yamazakura is that they gave the name of beni yamazakura, or red wild cherry to the other species. But to this red wild cherry the name of oyamazakura (Prunus serrulata var sachalinensis) has already been given.

Oyamazakura grows in the mountain districts of the Central provinces, Tohoku, Hokkaido and Karafuto and was not probably known to our ancestors in the western half of the Main Island who loved yamazakura.

The ordinary yamazakura grow in mountains and are planted in public and private gardens or along public roads.

The so-called satozakura, or village cherry does not grow in the mountains. They must have varied from the original yamazakura.

The sakura which is called Yoshino-zakura by florists and is widespread to-day all over the country with Tokyo as the centre, is known as somei-yoshino (Prunus yedoensis), in the botanical world. It appeared in Tokyo at the beginning of the Meiji Era. But where florists at Somei got its seedlings is not known. It was about the fifth year of Meiji that they were planted in Ueno Park. The reason that this blossom is called somei-yoshino by scientists is to avoid confusion with the sakura at Yoshino mentioned above. Somei-yoshino appears not to have existed in Yedo, the present Tokyo, during the time of the Tokugawa Shogunate.

This somei-yoshino, strange as it is, existed exclusively in Tokyo, and was rarely transplanted out of the city for long. It is found everywhere in Japan to-day, but it is only since 1902 that it began to spread out from Tokyo.

It has become known that this species of sakura is growing wild in Saishu Island, Korea. However, since it cannot be surmised that its seedlings were brought to Tokyo from this island, the origin of this sakura in Japan proper can still be said to be unknown. Some botanists in the West consider that this somei-yoshino is a species which is akin to higan-zakura (Prunus subhirtella), which blossoms at the time of the equinoctial week, and oshima-zakura (Prunus serrulata var albida, a kind of yamazakura which grows on Oshima Island in Izu province). But it is not confirmed yet.

Higan-zakura belongs to a different species. It is divided into two classes in botany. The trunk of one class is large, while that of the other is small. The former is found in Ueno Park, Tokyo, and the latter is rarely seen in the Kanto district.

The small higanzakura, however, is found everywhere in Kansai (western) district and blossoms much more prettier than the other kind. It is also found in Shinano province, although it grows into a comparatively large-sized tree.

The large higan-zakura is not found in such great numbers as the other one. Jindai-zakura of Shinano, and Ishiwari-zakura of Iwaté belong to this species. Shidare-zakura (the willowy sakura) also comes from this species and is called azuma-higan.

Sumiré (Viola mandsurica) The species of sumiré or violets is called viola in botany and violet is a popular English name, while sumiré is the popular Japanese name for it. This name is said to have originated in the carpenter's "sumi-tsubo or sumiiré", or Indian ink-stand made of wood to which the flower resembles in shape. This "sumiiré" changed into "sumiré," so the story goes.

Digitized by Google

In botany, sumiré is restricted to a species with flowers of deep purple-colour. Varieties are ko-sumiré, tsubo-sumiré (Viola verecunda), tachitsubo-sumiré (Viola grypoceras), akané-sumiré (Viola phalacrocarpa), ezo-sumiré, ki-sumiré, tsukushi-sumiré (Viola diffusa), etc.

Japan is a kingdom of violets where there are found more than hundred species. In the number of species no country in the world compares with Japan. While the United States of America is so vast in area, kinds of violets which are found there number only about fifty.

Sugé (Carex) of sugé, carex or sedges, the most prominent is kasa sugé (Carex disparata), or umbrella sedges, and mino sugé, or raincoat sedges. More than 800 species of carex are found in Japan.

Susuki (Miscanthus sinensis) Susuki, or pampass grass is called in some places kaya. The tassel-like bunches of its flowers is called "obana," which is included among Nanakusa, or seven herbs. (See Chap. XXXVII, Calendar of Annual Events).

The graceful form of susuki with obana on them touches the Oriental heart and has been the subject of many celebrated poems. There are many species such as masuhono-susuki, masuuno-susuki, sugurono-susuki, etc.

Susuki grows abundantly in mountains and on the fields, and the tuffs of obana nod before the autumnal wind.

Kiku (Chrysanthemum sinense) Kiku or chrysanthemum is a celebrated flower in Japan. It is worthy of being the national flower and is used as the Imperial crest.

The Chinese chrysanthemum, from which the Japanese kiku is derived, had been cultivated in China before it was transplanted to Japan.

The scientific name of this flower is Chrysanthemum sinense. The word chrysanthemum is that given to the genus of this family in Europe apart from kiku, before this flower was known in that continent. Sinense is the name of the species and means China. Therefore Chrysanthemum sinense means the Chinese chrysanthemum. When it is called Chrysanthemum japonicum, it becomes the scientific name of Japanese chrysanthemum or ryuno-giku. Chrysanthemum arcticum means arctic chrysanthemum and is the scientific name for kohama-giku.

The origin of chrysanthemum is the wild chrysanthemum grown in China. The Chinese began to cultivate it. The chrysanthemums which were cultivated by Chinese horticulturists were brought into Japan and grew into countless varieties of chrysanthemum of to-day. In 1884 it was found by Dr. T. Makino, that the original Chrysanthemum sinense, which were thought to have existed only in the old China, grows in Loochoo Islands, Kyushu, Shikoku and the part of the Main Island west of Kobe.

He gave it the name of nojigiku (Chrysanthemum sinense var japonense).

The stems, leaves, flowers, colour and flagrance which nojigiku possesses are the same as those which the original species of cultivated chrysanthemum in China has.

Fauna

Japan possesses an exceedingly rich and varied fauna closely related to the adjacent continent and classified into two principal groups, the Palæarctic, and the Oriental. Of these the Palæarctic elements are chiefly found in the northern territories, such as the Kuriles, Saghalien, Hokkaido, Japan proper, and Korea, while the Oriental ones range over the islands of Formosa and Loochoo.

Digitized by Google

Because birds and animals can move their habitat it is more difficult to classify them but, in general, Formosa, the Loochoo, and the Bonin Islands belong to the so-called Oriental zone, according to the world biological division, and include such tropical animals as the buffalo (Bubalus bubalis), the Formosan leopard (Felis dardi brachyurus), the Manis pentadactyla and the big snakes. Tropical insects are found in abundance. In the Loochoos live such rare species as the Trimeresurus flavoviridis, a poisonous snake, and the leaf-butterfly (Kallima inachus formosana). South of Bird Island, Izu, albatross frequent the blue waters; while in the Bonin Islands and southward the Japanese white-eye congregate. On Sulpur Island tropical birds with red tails can often be seen. From Kyushu northward according to the biological theory, extends the Palaearctic Zone with its fauna of the Temperate zone, specially domestic animals; while the wild animals found are the antelope (Capricornis crispus), deer (Sika nippon), wild boar (Sus leucomystax), bear (Ursus torquatus japonicus), fox (Vulpes vulpes japonicus), badger (Nycterentes procyonoides), the Meles anakuma, the Martes melampus, and the squirrel (Sciurus Lis). Different species of monkeys are also found. Among birds there are the green pheasant (Phasianus versicolor versicolor), copper pheasant (Graphophasianus soemmerringii scintillans), snowy heron (Egretta garzetta garzetta), hawk (Astus gentilis schvedowi, etc.); the crow (Corvus coronoides japonensis) is the most common. In the Northeastern districts of the Main Island, and in the high mountains, are found all the birds of the north, and also such arctic rovers as the hare (Lepus brachyurus brachyurus) and the ptarmigan (Lagopus mutus japonicus) both of which become white in winter. In Korea, the hedgehog (Erinaceus Koreanus), tiger (Felis tigris coreensis), Korean pheasant (Phasianus colchicus Karpowi), crane (Megalornis japonensis) and the like are seen.

As there is a wide difference between the kinds of animals in the Main Island and Korea, so also is there quite a difference between those of the Main Island and Hokkaido. In Hokkaido the monkey is no longer seen; the Hokkaido bear (Ursus arctos yesoensis) takes the place of the bear (Ursus torquatus japonicus); while the species of deer, rat. squirrel and ptarmigan are unlike those of the Main Island.

Karafuto again differs from Hokkaido in its species of animals. The rat, squirrel and the Ursus arctos yesoensis are the same, but there are also such species as musk-deer (Moschus moschiferus parvipes) and wild cat (Lynx lynx borealis), while in winter the tiger comes across the frozen sea from the nearby continent.

Coming to the urodele, there are various species of it, the majority of them being considered as peculiar and finding their homes in the southern district. Such species are represented by Hynobius nebulosus, H. stejnegeri, H. vandenburgi, etc. One of the most noteworthy is the giant salamander (Megalobatrachus japonicus), which inhabits the cool mountain streams of provinces in Honshu, south of Mino, and also in Kyushu. Although not common, it is not very rare. It is known to occur also in China, and may be said to represent a good example which marks off the East Asian sub-region from the others. As the representative of the northern district may be recorded H. peropus, which is found at high

Digitized by Google

altitudes. Extensively distributed in Japan proper are Diemictylus pyrrhogaster and Onychodactylus japonicus, the former being the commonest of all.

The freshwater fishes are known from an immense number of species, many of which appear to be rather limited in distribution. Some are confined to particular river valleys, others inhabit the lakes of a limited district only, while some are restricted to a comparatively narrow area. Generally speaking, the southern district presents us with the following species: Acheilognathus limbatus, Sarcocheilichthys variegatus, Opsariichthys uncirostris, Zacco temminckii, Brittosus kawamebari, Sicyopterus japonicus, Rhinogobius hadropterus, etc. Ranging over the northern area are found such forms as Oncorhynchus, Pseudoperilampus typus, Chloea senbae, etc. Widely spread over Japan proper occurs Plecoglossus altivelis. The river Nagara, in the province of Mino, is famous for its fishing with the cormorant.

Marine Fauna

On the Pacific side Japan has two principal streams of different temperatures. The warm current is known as the Japan stream, or Kuroshiwo, which is peculiar for its high salinity. This stream has its origin in the north Pacific current from the east, and passes into the East China Sea, moving northwards by way of Luzon and Formosa.

The cold current is the well-known Kamchatka stream, or Oya-shiwo, which rises from the Behring Sea, and passes down south along the eastern coast of the Kurile group and Hokkaido, extending farther southwards off Kinkwazan, or beyond, where it meets the aforesaid Kuroshiwo.

Receiving a paramount influence of the currents just sketched out, Japanese waters command a very rich and varied marine fauna, there being found two types of animal life, the northern and the southern. Neglecting here some southern and northern elements, which have their limits north in the Behring Sea and south off the Loochoo group, respectively, the following three faunal areas may be more or less clearly recognized, though contiguous zones blend one into the other:

(1) Northern zone, extending from the shore of the Kurile group to that of the northern part of Honshu which lies to the north of Kinkwazan.

(2) Middle zone, extending from off Kinkwazan to near the Shiwo-no-misaki, on the Pacific side, and representing the zone of mingling of the arctic or subarctic and tropical or subtropical forms. The Japan Sea may be dealt with as corresponding as a whole to this zone.

(3) Southern zone, comprising the shores of the parts of Japan proper lying to the south of the Shiwo-no-misaki, the Loochoo group, the Bonin group, and Formosa.

Northern Zone This district is frankly subarctic, containing animals characteristic of the Behring Sea on the one hand, and of the Okhotsk Sea on the other. Amongst the carnivorous mammals the sea otter (Enhydra lutris) is circumpolar in range, being confined to the north of Hokkaido, while the Steller sea lion (Eumetopias jubata) and several seals (Phoca vitulina, Ph. fasciata, etc.) frequent the more southern waters, some of them occasionally appearing in the seas off Hokkaido and Amurland. The northern fur seal (Callorhynus ursinus) which is of economic importance particularly abounds in Kaihyo-to (Seal Is.), a

Digitized by Google

small island near Saghalien and also on some islands of the Kuriles.

Turning to cetacea, there are three whalebone whales, such as Balaena glacialis, B. mysticutus, and Rhachianectes glaucus.

Around the Kuriles, Hokkaido, and Saghalien are found in immense quantities many fishes like the cod, salmon, and herring, which are of the same greatest economic importance as in Norway, Scotland, Newfoundland, and other countries.

Comparatively shallower in the waters are found some ascidians, like Halocynthia roretzi, Chelyosoma siboja, Molgula crystallina, M. redikorzevi, etc. The first two are largely eaten in this country. Much less developed here than in the tropics are a number of echinoderms.

Ranging from the Behring Sea to the Japan Sea occurs Paralithodes camtschatica, which attains a large size and is one of great economic importance. Its famous fishing grounds are the coasts of Kunashir and Saghalien. With this is associated the most edible crab, Chionecetes opilio.

A large number of molluscs are known from this district, of which the most valuable species are Ostrea gigas, Mactra sachalinensis, Pecten yessoensis, Ommastrephes sloani pacificus, etc.

Amongst medusae, such forms as Haliclystus spp., Aurelia limbata, Cyanea spp., Chrysaora spp., Staurophora discoidea, and Sarsia spp. frequent the northern waters.

Middle Zone In this district the arctic or subarctic overlaps the tropical or subtropical fauna, there being distinguished a great variety of animals. Most of the types characteristically Japanese belong here, abounding in rock pools and about the rocky islands. Setting aside some mammals, northern and southern, some whalebone whales may be recorded here, which are of great economic importance. The blue whale (Balaenoptera sibbaldii) which is of wide distribution and of migratory habits, appears off Kinkwazan and Hokkaido in summer, and about Shikoku and Kyushu in winter. Swimming in schools in the seas around Japan proper and Hokkaido is found the common finwhale (Bal. physalus) which appears in the north in summer, and in the south in winter. The Sei whale (Bal. borealis) has a range almost similar to the preceding, extending from the southern Kuriles in the north to as far south as the Goto group. Their famous hunting grounds are off the southern Kuriles, Nemuro in Hokkaido, Kinkwazan, the Shiwo-no-misaki, the Goto group, and Korea.

Here intruded from the southern seas are found a few species of reptiles, like Disteria cyanocincta, Hydrus platulus, Caretta olivacea, and Eretmochelys squamosa which sometimes extend north up to Hokkaido.

The chief species of fishes, the occurrence of which marks this zone off from the others, may be said to be Cynias manazo, Hyporhamphus sajori, Apogon semilineatus, Halichoeres poecilopterus, etc. Some valuable fishes, as the Japanese porgy, bonitos and tunnies are caught here in immense quantities. Of scombroid fishes, Scomber japonicus and Thunnus orientalis are found on both sides, the Pacific and the Japan Sea, extending from Saghalien and Hokkaido in the north to the East China Sea in the south. Besides, this district abounds in sardine (Sardinea melanosticta), which is replaced in the north by the herring and in the south by Etrumeus micropus. Engraulis japonicus also occurs in much abundance, having a range somewhat wider than the sardine. Here it may be noticed that, assuming the Boso peninsula near Tokyo

Digitized by Google

to be a boundary, the species of the northern area gradually drop off, and the species of the southern area become more and more conspicuous. The reverse is true of the southern elements.

Amongst ascidians there are some species like Halocynthia karasboya, Microcosmus hartmeyeri, Styela kroboja, etc.

Echinoderms are plentiful, being comprised of a number of interesting species of Ophiostiba hidekii, Asteroschema japonicum, brittle-stars, sea-urchins; and sea-cucumbers.

Amongst crustaceans, one of the most notable is a giant crab, Macrocheira kaempferi, which appears to be confined to this zone, on the Pacific side. Neptunus trituberculatus is also endemic and ranges all around Japan proper. Having a range nearly similar to the giant crab is an edible spiny lobster, Palinurus japonicus. Besides, there is a good catch of penaeid prawns which are decidedly stragglers from the southern zone.

In the Japan Sea the water is by no means simple or isolated, but compound and connected with those of other seas. Of fishes the bonitos and Euthynnus are scarcely found in the Sea. Some crabs, like Chionecetes opilio, etc., are of great commercial value and huge quantities are caught. Besides, some shrimps and prawns, belonging to the genera Pandalus and Crangon, are also found in much abundance. Amongst the cephalopods, one of the most notable is an oegopsid, Watasenia scintillans, which emits luminescence. It appears abundantly in Toyama Bay, about May. Ommastrephes sloani pacificus is thickly and extensively distributed in the Sea, its thickest distribution roughly coinciding with the extension of the Tsushima stream.

Southern Zone The fauna about Kyushu and Shikoku is less characteristically Japanese, having much in common with the neighbouring shores of the islands of Bonin, Loochoo, and Formosa, where there are forms which are almost or quite identical with those met with about the South Sea islands of Java, Celebes, Borneo, etc.

Exclusive of the hair seal (Zalophus lobatus), occasionally appearing in this zone, there can be seen a few species of whalebone whales and toothed whales.

Extensively spread over this zone are some species of reptiles, such as Laticauda laticaudata, L. colubrina, Emydocephalus ijimae, Disteira melanocephala, etc., most of them being found not to range over to the middle zone.

Of fishes there is a number of forms which are of great economic importance. Of scombroid fishes, such forms as Rastrelliger chrysozonus, Grammatorcynus bilineatus, and Gymnosarda nuda which inhabit the tropical seas have their range to Loochoo; Acanthocybium solandri and Euthynnus yaito are spread, on the Pacific side, into the middle zone; and Katsuwonus pelamis is of very wide distribution, ranging from Formosa to Hokkaido, on the Pacific side, and to middle Honshu, on the Japan Sea side, though very few in number. Cybium chinense and Sarda orientalis are rather abundant about Kyushu, but they are found in northern Honshu, both off the Pacific and the Japan Sea coasts. Of other important fishes, Pagrosomus major, Evynnis cardinalis and Taius tumifrons are distributed from Formosa to middle Honshu. Besides, some forms like Embolichthys mitsukurii, Halichoeres opercularis, Chaetodon setifer, Ch. vagabundus, and others are found to extend to, or about southern Kyushu; Kuhlia marginata

Digitized by Google

ranges from the southern seas to Idzu, and Safole toeniura to Misaki.

As they proceed southwards, ascidians seek a lower level of the sea for their habitat. Echinoderms are very much in evidence, presenting a number of species which inhabit the southern tropical seas. Some crabs like Scylla serrata, Neptunus pelagicus and Trapezia extend their range northwards to about Loochoo and Kyushu.

Ranging from off the Goto group to the Kumano Sea is a famous coral-bed, where we have such forms as Corallium japonicum, C. elatius, C. konojoi, and C. inutile. The first two corals are also found forming a bed in the waters near the Bonin group, as well as north to Formosa.

The sponges are very rich and varied. The sponge of some commercial value is represented by Euspongia irregularis, which abounds in the southern seas.

Classification Of more than 20,000 species of animals in Japan, 3,725 representative species are contained in the "Illustrated Book of Japanese Animals," by Mr. S. Uchida and others. In addition there are illustrations of 113 species which have been imported into Japan for various purposes. They are classified as follows:

I Vertebrata		
A Mammalia	91	species
B Aves	280	,,
C Reptilia	83	,,
D Amphibia	34	,,
E Pisces	448	,,

Earthquakes

Italy and Japan are the two countries in the world which are famed for earthquakes. In the frequency

Digitized by Google

of earthquakes in recent years Japan beats Italy. In 1923, when the Great Kanto Earthquake occurred, there were 2,786 sensible earthquakes and 3,915 insensible ones. The number of sensible earthquakes in the five years, 1927-1931, was 12,476 in the whole Empire. About 45% of them occurred in the Kanto district, Kyoto and Osaka districts coming next with 22%. But such earthquakes as were accompanied with casualties were very few, numbering only three during the five-year period. The seismic history of the country since 1596 records 20 big earthquakes in which the loss of lives amounted to over 1,000 each.

GREAT EARTHQUAKES IN JAPAN IN THE PAST THREE CENTURIES

Date	A.D.	Japanese year	Districts	Number of persons killed
Sept. 3	1596	(Keicho 1)	Oita (Kyushu)	708
Sept. 4	1596	(Keicho 1)	Kobé, Osaka district	1,173
Jan. 31	1605	(Keicho 9)	Pacific coasts from Kyushu to Tokyo Bay	8,800
Sept. 27	1611	(Keicho 16)	Aizu (North-east district)	3,700
Dec. 2	1611	(Keicho 16)	North-east and Hokkaido coasts	4,783
June 16	1662	(Kanbun 2)	Central district	800
Feb. 2	1666	(Kanbun 6)	Takata (Echigo province)	1,500
Dec. 31	1703	(Genroku 16)	Tokyo and Tokaido	5,233
Oct. 28	1707	(Kanyei 4)	Pacific coasts of Central district	4,900
May 20	1751	(Horeki 1)	Takata (Echigo province)	2,000
March 8	1766	(Meiwa 3)	Tsugaru straits	1,335
May 21	1792	(Kansei 4)	Unzen Mt. (Kyushu)	15,200
Dec. 18	1828	(Bunsei 11)	Echigo province	1,443
May 8	1847	(Koka 4)	Shinano and Echigo provinces	12,000
July 9	1854	(Ansei 1)	Yamato to Tokaido	1,057
Dec. 23	1854	(Ansei 1)	Pacific coasts	600
Dec. 24	1854	(Ansei 1)	Kyushu, Shikoku, Isé	3,000
Nov. 11	1855	(Ansei 2)	Tokyo and vicinity	7,000
Nov. 6	1872	(Meiji 5)	Hamada (Iwami province)	600
Oct. 28	1891	(Meiji 24)	Mino and Owari provinces	7,275
Oct. 22	1894	(Meiji 27)	Uzen and Ugo provinces	720
June 15	1896	(Meiji 29)	Miyagi, Iwaté and Aomori prefectures	27,122
Sept. 1	1923	(Taisho 12)	Kanto district	44,279
May 23	1925	(Taisho 14)	Tajima province	304
March 7	1927	(Showa 2)	Tango province	3,017
Nov. 26	1930	(Showa 5)	Izu, Suruga and Sagami provinces	248
March 3	1933	(Showa 8)	Miyagi, Iwaté and Aomori prefectures	2,935

The Kanto Earthquake and Fire which occurred on September 1, 1923, was the severest of all the recorded earthquakes in the country in the number of casualties and amount of damages.

The quake started at 11 : 58′ 31″ A.M. on that day, the epicentre being at the bottom of the sea 28 kilometres below the sea level near the mouth of the Sagami river, 139° 17′ E. Long., 35° 22′ N. Lat. It was a seismic activity caused by a block movement of the earth, and the shock was felt all over the Empire and recorded by all the seismographs of the world. The largest width of the vibration reached to about 8 inches,

Digitized by Google

and the duration of the quake, as recorded by the seismograph in the laboratory of the Tokyo Imperial University, was over three and a half hours.

As to the casualties and damages caused by the earthquake and fire a variety of reports is published. The statistics here given are made out of those published by the Extraordinary Earthquake Rescue Bureau of the Department of Home Affairs, and those given in the Empire Statistic Year Book published by the Government.

DAMAGES TO BUILDINGS

(Earthquake Rescue Bureau Figures)

Damage	Number	Percentage
Totally burnt	381,090	54.9
Half burnt	517	0.1
Completely damaged	83,819	12.1
Half damaged	91,233	13.1
Carried off by tidal waves	1,390	0.2
Partly broken	136,572	19.6
Total	694,621	100.0

Of the above Tokyo had 354,453 houses damaged (51%), or 73.4% of the total number of houses in the city, while Yokohama had 94,882 houses destroyed (13.7%) or 95.9% of the total number of houses in the city.

CASUALTIES

(Figures from Empire Statistic Year Book and other statistical publications)

	Total	Men	Women	Proportion per 100 population in the district
Killed	44,279	20,953	23,326	0.88
Severely wounded	16,514	9,406	7,108	0.14
Wounded	35,560	20,865	14,695	0.34
Total	96,353	51,224	45,129	0.86

The number of persons killed is usually said to have reached over 100,000, and the Earthquake Rescue Bureau figures give 91,344. But the later statistics given by the Government in the Empire Statistic Year Book seems to be more correct. Of the total number there given as killed, 28,708 were crushed, 15,450 burnt in the ensuing fire, and 121 were drowned by the tidal waves.

No authoritative survey was made in regard to the loss of property and a variety of amounts is given as estimates. Most of them, however, are necessarily exaggerated. But taking the number of destroyed households, the average individual wealth and other factors as guides, the total amount of the loss may be safely said to have reached approximately ¥2,550,000,000.

Earthquakes of 1933 The biggest quake of the year occurred in the Sanriku district at 3:31 A. M. March 3. The district, which covers the Pacific coast line of three northeastern prefectures, Miyagi, Iwaté and Aomori, had often been washed by tidal waves due to seismic activities at the sea bottom, the severest loss of life being experienced in 1896. The people were, therefore, fully aware of possible tidal waves when they felt the first shock and immediately hurried to the hills, but the waves overtook them within half an hour or so, drowning 2,935 people and carrying away 13,172 houses, together with over 15,000 fishing boats. (These figures are subject to future correction). The number of casualties was but 10% of those of the 1896 quake, but the area covered and the destruction caused by it was greater. Ninety per cent. of the reconstruction work had been completed by the first anniversary.

Formosa Earthquake in 1935 On April 21, 1935 an earthquake struck Shin-

Digitized by Google

chiku and Taichu prefectures, Taiwan (Formosa). The shock suddenly began at 6:2′ 17″ A.M. (Taiwan time or 7:2′ 17″ A. M. in Japan proper) and lasted nearly one hour. The epicentre was at a point about 10 kilometres below the surface at the mouth of the Daiankei near the town of Taikō, Taichū. The width of the vibration reached from 8 mm. to 16 mm. and the shock was especially strong in a limited district because it occurred at a comparatively shallow spot. Records tell that Formosa experienced big quakes in 1655, 1720, 1722, 1861 and 1867, and this was 46th quake after 1868 and is said to have been the largest so far as the damages are concerned, the statistics of which follow :

DAMAGES AND CASUALTIES IN THE FORMOSA EARTHQUAKE IN 1935

(April 24, Ministry of Overseas Affairs Report)

Casualties :	
Killed	3,185
Severely wounded	9,215
Wounded	1,415
Missing	6
Total	13,821
Damages :	
Dwellings completely damaged	15,292
" half damaged	15,457
" greatly damaged	4,436
" partly damaged	3,380
Total	38,565
Other buildings completely damaged	574
" " half damaged	128
" " greatly damaged	104
" " partly damaged	184
Total	990

National Parks

On October 8, 1932, a committee of 11 headed by Baron Yoshiro Fujimura, which had been conducting investigations for a year under instructions from the Home Office, submitted a report recommending 12 places in Japan as worthy of preservation and development as national parks. They were (1) Mount Fuji and Hakoné, (2) Nikko, (3) Akan, (4) Daisetsusan, (5) Lake Towada, (6) the Japan Alps, (7) Yoshino and Kumano, (8) the Inland Sea, (9) Daisen, (10) Mount Aso, (11) Unzen and (12) Mount Kirishima.

There of them, i.e. the Inland Sea, Unzen and Mount Kirishima were formally announced as national parks by the authorities in March, 1934, and the five parks, Akan, Daisetsuzan, Nikko, the Japan Alps and Aso in November, 1934.

Descriptions of the national parks, decided and projected, follow :

Mount Fuji and Hakoné In the three prefectures of Yamanashi, Kanagawa and Shizuoka in the centre of the Mainland of Japan, the combination of the world-famous Mount Fuji, the five beautiful lakes at its foot and the hot spring resort of Hakoné is to be known as Fuji Park. Mount Fuji, superb, peerless and highest mountain of Japan proper, is known the world over for its beauty. Its perfect cone rises 3,773 metres above sea level. In July and August, crowds of pilgrims and others climb its sacred slopes to the summit.

Below Mount Fuji are the famous five Fuji lakes, all of which are visited by nature lovers because of their scenic beauty.

Few visitors to Japan fail to visit the Hakoné district, noted for its mountain scenery, invigorating climate, hot springs and places of general interest. The district, popularly known as Mount Hakoné, is the crater of an extinct volcano. Lake Ashinoko is famous for its reflection of Mount Fuji when that elusive peak is visible.

Nikko In the prefectures of Gunma, Fukushima, Tochigi and Niigata in the centre of the Mainland of Japan, 90 miles north of Tokyo, Nikko is famous the world over for its combination of art and nature. The gorgeous shrines and temples are as striking as its cryptomeria

Digitized by Google

avenue, the mountains, lakes and waterfalls. Lake Chuzenji, the largest lake in the proposed park, is extremely beautiful, and the Kegon waterfall, which serves as an outlet of the lake, is a most striking sight. Beside the lake stands Mount Nantai, which resembles in shape Mount Fuji. In inner Nikko are smaller lakes and also the hot spring district of Yumoto.

Akan Situated in Kushiro province on the Island of Hokkaido, this park contains a wide area of active volcanic mountains, imposing forests and lakes. Lake Mashu, one of the beautiful lakes below the range of volcanic mountains, lies within 10 kilometres of the Deshikutsu Hot Springs. The lake is nearly 20 square kilometres in area, and in its centre lies a small island.

Lake Kutsusharo, the largest of the group in Akan Park, measures 76.22 square kilometres in area, with the beautiful island of Tomoshiri in its centre, 12 kilometres in circumference. At the southern extremity of the lake is a small protruding strip of highland called Wakoto Peninsula, at the foot of which is Wakoto Hot Springs.

Lake Akan, probably the most beautiful of the Akan group, 11.86 square kilometres, has a zigzag shore and, being rich in changes, presents a very pleasing appearance. On the southwest of the lake rises Mount Oakan, an active volcano.

Akan Park is suitable for sightseeing trips of two or four days from the city of Kushiro.

Daisetsuzan The Great Snow Mountains district, in the centre of the Island of Hokkaido, presents a range of active volcanoes known as the Daisetsuzan Range. Because of the great height of the mountains, this is often called the Roof of Hokkaido. Surrounding the mountains are virgin woods over an area of 490,000 acres. The mountains form the source of the Ishikari River, the largest river on the island.

The Daisetsu volcanic range rises in more than 10 mountains, including Mount Tokachi and Mount Sangoku. Many lakes are found on the summits of the volcanoes. Mount Asahi, the highest mountain in the group and the highest in Hokkaido, is 2,290 metres above sea level. Its shape, resembling that of Mount Fuji and trailing far to the foot, is very beautiful to look at from a distance. From its summit can be seen on a fine day all Hokkaido, a magnificent view seldom equalled anywhere else.

Lake Towada In the Ohu district in Northern Japan, extending over the two prefectures of Akita and Aomori, the proposed Towada Park is distinguished by Lake Towada on the south and Mount Hakkoda on the north. Lake Towada, the third deepest in Japan, is 378 metres deep at the greatest depth. So clear is the water that one can see into it for 18 metres.

The lake, which is 401 metres above sea level is 78.02 square kilometres in area and 46.2 kilometres in circumference. In origin and scale, the lake resembles Crater Lake in America, but the beauty and variety of scenery here is said to be far superior to that of the American lake.

The Japan Alps (Chubu Sangaku or central mountains) Extending over the prefectures of Nagano, Gifu, Toyama and Niigata in Central Japan, the Hida range of mountains is called the Japan Alps after the European Alps because of its similarity in shape and scenery. Mounts Tsubakuro, Shirouma, Yari, Hodaka and Norikura are some of the high peaks, in the upper val-

Digitized by Google

leys of which snow may be found even in mid-summer. The region is an excellent place for summer mountain climbing and camping.

Kamikochi, probably the most popular spot in the region, is a flat valley in the shape of an S, 1,500 metres above sea level and surrounded by peaks towering an additional 2,000 metres. Through this valley runs the clear-watered Azusa River. The Kurobé Valley on the north is equally known for its majesty. Steep cliffs of great height stand on both sides, running for almost 80 kilometres from south to north. The region is the source of many beautiful streams and cascades which adorn and add colour to the mountain scenery.

Yoshino and Kumano On the Pacific coast of central Japan and extending over the prefectures of Wakayama, Nara and Miyé, the proposed Yoshino and Kumano Park has the dual beauties of mountains and the sea. The park area includes Mount Ominé, Mount Sanjo, Mount Odaigahara, the Hokusan Valley, Onigashiro and the beach.

Yoshino, noted for its cherry blossoms, and the other mountains in the Yoshino Range are from 1,000 to 2,000 metres above sea level. One of the highest of the 70 mountains is Mount Ominé, which is visited by 200,000 pilgrims annually. Mount Bukkyo, 1,915 metres above sea level, the highest peak in the region, commands on a fine day a striking view over the surrounding country. The sea coast within the area extends 80 kilometres. At the southern extremity of the Ushio Promontory stands a 63-foot lighthouse. Within the proposed park are the 800-foot Nachi waterfalls, the greatest in Japan, and 48 other waterfalls of varying sizes.

The Inland Sea This sea park lies between the Island of Shikoku and the Chugoku district on the Mainland of Japan, extending to the three prefectures of Hiroshima, Okayama and Kagawa and consisting of numerous islands of all shapes and sizes between Shodo-shima in the east and Abuto in the west. The seascape is ever changing as one voyages on its historic waters. Most of the trans-Pacific liners traverse it and occasional glimpses of its beauty can be had from the trains between Kobé and Shimonoseki. The sea is famous for its great variety of fish and their superior flavour.

The area between Kitaki Island and Shimotsui, dotted here and there by numerous islands of varying sizes, presents the best scenic view in the region.

The Island of Shodo, the largest of the group, is renowned for its scenic beauty, especially its crimson autumnal leaves. Yashima is known in history as the spot where the military clans of Genji and Heiké staged a decisive battle centuries ago, ending in the victory of the former.

Daisen In the prefectures of Tottori and Okayama, in Western Japan, the proposed Daisen Park is to be the only national park facing the Japan Sea. It includes, besides Mount Daisen, 1,713 metres above sea level, several peaks of similar height. Mount Daisen is called the Fuji of Hoki, because it resembles Mount Fuji in shape when seen from Shimané prefecture. While its western side is graceful, the northern is very imposing and majestic. Numerous rocks of huge size protrude from the ground. Wide plains around the mountain offer the best skiing ground in the Chugoku district.

Mount Aso In the centre of Kyushu, Aso Park consists in Mount Aso, which forms five peaks. Aso is an active volcano, with the larg-

Digitized by Google

est and most celebrated crater in the world. Being double-cratered, it has a huge depression measuring 16 kilometres from east to west and 20 kilometres from south to north, in the centre of which lies the central crater. Within the large crater are 11 villages where 50,000 people live. Their peaceful life is interesting when contrasted with the imposing figure of the mountain.

The five Aso peaks have characteristics all their own. Naka Peak has a crater which is very active and emits smoke which ascends furiously. Half way up Eboshi Peak are three hot-spring districts, Yutani, Suitama and Jigoku, 800 metres above sea level.

Unzen In Nagasaki prefecture, Kyushu, the renowned sulphide hot springs of Unzen, discovered in 1661, annually attracts many foreigners and Japanese. Unzen is famous for the medicinal properties of its waters. It is regarded as the best summer resort in Kyushu and is also visited for its wild cherry blossoms in spring, its splendid azaleas in May, its maple foliage in autumn and its celebrated "Silver Thaw" in winter, when trees and shrubbery are coated with ice.

Unzen, consisting of the lower peaks of Unzen, Nodaké, Takaiwa, Kusenbu, Torikabuto, Azuma, Hachimaki, and Bizan, has a feminine beauty of mountain scenery in contrast with the masculine grandeur of Mount Aso.

Mount Kirishima In the prefectures of Miyazaki and Kagoshima, Kyushu, the proposed Kirishima Park consists of 22 gracefully shaped volcanic mountains with characteristic craters, lakes, plains, woods and forests. The view from the mountains extends as far as Sakura Island in Kinko Bay, and that toward Mount Aso and Unzen in the distance is extremely beautiful. Kirishima is also rich in folklore, which gives it a touch of romance.

To have the best view, one must go up Mount Karakuni, the highest peak in the group, 1,700 metres above sea level. The woods turn into slopes and farther on comes a huge plain. The crater lake is soon reached, and hence a steep road leads to the summit. Three hours of walking are needed to reach Mount Takachiho. In the neighbourhood of Shinnen and Nakadaké, wild azaleas bloom in May, turning the locality into a veritable flower garden.

CHAPTER II

POPULATION

General Survey

The outstanding aspects of the population of Japan are that it has virtually doubled in Japan proper in the past 60 years, that the excess of its birth rate over the death rate is one of the highest in the world, and that its density is such that the land within the Empire leaves scant room for expansion.

The third quinquennial national census, taken on October 1, 1930, showed a total population for the Empire of 90,396,043, exceeded in only the British Empire, China, the Soviet Union and the United States. Though lack of statistics makes it impossible to trace the growth with any accuracy from early days, it has been variously estimated that in the 7th and 8th centuries the population ranged between 5,000,000 and 8,000,000 or 9,000,000. Figures compiled at regular intervals between 1721 and 1846, despite their understatement of the actual population because of certain known omissions, indicate comparative stability at about 26,000,000 for more than a century preceding the Meiji Restoration.

The first estimate of population after the Restoration, made in 1872, was roughly 33,000,000. By 1889, the total was 40,000,000, and the 50,000,000 mark was passed in Japan proper about 1909. Each decade showed an accelerated increase:

1870–1880	5%
1880–1890	7.6%
1890–1900	10%
1900–1910	12%
1910–1920	13%
1920–1930	15%

This increase, it is to be noted, started with the opening of the country to world commerce and paralleled Japanese economic expansion. As means of subsistence gained, so did the size of the population. The death rate did not drop appreciably until recent years, but the birth rate, in contrast with that in other leading nations, became higher, jumping from 17 per 1,000 of population in 1872 to 32.35 per 1,000 in 1930, with a peak of 36.2 in 1920. In no other important nation, unless it be the Soviet Union, is the rate so high.

With a total area of 382,314 square kilometres, Japan proper has a population density of 169 persons to the square kilometre.

In 1930 the average number of the members of a household in Japan proper was 5.1. It differs according to districts. In the eastern districts, from Toyama, Nagano to Hokkaido, it was from 5 to 6, the northeastern prefectures heading the list with their average of 6. In the western districts, that is to say, Ishikawa, Aichi, Kyoto, Osaka, Chugoku (western prefectures of the Main Island), Shikoku, Kagoshima prefecture and the Loochoos, it was below 5, the lowest being Kyoto, Osaka and Chugoku districts. Classified in accordance with prefectures, those prefectures which have big cities show a much smaller average, Tokyo being 4.8, Osaka 4.6, Kyoto and Hyogo (Kobé) 4.7. This phenomenon is evidently occasioned by the social and economic conditions in city life which necessitate a small-family system.

POPULATION OF THE EMPIRE

According to the census of October 1, 1925

	Total population	Male	Female	Population per square kilometre	Males to 100 Females
Empire	88,456,929	42,209,100	41,247,829	124	102.3
Japan proper	59,736,822	30,013,109	29,723,713	156	101.0
Korea	19,522,945	10,020,943	9,502,002	88	105.5
Formosa	3,993,408	2,052,669	1,940,739	111	195.8
Karafuto	208,754	122,379	81,375	6	150.4
Kwantung Province and South Manchuria Railway Zone	1,054,074	644,491	409,583	283	157.4
South Sea Mandated Islands	56,294	30,100	26,194	26	114.9

According to the census of October 1, 1930

	Total population	Male	Female	Population per square kilometre	Males to 100 Females
Empire	90,896,043	45,675,654	44,720,389	134	102.1
Japan proper	64,450,005	32,390,155	32,059,850	169	101.0
Korea	21,058,305	10,763,679	10,294,626	95	104.6
Formosa	4,592,537	2,353,288	2,239,249	128	105.1
Karafuto	295,196	168,532	126,664	8	133.1
Kwantung Province and South Manchuria Railway Zone	1,328,011	809,044	518,967	355	155.9
South Sea Mandated Islands	69,626	37,929	31,697	32	119.7

The average rate of annual increase of population during the five years from 1925 to 1930 in Japan proper was 15.304 per 1,000; 15.361 in male and 15.247 in female. In Chosen it was 15.256, in Taiwan 28.352, in Karafuto 76.963.

The quinquennial increase of the population, 1925-1930

Empire	6,939,114	Kwantung Province and South Manchuria Railway Zone	273,937
Japan proper	4,713,183	South Sea Mandated Islands	13,332
Korea	1,535,360		
Formosa	599,129		
Karafuto	91,442		

INCREASE OF POPULATION OF JAPAN SINCE THE FIRST NATIONAL CENSUS OF OCTOBER 1, 1920

Year	Population of the Empire		Japan proper		
	Japan proper	Others	Births	Deaths	Natural increase
1920	55,963,053	21,025,326	2,025,564	1,422,096	603,468
1925	59,736,822	23,720,107	2,086,091	1,210,706	875,385
1929	62,938,200	24,131,124	2,077,026	1,261,228	815,798
1930	64,450,005	25,946,038	2,085,101	1,170,867	914,234
1931	65,366,500	25,354,311	2,102,784	1,240,891	861,893
1932	66,296,000	27,230,234	2,182,742	1,175,344	1,007,398
1933	67,238,600	—	2,121,253	1,193,987	927,266
1934	68,194,900	—	—	—	—

Note:—National census was taken three times quinquennially since 1920. For intercensal years figures on population are estimations.

Races of the Japanese Empire

The Japanese What constitutes the main part of the population of the Empire is the Japanese. Their number, according to the latest national census of 1930, reaches to about 64,400,000 (32,300,000 males and 32,050,000 females), most of whom occupy the main group of the Japanese archipelago, although they are also found scattered in almost any part of the Empire.

Of late, constant emigration and

Digitized by Google

immigration are taking place between Korea and Japan, but the main population of Korea is Korean and numbers about 20,000,000.

The Ainu inhabit Hokkaido, Chishima (the Kuriles) and the Japanese part of Karafuto (Saghalien).

Most of them are found in Hokkaido, especially in the province of Hitaka, their number being 16,000. In Karafuto there are about 1,500 according to the national census of 1925; formerly they lived scattered along the sea coasts of Karafuto, but the government policy made a point of collecting them in a few prescribed Ainu villages for the purpose of better protection. Those in Chishima are very few in number and do not exceed one hundred. In Hokkaido, as a result of daily contact with the Japanese, they are greatly mixed and are fast changing their customs and manners to accord with the fashion of the Japanese neighbours.

As to the position of the Ainu in the ethnic system, there is no consensus of opinion. It was, and still is, a conundrum in anthropology. Years ago the view that the Ainu formed a "Race Island" was put forward by Y. Koganei.

Gilyaks whose home is in the Amur region of Siberia, are also found along the Poronai River in the southern part of the Japanese possession in Saghalien. They call themselves "Nickbun" and were reported in 1925 to be 77 in all, 40 being males and 37 females. Their affinity with other races is not clear, and they are simply classed as one of the palae-Asiatics.

The Orokes who inhabit the same region in Saghalien as the Gilyaks, are also immigrants from the mainland of Asia. They are a branch of the Tungusic group, but are said to show a considerable influence of the Ainu, Gilyaks and also of the Russians.

The inhabitants of Formosa may be roughly divided into two groups, one is chiefly made up of the Chinese immigrants from Kwantung and Fukien provinces, and occupies the lowland districts and the western half of the island; and the other is made up of the wild hill-tribes inhabiting the mountainous eastern half, and is the more aboriginal of the two. These, on the basis of physical anthropology, ethnology and linguistics, are usually subdivided into eight tribes, namely: Taiyal, Seddaka, Saiset, Tsuou, Bunun, Paiwan, Ami and Yami. They are estimated to be about 130,000 in number and to belong either to Malay, or to the Indonesian family.

The Natives of Micronesia Micronesia which is under our mandatory administration, consists of innumerable small islands, some of which are uninhabited; hence, the native population is only about 49,000. The natives of Saipan, Palau, Yap, Truk, Ponape, Kusaie, Jaluit, etc., constitute the main part of the population. They are usually divided into two ethnic groups. One is known as the Chamorros and is chiefly found in Saipan, although some have emigrated to the island of Palau and Yap, and comprises about 2,800 in all according to the census of 1923. The other, commonly known as Kanakas, and found scattered in almost every island, is estimated at 46,000 in number.

In addition, it may be said that in the Ogasawara group of islands known as the "Bonin" (corruption of "Mujin" or "Bunin"=uninhabited) there are the naturalized descendants of European and American fishermen, Italian, English, Portuguese, etc., numbering about 120 and these form a sort of foreign settlement of their own.

Age Distribution

Figures for 64,067,050* persons residing in Japan proper show that those less than 14 years of age, termed juveniles, constitute 36.7% of the population; those from 15 to 59 inclusive, termed productives, 55.9%, and those of 60 or more, termed the aged, 7.4%. Of the males, 36.5% are juvenile, 57% productive and 6.5% aged; of the females, 36.9% are juvenile, 54.8% productive and 8.3% aged. Though males exceed females at birth, mortality among them is higher up to the age of 5. Between the ages of 5 and 34, female mortality is the greater, but with the latter age male mortality again takes the lead.

In the decade between 1920 and 1930, the number of juveniles per 1,000 of population increased by two, productives gained by six and the aged decreased by eight. Despite this tendency of the productive group to become larger, it still carries in Japan a much heavier burden than the productive groups in other countries, as is indicated in the following compilation of the general age groups per 1,000 of population:

*Note: The figures do not cover the full population because they are made out tentatively by the sampling method for the benefit of the public on the basis of a certain number among all the reports sent into the Statistics Bureau. The complete figures are not yet available.

DISTRIBUTION OF JUVENILES, PRODUCTIVES AND THE AGED

Age[1]		Total	Males	Females	Males to 100 Females	Per 1,000 of Total	Per 1,000 of Males	Per 1,000 of Females
		64,067,050	32,294,890	31,772,160	101.65	—	—	—
Juveniles	0–14	23,502,060	11,780,060	11,722,000	100.50	367	365	369

Vocational Distribution

According to the census of 1920, the percentage of persons engaged in agriculture was 48% of the entire population, industry 19%, commerce 13%, and other occupations below 10% each.

The complete figures of the 1930 census are not yet available; but the Statistics Bureau issued the following tentative table:

Living on proceeds from property, investment, etc.	193,010	129,010	64,000	6	10	3
Children, the aged and unemployed	34,653,490	13,076,360	21,577,130	994	990	997

Sex Distribution

As a whole, males slightly outnumber females in Japan proper but by a considerable margin in the colonies, as the following table indicates. Between rural and urban areas, there is a difference in this respect. Females exceed males in the rural districts of Japan proper, and in the cities the proportion of males to females is much higher than in the country as a whole. The following table gives the ratio of males to 100 females in Japan proper as recorded in the quinquennial censuses :

	Whole area	Rural areas	Cities	Cities above 100,000
1920	100.4	98.7	108.7	112.6
1925	100.0	98.2	107.6	111.3
1930	101.0	99.2	107.9	110.6

In Chosen, Taiwan and the Kwantung Leased Territory, the same fact is observed, the ratio of males to females being higher in the cities than in the whole areas, but it is not so among the Japanese elements in these colonies. Though Japanese males out-number females in both rural and urban districts, the excess is less in the cities. Karafuto is an exception to the general rule. The ratio of males to 100 females in the colonies is as follows :

	Total		Japanese		Natives	
	Whole area	Cities	Whole area	Cities	Whole area	Cities
Chosen[1]	103.9	107.7	107.8	106.2	103.2	104.6
Taiwan	105.1	108.9	117.0	115.4	103.6	102.5
Kwantung	155.9	190.8	107.2	105.6	163.1[2]	263.6[2]
Karafuto	133.1	119.8	—	—	—	—

1. For Chosen and Taiwan, the figures are for the end of 1930; for Kwantung and Karafuto, October 1, 1930.

2. A few foreigners are included.

Digitized by Google

The following tables show the rate of marriages, divorces and births, in Japan proper, in the latest decade.

Marriages and Divorces

In 1933 the number of marriages in Japan proper was 486,058, a decrease of 29,212 compared with the previous year. The number of marriages per 1,000 population was 7.23, or 0.54 lower compared with the previous year, regaining the general trend of recent years, which is decidedly on the decline. The number of divorces in the same year was 49,282, or 2,155 less than in 1932. The number of divorces per 1,000 population was 0.73 or 0.05 lower than the previous year. Before 1920 the number of divorces surpassed the 100,000 mark in a year and the proportion per 1,000 population was from 2.0 at the lowest to 3.0 at the highest, but it has kept a rate lower than 1.0 since 1920.

MARRIAGES AND DIVORCES

Year	Marriages	Divorces	Proportion per 1,000 population		Year	Marriages	Divorces	Proportion per 1,000 population

Births and Deaths

The natural increase of population has become greater with the advance of years. For several years since 1910 the natural increase kept to the 700,000 mark. In 1916 and 1917 it decreased a little, and in 1918 it reached the lowest figure of 300,000, largely due to the prevalence of a severe influenza epidemic. In 1919, however, the increase regained, reaching the 500,000 mark, and it continued to increase till the 940,000 mark was attained in 1926. There were ups and downs since, but 1932 was a record year, registering an increase of 1,007,000. It was for the first time that the million mark was attained.

1933	31.55	1.70	17.76	13.79

Expectation of Life

The following table gives average expectation of life of Japanese people for both sexes calculated at the Bureau of Statistics in the Cabinet based on the vital statistics for a period from 1921 to 1925. The average expectation of life may also be called the average span of life. It means the average length of years during which persons of various age

Digitized by Google

is expected to survive. Of course, the length of life of any individual person, or state of his health in the future may not be predicted by the following table alone, but it may serve to give the general idea for the study of the problem :

Age	Males	Females	Age	Males	Females	Age	Males	Females

99 ,,	0.99	0.98	100 ,,	0.83	0.89	101 ,,	—	0.77

In the following table is given the comparison of figures in the above table; (−) indicates the decrease over the corresponding figures for the period from 1908 to 1913.

Age	Males	Females
Under one year	(−) 2.19	(−) 1.53
Five years	(−) 2.22	(−) 1.45
Ten years	(−) 2.29	(−) 1.51
Twenty years	(−) 1.96	(−) 1.29
Thirty years	(−) 1.72	(−) 1.08
Forty years	(−) 1.69	(−) 0.94
Fifty years	(−) 1.59	(−) 0.89
Sixty years	(−) 1.41	(−) 0.87
Seventy years	(−) 1.15	(−) 0.84

The expectation of life has, on the whole, declined.

Average Age of Death In the following table are given the average age of males and females who have died since 1886 :

Year	Males	Females
1886	38.13	38.91
1902	32.65	33.70
1912	31.60	32.17
1922	31.71	32.10
1923	31.43	31.68
1924	32.22	32.65
1925	32.15	32.29
1926	32.24	32.55
1927	32.30	32.91
1928	32.83	33.06
1929	32.57	33.27
1930	33.80	34.46
1931	33.74	34.50
1932	33.56	34.34

Urbanization

As in other countries where industry is of importance, Japan has experienced a shift of population from the countryside to the towns and cities. Concurrently, communities have amalgamated to form larger units. The following tables show the trend toward larger urban centres; the first, the increase in the number of communities of large population, and the second, the increase in the proportion of the population residing in these larger communities. For 1920, 1925 and 1930, the figures are based on the national censuses of these years, but the earlier figures depend on less comprehensive statistics compiled by local authorities.

NUMBER OF CITIES, TOWNS AND VILLAGES CLASSIFIED

According to Population

	1930	1925	1920	1913	1908	1903	1898

Above 100,000	178.2	146.3	120.7	107.7	107.0	92.1	77.0

1. For administrative purposes, all of Japan proper is divided into cities, towns and villages, persons residing in what would be known as rural districts in other countries belonging, as the case may be, to the nearest cities, towns and villages.

In September, 1934, there were 125 cities in Japan proper, which meaning an increase of 4 every year since the 1930 census. According to the estimate on October 1, 1933, the number of major cities which have more than 100,000 population was 34, including 4 cities which have more than 1,000,000, Tokyo leading others with 5,663,350. The total urban population comprises 21,568,000 or 31.6 per cent. of the population of Japan proper. The rapid growth of cities may be proved from the fact that the rate of increase of population in cities is much higher than that of Japan proper, as is shown below:

Digitized by Google

	Population		Quinquennial Increase		Rate of Increase	
	Japan proper	Cities	Japan proper	Cities	Japan proper	Cities
1920	55,963,053	13,909,805	—	—	—	—
1925	59,739,822	16,606,809	3,773,769	2,697,504	6.7	19.39
1930	64,450,005	19,489,405	4,713,183	2,882,596	7.9	17.06
1933	67,238,600	21,568,000	2,788,595	2,128,600	—	—

If the rate of increase for 3 years between 1930 and 1933 keeps up for coming two years, the quinquennial increase of population in 1935 will be 4,647,658 for Japan proper and 3,546,666 for cities, the rate of increase 7.6 per cent. and 18.2 per cent. respectively.

NUMBER OF CITIES, TOWNS AND VILLAGES IN JAPAN PROPER
(1889—1933)

	Cities	Towns	Villages
1889	39	715	12,632
1898	52	1,169	13,557
1906	66	1,164	11,283
1913	69	1,246	11,038
1920	83	1,366	10,782
1925	100	1,510	10,451
1930	109	1,625	10,180
1933	125	1,670	9,784

A village is an administrative unit consisted of several villages.

Foreign Residents

The number of foreign residents in Japan proper, for the past five years has been as follows:

Year	Diplomatic and consular corps	Total	Males	Females
1929	370	38,829	27,972	10,857
1930	361	40,290	28,612	11,678
1931	390	28,317	19,655	8,662
1932	371	26,885	18,615	8,270
1933	374	29,268	19,764	9,504

Information given with the 1933 figures shows 10,136 foreigners engaged in commerce; 2,453 in professional work; 1,514 studying; 1,557

Digitized by Google

in mining and manufacturing; 149 in transportation; 3 in agriculture and forestry; 1 in fisheries; 566 in various other occupations, and 12,889 without occupations.

The following table classifies the foreign residents according to countries of origin:

Emigration

History Though there are records of Japanese having gone abroad for trade and residence in the latter years of the 15th century and the first half of the 16th century, the rigid laws against leaving the country during the period of seclusion, from 1636 to 1858, reserved the problem of emigration for modern times. As a result of negotiations between the Japanese Government and the Hawaiian Consul in Yokohama, 153 emigrants went to Hawaii in 1868 to work on sugar plantations. The venture was a failure, however, and not until 1885, after the visit of King Kalakaua of Hawaii to Japan in 1881 and the conclusion of treaties regarding travel, emigration of labourers and navigation, was there further emigration to the islands. In this year, 951 went. Their success encouraged an increase in the ensuing period, and by 1894 approximately 30,000 Japanese had gone.

Because of the rapid development of the emigration business, the Government now turned it over to private companies, which soon became numerous. Regulations to safeguard the interests of the emigrants were enacted in 1896. The companies sent 10,000 to Hawaii and about 1,000 each to Australia and Canada in 1897 and 23,000 to Hawaii, 3,000 to the United States, 1,700 to Canada, 790 to Peru and about 2,500 to other countries in the following year. But the annexation of the Hawaiian Islands by the United States in 1898 and establishment of the Territorial Government in 1900, brought application of the American law against the entry of contract labourers, which dealt a great blow to the companies.

By 1904, the movement of Japanese from Hawaii to the mainland of the United States had assumed sizable proportions, as had emigration to that country directly from Japan. In the so-called Gentlemen's Agreement, signed in 1908, Japan agreed to restrict the issue of passports to nationals wishing to enter the United States. The United States Supreme Court decided in

Digitized by Google

1922 that Japanese are ineligible for citizenship, and two years later the Quota Immigration Act was passed, containing a clause denying the right of entry into the United States for permanent residence of any person not eligible for citizenship. Australia, New Zealand, South Africa and Canada also provided, by various methods, for exclusion of Japanese.

These obstacles to entry into the Anglo-Saxon countries had two results, first, an abrupt decrease for a few years in the number of emigrants and, second, the discovery of new outlets. Several South American lands, notably Brazil, offered inducements. The Government adopted a positive polity of sending emigrants to quarters where they were not unwelcome, and in 1921 a subsidy was given to the Overseas Enterprise Company (Kaigai Kogyo Kaisha) to arouse interest in emigration. Encouraged by this change in policy, emigration associations sprang up one after another in the prefectures, and plans were made to purchase tracts of land in Brazil for colonization. To such land, the Shinano Emigration Association (Nagano prefecture) sent 450 emigrants in 1925.

Enactment of the Emigration Association Law in 1927 resulted in an increase of "independent" emigrants, quite different from the labour-contract emigrants which had constituted the bulk in earlier years. Prefectural emigration associations set up under the provisions of this law organized a federation which co-ordinated the buying of Brazilian land. A home for emigrants was opened in Kobé, the main port of embarkation. Companies specializing in South American colonization came into being. Part of the reason for establishing the Ministry of Overseas Affairs in the Government in 1929 was to provide an agency for administration and control of matters pertaining to emigration and colonization.

Movement The following table shows the movement of Japanese travellers and emigrants during the past 10 years:

NUMBER OF PASSPORTS ISSUED

Year	Total	To men	To women
1924	27,032	17,837	9,195

The Kwantung Leased Territory and the South Manchuria Railway Zone, the South Sea Mandated Islands, Manchoutikuo, and China are in a special category as regards Japanese colonization, and details of the Japanese residing in these regions will be found in other chapters. The following paragraphs, however, summarize the status of the settlers in the principal lands open to Japanese, other than those above mentioned:

Brazil The Japanese first went to Brazil in 1908, but only in the past decade has the number leaving annually for this destination been of any volume. Of the 157,476 settlers registered at the end of October, 1933, over 150,000 were in the State of Sao Paulo, the majority working on coffee plantations. They are expected eventually to establish themselves as independent farmers. Those who left Japan with adequate capital and superior agricultural skill already own extensive tracts of land. The growing of potatoes around Sao Paulo City by Japanese is particularly notable.

Argentina Though the Japanese first went to Argentina in 1907, only a few have followed. Of the 5,334 residing there in 1933, over 2,000 were in Buenos Aires, the capital, where they are engaged mainly in industry and business. Those on farms cultivate cotton, tea, cocoa and cinchona bark, from which quinine is prepared.

Peru Japanese emigration to Peru dates from 1899. In October, 1933, there were 21,281 residents, of whom more than 17,000 were in Lima and most of the others in or near Callao and other cities. Majority of them are engaged in commerce while about 2,000 farmers, some of whom own their own land, have mostly specialized in the cultivation of cotton, in which several Japanese corporations are interested. Argentina offers opportunities for development of sugar cane cultivation, forestry and stock raising by Japanese.

Other South American Countries Chile, Colombia, Bolivia, Paraguay and Venezuela have no restrictions on the entrance of the Japanese. As the soil in these countries is suited

Digitized by Google

for various agricultural enterprises, the Japanese Government is encouraging emigrants. The last statistics show 635 Japanese in Chile, 627 in Bolivia and 5 in Paraguay.

Mexico After the arrival of the first emigrants in 1897, Mexico gave promise of becoming an important outlet. About 1906, increasing numbers went. Endemic fever and repeated revolutionary outbreaks, however, spelled ruin for most of the Japanese enterprises, and of recent years the emigration to this destination has been slight. In 1933, 5,297 Japanese resided there, most of them engaged in agriculture, horticulture and cattle raising.

Philippines More Japanese emigrants now go to the Philippine Islands than to any other country except Brazil. Settlement there began in 1900, and on October 1, 1933, the Japanese residents numbered 20,400 of whom 4,179 were in Manila, 1,378 elsewhere in Luzon and 12,592 in Cotabato and Davao. In Mindanao island, the large number of Japanese is accounted for by the large-scale cultivation of hemp, an enterprise originated by them. Many other Japanese in the Philippines are engaged in the fishing and building trades.

Other South Sea Countries Most of the Japanese residing in the Straits Settlements, the Malay States, British Borneo, the Dutch East Indies, India, Siam and French Indo-China are representatives of companies and clerks in banks, though many are small merchants and domestic servants. In the Dutch East Indies and the Malay States, Japanese have extensive rubber and cocoa plantations, and in Java they cultivate hemp, sugar cane and tea. As native and Chinese labour is so cheap, the number of Japanese contract labourers in this region is negligible.

On October 1, 1933 there were 5,729 Japanese residents in the Malay States and the Straits Settlements; and 6,949 in the Dutch East Indies.

1933 Emigrants

In 1933 the number of emigrants to foreign countries except China and Manchoukuo reached 27,317, an increase of 8,289 over that of the previous year. Of the total, 23,299, or 85%, went to Brazil, 1,095 to the eastern U.S.S.R., 468 to the Dutch East Indies, 941 to Philippine Islands, 481 to Peru, 322 to the Straits Settlements and Malay.

The age classification of the emigrants is as follows:

Age	Total	Men	Women
1— 4	3,112	1,575	1,537
5—19	9,901	5,693	4,208
20—29	7,517	4,417	3,100
30—49	5,533	3,455	2,078
50 & above	1,254	779	475
Total	27,317	15,919	11,398

A majority of the emigrants were farmers and farm labourers, these comprising 24,176 or 89%, of the total and 95% of those who had occupations as shown in the following table:

EMIGRANTS CLASSIFIED ACCORDING TO OCCUPATION IN 1933

Occupation	Total	Men	Women
Farmers and farm labourers	24,176	13,444	10,732
Industrials and workers	118	91	27
Engaged in Mining	884	875	9
,, Fisheries	317	292	25
,, Communication and transportation	10	10	0
,, Commerce	823	663	160
House workers and cooks	75	26	49
Day labourers	269	239	30
Officials, etc.	270	101	169
Unoccupied (mostly children)	375	178	197
Total	27,317	15,919	11,398

Digitized by Google

1922 that Japanese are ineligible for citizenship, and two years later the Quota Immigration Act was passed, containing a clause denying the right of entry into the United States for permanent residence of any person not eligible for citizenship. Australia, New Zealand, South Africa and Canada also provided, by various methods, for exclusion of Japanese.

These obstacles to entry into the Anglo-Saxon countries had two results, first, an abrupt decrease for a few years in the number of emigrants and, second, the discovery of new outlets. Several South American lands, notably Brazil, offered inducements. The Government adopted a positive polity of sending emigrants to quarters where they were not unwelcome, and in 1921 a subsidy was given to the Overseas Enterprise Company (Kaigai Kogyo Kaisha) to arouse interest in emigration. Encouraged by this change in policy, emigration associations sprang up one after another in the prefectures, and plans were made to purchase tracts of land in Brazil for colonization. To such land, the Shinano Emigration Association (Nagano prefecture) sent 450 emigrants in 1925.

Enactment of the Emigration Association Law in 1927 resulted in an increase of "independent" emigrants, quite different from the labour-contract emigrants which had constituted the bulk in earlier years. Prefectural emigration associations set up under the provisions of this law organized a federation which co-ordinated the buying of Brazilian land. A home for emigrants was opened in Kobé, the main port of embarkation. Companies specializing in South American colonization came into being. Part of the reason for establishing the Ministry of Overseas Affairs in the Government in 1929 was to provide an agency for administration and control of matters pertaining to emigration and colonization.

Movement The following table shows the movement of Japanese travellers and emigrants during the past 10 years:

NUMBER OF PASSPORTS ISSUED

Year	Total	To men	To women
1924	27,032	17,837	9,195
1925	22,176	15,628	6,548
1926	28,619	20,017	8,602
1927	31,177	21,364	9,813
1928	34,008	23,191	10,817
1929	37,990	25,689	12,301
1930	38,383	26,589	11,794
1931	27,144	19,803	7,341
1932	30,757	19,941	10,816
1933	42,451	27,163	15,288

EMIGRANTS

Year	Leaving Japan	Returning to Japan
1924	13,098	12,579
1925	10,696	13,918
1926	16,184	14,549
1927	18,041	14,735
1928	19,350	15,004
1929	25,704	14,073
1930	31,829	14,546
1931	10,384	12,965
1932	19,033	13,170
1933	27,317	14,141

The destinations of those leaving Japan in recent years have been:

	1928	1929	1930	1931	1932	1933
Brazil	2,077	4,435	2,685	5,565	15,092	23,299

still older manuscripts which furnished them with materials. But of these no trace remains. These two books which are commonly called "Ki-Ki" collectively contain traditions long cherished by the islanders, although there are many fictions mixed or intermingled in them. Careful study of these records exposes the ancient life of the Japanese after the New Stone Age and at the beginning of the agricultural period, if we use a little imagination to help out our store of ascertained facts.

Beginning of Shintoism People in this age formed large families and the clan system prevailed. In many families the succession followed the maternal side, clan councils were called and patriarchs were elected. Shintoism, though in the most undeveloped state, was already a creed; people revered their forefathers and worshipped their own family gods, and the members of each clan were united in the worship of their own particular god, gaining thereby a more vivid feeling of belonging to one and the same blood. In the Imperial House, the Emperor Jimmu instituted religious ceremonies for his Divine Ancestors, who became the objects of worship of the National Shintoism in later ages, and his successors followed his example and prayed to the gods for the welfare of their beloved nation. Before Chinese models were adopted the ancient government of Japan was very simple, and ritual observances and public affairs were one, as the Japanese "Matsuri-goto" may mean either the administration of state affairs or religious ceremony.

Political Affairs In 87 B. C., the Emperor Sujin sent armies to the remoter central and western districts and subdued all the opposing tribes. In the first century A. D., the Emperor Keiko sent Yamato-Takeru or some generals to the farthest west and east, and suceeded in bringing the whole land under his sway, sending his sons to be the rulers over those subdued districts, and the Emperor Seimu divided the whole land into territories and prefectures for the convenience of governing them. Sushin and Suinin carried out plans for stimulating industry and commerce, and the nation became rich and the national power was much augmented, so that the small kingdoms in the Korean peninsula came one by one to be its tributaries. It was through these small Korean kingdoms that a knowledge of the religion and culture of the greater Oriental nations first reached Japan. In 285 A. D. Confucianism was officially introduced into the country, with its important moral precepts concerning righteousness, loyalty, filial piety, and love. In 552, during the reign of the Emperor Kimmei, the public introduction of Buddhism with its teachings on cause and effect opened up new vistas in religious and philosophic thought.

Civilization Introduced From the remains of this period we can infer that the Japanese people whose settlements extended from Kyushu to districts near the present-day Kyoto had risen above barbarous life long before the first century of the Christian Era. Their shell-mounds contain many bronze utensils which correspond to the Chinese productions of the Han Dynasty (206 B.C.–221 A.D.). The Do-Taku which seem to have been used as musical instruments or kept as a kind of treasure were found in the districts extending from the western end of the Main Island to Totomi and Kaga provinces near Nagoya and in Shikoku Island. They were found with the remains of the so-called Yayoi style which characterizes the works of the original Japanese as distinguished from the

Digitized by Google

Ainu, and tell of early Japanese intercourse with the continental countries. The Do-ken or bronze swords of different shapes were found in the provinces of Kyushu, districts around the Inland Sea, the provinces of Aki, Izumo, Owari and Shinano and in Shikoku Island.

Japan had tributaries in Korea at this period, but, at the same time, heads of large families in Kyushu and Loochoo had some relations with the Han Dynasty as local tributary lords. We have good reason to believe that considerable numbers of continental people came to the islands either individually or in large bodies, and the civilizations of China, India and Korea had been constantly introduced to the islanders or brought in by the immigrants themselves so that there had really been several centuries of preparation before the formal or official reception of Chinese books and culture in the 3rd century at the Central Court in Yamato province.

Japanese Traits In those days Japanese characteristics and tribal traits were already established. The mild climate and beautiful natural features of the islands and the surrounding seas exerted ineradicable influences on the nature of the inhabitants. From such an early period the islanders, economically self-supplying and self-sufficient, enjoyed comparatively peaceful lives without much danger of being invaded by outside political powers. Consequently they became admirers of the realistic world, highly optimistic with pragmatic ideals; they had deep appreciation of natural life and a religious belief full of light. Their mode of action was sprightly, innocent and active. Loyalty to one's lord and filial piety were their two main principles of morality fostered from the remotest past; next in importance came valour in the highest sense of the term. There was no distinction in the position of the sexes and able women assumed high places in public affairs.

Primitive Literature There were written numerous local histories and genealogies of the Imperial Court and clans, and stories of heroes of victorious battles were earnestly listened to in their gatherings. They had ballads and a crude form of poetry which later came to be called waka, the metrical arrangement being 5-7 or 5-7-7, instead of the later 5-7-5-7-7. The ideas expressed were simple and pure, mostly concrete, lacking in the abstract thoughts of later days, putting immediate feelings into metre. The subjects poeticized were women, wars, and saké, as is common with primitive people in other parts of the world, and poems which sung the beauty of natural sceneries were rare.

No Pastoral Life The islands, severed as they were from the continent, were unsuited for raising cattle, and the ancient Japanese people had no experience of a pastoral life. Excavation of mounds gives no indication of it, while the undeveloped legs of the Japanese seem to suggest something of their ancestral habits.

With the progress of agricultural life the oldest clan system which had no class differences began to undergo changes because of the increase of population and consequent need of new land. Clans began to separate into branches, the latter leaving the parent stock and going out to get new lands. In many cases land was obtained by violence and there arose the relation of master and subject. Blood relation among the people widened to local relation and there appeared ruling clan heads to control and represent the districts or provinces. Soon these ruling families began to keep hereditary power in their hands. The primitive

for various agricultural enterprises, the Japanese Government is encouraging emigrants. The last statistics show 635 Japanese in Chile, 627 in Bolivia and 5 in Paraguay.

Mexico After the arrival of the first emigrants in 1897, Mexico gave promise of becoming an important outlet. About 1906, increasing numbers went. Endemic fever and repeated revolutionary outbreaks, however, spelled ruin for most of the Japanese enterprises, and of recent years the emigration to this destination has been slight. In 1933, 5,297 Japanese resided there, most of them engaged in agriculture, horticulture and cattle raising.

Philippines More Japanese emigrants now go to the Philippine Islands than to any other country except Brazil. Settlement there began in 1900, and on October 1, 1933, the Japanese residents numbered 20,400 of whom 4,179 were in Manila, 1,378 elsewhere in Luzon and 12,592 in Cotabato and Davao. CHAPTER III

OUTLINE OF HISTORY

Ethnologic Beginnings

According to modern scientific research it seems almost certain that Japanese tribes lived on these Islands at least as early as 2,000 B.C., in the latter part of the New Stone Age. It seems probable that yellow folk from the mainland of Asia, the natives of some southern islands, and possibly some kind of white-skinned race from the northwest, drifted to the Japanese islands, where they found a milder climate and more fertile soil than in their homelands, and formed a mixed race which we may call the Yamato Tribe and their blood became so well blended in the course of time that many think the Japanese people, their descendants, to be homogeneous.

They lived mostly on seashores or riversides. Their shell-mounds are rich in relics of those early days. They dug caves in the hillsides and pits in the flat ground for their dwellings, used stone tools and lived on natural food such as game, fish and shell-fish.

In the 3rd century B.C. the Indo-Chinese brought rice to the islands and the natives learned to cultivate and eat it. By this time a primitive agricultural life must have begun, and according to one of the oldest Chinese records on Japan the islanders already had a knowledge of silk-making even in such a remote period. Four different styles of clothing seem to have been prevalent, that of the Ainu, Tunguse, Indo-Chinese and Huns respectively, although there were some tribes who went naked. Judging by the clay images or idols they left behind them, the Ainu clothes consisted of an upper and a lower garment, the upper garment of the women being open in front, while that of the men was not. The dress of the Tunguse much resembled the Korean in style and they were fond of using jewels or stone ornaments.

They lived in groups, forming villages which consisted in some cases of several hundred households. They seem to have had a primitive communal life, each tribe or group being firmly united by ties of blood and belief. But there had appeared as yet no political organization or system and there was a continual stream of immigrants from the continent. Clan and tribal fighting and alliances gave opportunity for mixing blood. By the beginning of the Christian Era the Ainu and the ancestors of the Japanese, mainly Tunguse by descent, gradually settled down on the islands, the former living in the north-eastern half and the latter spreading over the south-western half.

Age of Traditions
(660 B.C.–531 A.D.)

The period of 1,000 years from the Emperor Jimmu to the Emperor Keitai (who reigned from 507 to 531) may be called the Age of Traditions of Japan. The first book of history "Nihonshoki" (Japanese Annals) which was first compiled in the 28th year of the Empress Suiko, and the second oldest record "Kojiki" (Antiquities) which appeared about one hundred years later, tell of some

Digitized by Google

still older manuscripts which furnished them with materials. But of these no trace remains. These two books which are commonly called "Ki-Ki" collectively contain traditions long cherished by the islanders, although there are many fictions mixed or intermingled in them. Careful study of these records exposes the ancient life of the Japanese after the New Stone Age and at the beginning of the agricultural period, if we use a little imagination to help out our store of ascertained facts.

Beginning of Shintoism People in this age formed large families and the clan system prevailed. In many families the succession followed the maternal side, clan councils were called and patriarchs were elected. Shintoism, though in the most undeveloped state, was already a creed; people revered their forefathers and worshipped their own family gods, and the members of each clan were united in the worship of their own particular god, gaining thereby a more vivid feeling of belonging to one and the same blood. In the Imperial House, the Emperor Jimmu instituted religious ceremonies for his Divine Ancestors, who became the objects of worship of the National Shintoism in later ages, and his successors followed his example and prayed to the gods for the welfare of their beloved nation. Before Chinese models were adopted the ancient government of Japan was very simple, and ritual observances and public affairs were one, as the Japanese "Matsuri-goto" may mean either the administration of state affairs or religious ceremony.

Political Affairs In 87 B. C., the Emperor Sujin sent armies to the remoter central and western districts and subdued all the opposing tribes. In the first century A. D., the Emperor Keiko sent Yamato-Takeru or some generals to the farthest west and east, and suceeded in bringing the whole land under his sway, sending his sons to be the rulers over those subdued districts, and the Emperor Seimu divided the whole land into territories and prefectures for the convenience of governing them. Sushin and Suinin carried out plans for stimulating industry and commerce, and the nation became rich and the national power was much augmented, so that the small kingdoms in the Korean peninsula came one by one to be its tributaries. It was through these small Korean kingdoms that a knowledge of the religion and culture of the greater Oriental nations first reached Japan. In 285 A. D. Confucianism was officially introduced into the country, with its important moral precepts concerning righteousness, loyalty, filial piety, and love. In 552, during the reign of the Emperor Kimmei, the public introduction of Buddhism with its teachings on cause and effect opened up new vistas in religious and philosophic thought.

Civilization Introduced From the remains of this period we can infer that the Japanese people whose settlements extended from Kyushu to districts near the present-day Kyoto had risen above barbarous life long before the first century of the Christian Era. Their shell-mounds contain many bronze utensils which correspond to the Chinese productions of the Han Dynasty (206 B.C.–221 A.D.). The Do-Taku which seem to have been used as musical instruments or kept as a kind of treasure were found in the districts extending from the western end of the Main Island to Totomi and Kaga provinces near Nagoya and in Shikoku Island. Ainu, and tell of early Japanese intercourse with the continental countries. The Do-ken or bronze swords of different shapes were found in the provinces of Kyushu, districts around the Inland Sea, the provinces of Aki, Izumo, Owari and Shinano and in Shikoku Island.

Japan had tributaries in Korea at this period, but, at the same time, heads of large families in Kyushu and Loochoo had some relations with the Han Dynasty as local tributary lords. We have good reason to believe that considerable numbers of continental people came to the islands either individually or in large bodies, and the civilizations of China, India and Korea had been constantly introduced to the islanders or brought in by the immigrants themselves so that there had really been several centuries of preparation before the formal or official reception of Chinese books and culture in the 3rd century at the Central Court in Yamato province.

Japanese Traits In those days Japanese characteristics and tribal traits were already established. The mild climate and beautiful natural features of the islands and the surrounding seas exerted ineradicable influences on the nature of the inhabitants. From such an early period the islanders, economically self-supplying and self-sufficient, enjoyed comparatively peaceful lives without much danger of being invaded by outside political powers. Consequently they became admirers of the realistic world, highly optimistic with pragmatic ideals; they had deep appreciation of natural life and a religious belief full of light. Their mode of action was sprightly, innocent and active. Loyalty to one's lord and filial piety were their two main principles of morality fostered from the remotest past; next in importance came valour in the highest sense of the term. There was no distinction in the position of the sexes and able women assumed high places in public affairs.

Primitive Literature There were written numerous local histories and genealogies of the Imperial Court and clans, and stories of heroes of victorious battles were earnestly listened to in their gatherings. They had ballads and a crude form of poetry which later came to be called waka, the metrical arrangement being 5-7 or 5-7-7, instead of the later 5-7-5-7-7. The ideas expressed were simple and pure, mostly concrete, lacking in the abstract thoughts of later days, putting immediate feelings into metre. The subjects poeticized were women, wars, and saké, as is common with primitive people in other parts of the world, and poems which sung the beauty of natural sceneries were rare.

No Pastoral Life The islands, severed as they were from the continent, were unsuited for raising cattle, and the ancient Japanese people had no experience of a pastoral life. Excavation of mounds gives no indication of it, while the undeveloped legs of the Japanese seem to suggest something of their ancestral habits.

With the progress of agricultural life the oldest clan system which had no class differences began to undergo changes because of the increase of population and consequent need of new land. Clans began to separate into branches, the latter leaving the parent stock and going out to get new lands. In many cases land was obtained by violence and there arose the relation of master and subject. Blood relation among the people widened to local relation and there appeared ruling clan heads to control and represent the districts or provinces. Soon these ruling families began to keep hereditary power in their hands. The primitive

Digitized by Google

or natural system of common property was transformed to that of private property. Powerful clans had serfs as property and subordinate clans or subjects paid tribute.

Age of Foundation (532–709)

As mentioned above, by the 6th century A. D. Japanese social and economical conditions were well prepared for the reception and appreciation of the Chinese civilization of the brilliant age of the Sui and Tang Dynasties.

Political Events With religion, other things such as painting, sculpture and architecture were gradually introduced and in the sixth century Prince Shotoku-Taishi, striving for the promotion of learning, religion and art, tried his best to make a radical improvement in the state administration and in the social life of the people. His work was a forerunner of the Taika Reformation.

In the meantime, there arose troubles among the clans which had power in the Government and their conflict became greater with the advancement of civilization. Two of the most important of these clans, Soga and Mononobé, came into violent collision over the question of adopting Buddhism as the national religion, until finally the former got the upper hand. But the Soga family abused their power so greatly that they stirred up the opposition of Kamatari Fujiwara, a loyal subject, and Prince Naka-Ohyé, who later became the Emperor Tenchi. The Soga power was suppressed in the year 645; this was the first step to the Taika Reformation which followed.

Emperor's Power Reduced As a natural development land became divided among the Imperial house, the clans and the temples. The Imperial estates were obtained in various ways, and consisted of, firstly, land owned ever since the first rule of Jimmu; secondly, land newly cultivated by the farmers who served the august family; thirdly, estates presented by local nobles; and fourthly, memorial lands for the dead Imperial members. Clans owned their estates, either by natural right, conquest or as prizes for merit. A clan's estate might increase yearly to the extent that it took the form of a territory, and consequently the national unity under the Emperor was endangered.

Shinto shrines and Buddhist temples also possessed their own glebes which had been given them by nobles as offerings.

As regards cultivating or farming the land, it is said that it developed from communal to tenant-farming. The patriarchs in the country districts began to possess a great number of people and large estates and enrich themselves by the labour of their serfs. Their wealth gave them influence and power and they became really local lords. This state of affairs continued without much change till the Taika Reformation in the 7th century.

The old clan system allowed high officials of the Court and the powerful families in the provinces to exercise almost absolute power over their own territories. The emperors ruled the people indirectly, all the official positions being hereditary. This system gave birth to several political vices or abuses, and the Imperial authority became much reduced. The excesses of the Soga clan showed clearly the injurious effect of this system, and the necessity of ending it.

The Taika (Taikwa) Reformation When the Soga family were destroyed, the Emperor Kotoku started a plan for a reformation, appointing the Crown Prince Naka-Ohyé to the

Digitized by Google

head of the council which was composed of Kamatari Fujiwara, Kurahashimaro Abé and other great scholars of the time. The Crown Prince, with Kamatari at his right hand, studied the Chinese system of government and made plans for a revolutionary change of politics for the welfare of the people. Introducing from China the system of "nengo" or year-names, he called this period Taika or "Great Reformation" in the summer of 1305 from Jimmu or 645 A. D. This was indeed only seven days after the death of Soga. Japan has experienced three great changes in politics since the founding of the nation. The first was the Taika Reformation, the second the establishment of the Shogunate at Kamakura, 1192, and the third was the Meiji Restoration, 1868. In the second year of Taika the Imperial Edict of the Reformation was proclaimed. Some of its provisions were as follows:

(1) To bring all the private lands into public possession; (2) to divide the confiscated lands among the people, taking a census and fixing reasonable taxes; (3) to fix divisions of Kuni, Gun and Ri for the convenience of administration, putting officials in each division. These changes were practically carried out, and the clan system was entirely broken down, thus bringing about a centralization of political powers according to the Chinese pattern. The following is but a summary of the vast Reformation:

(A) Public land and people (citizens). (1) The people had, hitherto, belonged to the powerful gens and families and had been kept in the poorest condition not far removed from serfdom, while the land had been the private estates of the gens, and wealth had been almost entirely accumulated by them alone. In this reformation the land was all confiscated by the Central Government, and the people became direct subjects or citizens of the Emperor; so was the clan system destroyed. (2) The public land was distributed to citizens evenly. The census was taken first and all the names of the people were registered and every male over the age of five was given two "tans", or a little less than half an acre, of land, while a woman was given two-thirds of this. This land was returned to the Government when the holder died. The registration was renewed every sixth year. (3) Three taxes were newly imposed: one was on the land, being two bundles of rice on each "tan", the second was a requisition of labour, or else twelve feet of cloth or about two-and-a-half bushels of rice instead, from each house, and the third was a certain proportion of the special products of the locality.

(B) Centralization of government. The reformation of Taika was specially concerned also with the centralization of government and putting down the local divisions of the clan system. To accomplish this aim, a central government had to be established on a very strong basis. In 649, the Emperor ordered the establishment of the Central Government which consisted of eight departments modelled on the Tang government. In the country district the old officials were replaced by new state and country governors, horse stations were established for the convenience of travel and traffic, barrier-gates were set up in important places, and defensive preparations were made in the remotest districts.

(C) Appointment of men of ability. The third merit of the Reformation was in the appointment of able men among the people at large to important positions. Under the

Digitized by Google

old clan system even the officials were hereditary and this gave birth to various political abuses. This hereditary officialdom was entirely done away with by the Taika Reformation, and any one who had real talent might become a high official, no matter to which or to what kind of clan or house he belonged.

Prince Naka-Ohyé, who headed the council of this great revolutionary improvement, declared "As there are not two suns in the sky so there cannot be two kings over a nation, and the Emperor must be the only one who governs over and controls his people under heaven," and he set the first example to the people by handing over his own estates and subjects to the Mikado, thereby speeding the Reformation.

A Premature Trial Public and official intercourse with continental governments greatly enlightened the Japanese mind, and the Taika Reformation was the result of idealistic longings of the time for a complete structure of government. As a matter of fact the Imperial Government had never been solidly established before the Reformation.

The study of the Sui and Tang Dynasties and political and diplomatic relations with the continental countries stimulated from outside the need of forming a government worth while in the eyes of neighbouring states, while at home political and social affairs urged the high officials and princes of the Court to take drastic means to consolidate the Central Government, taking advantage of the general trend of the cultured class of people for an imitation of all things Chinese.

It was not, therefore, a natural reformation of a government already well organized, but rather the commencement of a real central government, influenced by the international spirit of the Chinese Government at that time. Unity and centralization of administration was completely exemplified by their big neighbour, and the young minds of the Japanese officials and nobles, entirely caught by its brilliancy, were too impatient to make fuller investigations on the adaptability of Chinese institutions to Japan and the Japanese of the day. The Taika Reformation, therefore, was hardly a success so far as its economic system was concerned and the formal institutions mentioned in (A) soon began to collapse.

Its Lasting Merit But the fundamental and imperishable meaning of the Taika Reformation is that it was the first systematic organization of the central government and the establishment of the spirit of national unity.

It was in this age that the whole nation of Japan was united into one. The Ezo tribes in Hokkaido Island and the inhabitants of the southern islands came to pay homage to the Central Government, and Buddhism was propagated among the northern islanders and the Kyushu tribes in the south as a cultural enterprise of the Government.

Taiho Law After half a century, or in 701, the Taiho Law was promulgated which completed the work of the Taika Reformation, especially in the organization of the Government. The construction of the Daijokan (the Great Government) was regulated in the Taiho Law and this form of central government continued till the Meiji Restoration, when it was revived in power and called Dajokan. The Government consisted of the Daijo Daijin, the Sa (left) Daijin, the U (right) Daijin, four Dai Nagon, three Sho Nagon, four secretaries, ten scribes, three Sa-benkan, and three U-benkan.

The Daijo Daijin was the tutor and personal councillor to the Emperor, and had no fixed office. In view of

Digitized by Google

the importance of the position it was not filled when there was found no suitable man. The Sa Daijin was the prime minister and controlled all the administrative offices and might over-rule the decisions of the Danjodai (a kind of court of administrative litigation).

The U Daijin took the work of the Sa Daijin in his absence and his responsibility was the same as that of the Sa Daijin. The Dai Nagon acted as counsellor in national affairs with the three Daijin just mentioned and assisted them, directly reported all the political affairs of importance to the Emperor, handed Imperial orders to the departments, and executed the offices of Imperial attendants. The Sho Nagon administered affairs of minor importance, the Secretaries and Scribes administered the business concerning public documents and Imperial edicts, etc. The Sa (left) Benkan administered the following four departments: the central, the ritual, the administrative, and the civil. The U (right) Benkan administered the other four departments: the military, the judicial, the treasury and the Imperial House. That is to say, the practical administration of the eight departments were executed by the Left and Right Benkan in accordance with the decisions and directions of the three Daijin and four Dai Nagon.

Learning and Religion A century around the Taika Reformation was the period when the Government was busy also in the study of Chinese literature, importation of the continental culture, and compilation and promulgation of new laws. It was an age of laying foundations for the future progress of the Japanese civilization. This study of continental cultures did not stop with that of China, but ancient nations west of China became tutors of the Japanese. Among the treasures which were accumulated by the Emperor Shomu (724-749 A.D.) and kept in the Sho-so-in Museum at Nara, there are many art products of Rome and Persia. The area represented by the treasures practically covers all the civilized countries of the Orient and a large portion of the Western world.

Systematic education of the young began with the building of Horyuji temple (see Chapter XXVIII). With the compilation of the Nihonshoki and Kojiki, Shintoism was formulated as the national religion. As to the nature of Shintoism and its philosophical analysis as a dogma opinions are divided, it nevertheless developed in this age from mere nature-worship to ancestor-worship, cosmogony and anthropomorphism, including a germ of the idea of a central deity of the cosmos in the belief in Amé-no-minaka-nushi-no-kami. On the other hand Buddhism was eagerly taken into the lives of the upper class people who had power to assimilate it.

Nara Age
(710–793)

Golden Age of Buddhism After the Taika Reformation in 646, the Government rather avoided the trouble of intercourse with the Korean Peninsula and concentrated their power on the better administration of home affairs, encouraging intercourse with China in order to bring the Chinese civilization more into Japanese life, and 60 years later founded the City of Nara as the capital, in Chinese style. For 70 years following its founding, it was an age of imitating Chinese things. Buddhism won the faith of all classes of the people and developed and expanded among them by leaps and bounds. This was the golden age for Buddhist fine arts, existing specimens of which make today the international

Digitized by Google

treasures of old Buddhism. The nation was prosperous and the people enjoyed a happy life such as they had not known before.

Throughout most of the 8th century Nara was the Imperial capital and towards the end of it Japanese civilization began to assume its own form and characteristics favoured by the peaceful social conditions. The Japanese poetry, waka, took a definite style and the range of subjects handled in the poems came to include all phases of life and nature as we see in the Mannyoshu collection of waka of this period.

The use of abbreviated forms of Chinese characters began in this period for the convenience of copying books in an age without much printing, although block-printing was introduced from China by 770 A.D., and prepared a way to the invention of Kana characters in the following Heian Age.

Division of the Rich and the Poor

As mentioned above, the economic plan of the Taika Reformation soon began to collapse. It was not, however, a return to the old patriarchal system but an advance to feudalism.

The even distribution of land under the Taika Reformation proved in practice insufficient and many farmers were compelled to obtain more land by cultivation of waste areas or to fall into heavy debt. On the other hand the nobles or former patriarchs of larger clans, the Court officials and priests began to accumulate special prize lands, gift lands and subject tenants. Many of the common people were reduced to the position of serfs, although in Japan there has never been such an inhuman system of slavery as existed formerly in Western countries, and people of the upper class became landed proprietors with wide estates which were called "Soen".

For the cultivation of new arable land, labour and the digging of water courses were required, so such land naturally came into the hands of the wealthy people. Besides the addition of newly cultivated land they enlarged their estate by purchasing the land of the poorer people, confiscating mortgaged land and conquering weaker landowners by force. This tendency in the rural districts went its course unchecked, while the Central Government was occupied with political and diplomatic affairs mostly concerning matters in the capital cities of Nara and Heian (Kyoto), and Court nobles gave themselves up to luxurious living.

Korea, China and Japan.
(660 B.C.–1019 A.D.)

From the time when these islands were first populated the Korean Peninsula had intimate relations with the islanders. Especially was this the case with the south-eastern part and the Izumo district, according to traditions. At the time of Sujin the southern part of Korea became a Japanese protectorate, but its eastern neighbour, Silla, scorned Japan and was subdued by Empress Jingo in 200 A. D. The western half and lands in the north also came under the influence of Japan and the whole peninsula became tributary to her. These small kingdoms mostly acknowledged the Japanese authority, but sometimes they rose in rebellion and Japan frequently had to send armies to the peninsula, till finally the Governor's office was destroyed by Silla in 562. Silla soon became the master of the whole peninsula, conquering the other small states, and entered into good terms with the Chinese Government. The ruling power of Silla was usurped by another dynasty in the 9th century. Japan did not forget to interfere in their affairs when suitable chance offered, but all her attempts

Digitized by Google

were in vain and she had lost her last trace of influence by the year 936.

The northern part of Korea had once been a territory of China in the second century B.C. Intercourse between the Japanese and Chinese people had already started in those days, and during the years in which the Korean peninsula was tributary to Japan the trade and travel between the two nations became greater and more frequent; many Chinese scholars and artists became naturalized in Japan and worked for the Government in the fields of literature, art and general technique. Some Emperors sent delegates to south-eastern China to get teachers of weaving and sewing.

In 607, when Shotoku Taishi was regent, an ambassador was sent to the Sui Dynasty and friendly official intercourse was opened. Later, when the Tang Dynasty replaced the Sui, diplomatic relations were still unbroken between the two nations and many young men and monks went to China for study. The culture and civilization of the continent flowed into Japan and greatly influenced her politics and social life. In the Era of the Emperor Tenchi, this intercourse was once checked by difficulties with Korea, but the Tang Emperor sent his delegates again to Japan to re-establish friendly relations, and they were accordingly restored. During the Nara Age, especially, travel was most frequent between the two countries, and science, religion, the fine arts, architecture and forms of living were all taken from China, such imitation continuing till the beginning of the Heian Age. Chinese civil wars proved a hindrance to these friendly relations and the Emperor Uda stopped the sending of delegates in 894.

In Manchuria a strong nation appeared in 713 and invaded northern Korea, and started some trade with Japan. Another arose later which came down even to the central part of the peninsula. Still another dynasty then gained control over much of eastern Asia and tried to invade the islands, but was defeated by the Japanese army in 1019.

Heian Age
(794–1192)

Fujiwara Despotism The Emperor Kammu changed the capital from Nara to the new city of Heian, i. e. the present Kyoto, in 794, and instituted a new era. For several decades after that the Imperial sceptre retained its power. But from the middle of the 9th century, the house of Fujiwara became closely related to the Imperial House, and began to assume regentship of the country. Taking all political power from the Imperial House, they gradually concentrated it in their own hands and planned only for the benefit of their family and relatives. Their despotism reached its climax with Michinaga Fujiwara in the 10th century.

In those days the Fujiwara family gave themselves over to luxury, and greatly influenced the city life of Kyoto making it indolent and vicious. But on the other hand literature and the fine arts made special progress. As the result of the cessation of sending delegates to China they turned their faces to Japanese habits and inherited ideas, and began to take on a Japanese flavour and style which was most graceful. Buddhism now assumed a strong and influential position not only among the people at large but also in the Court. The Enryaku Temple of Kyoto and the Kofuku Temple of Nara especially played a great part in this new tendency. It was noticeable that by this time the imported religion was largely transformed and Japanized in character.

Rise of Samurai Class Another remarkable phenomenon of this age was the rise of the samurai, the warrior class. The direct rule of the Emperor, in consequence of the weakening centralization of administrative power, was declining. In the local districts, the private lands owned by the aristocratic families were increasing year by year, and the orders issued by the Central Government were disregarded in those private territories. Local affairs fell into confusion, and robbers stalked abroad in the towns and villages. Wealthy landowners in the villages hired and fed soldiers for self-defence, and these farmer-soldiers finally became samurai, men whose profession was fighting. Sons of aristocratic families who could not get official positions also became soldiers with the farmers and strove after power. Soon they became really powerful, being specially rampant in the farther districts and even rebelled against the local order. But the bodyguard of the Court, hopelessly impotent, was useless for real battle, and the samurai rebellions were suppressed only by other samurai bodies. The princes and nobles also hired samurai to guard themselves and to further their political feuds. Warriors were encouraged to become ever more skilful in the practice of arms. It was quite natural that such a course of affairs gradually gave important positions to the samurai class in the Governmental offices. Among them the most famous ones were of the Minamoto (Genji) and Taira (Heishi or Heiké) families.

In the middle of the 11th century, the Emperors wished to restore the Imperial power and suppress the Fujiwara despotism. Finally in 1156 the Fujiwara power was completely broken and overthrown by the Genji and Heishi warriors, who were much honoured in consequence by the Imperial House. Before long, however, these two samurai houses became rivals and in 1159 Kiyomori Taira (Heishi) won the day against Yoshitomo Minamoto (Genji). Kiyomori had rare ability and great ambition, and forgetting that he was but a samurai followed the examples of Fujiwara and became himself another despot. For his wilful behaviour he was hated by all classes of the people, and Yoritomo Minamoto, son of the defeated Yoshitomo, rose on the tide of general bad feeling against the Tairas, and the whole Taira family were defeated and drowned at the battle of Dan-no-ura in the Inland Sea in 1185. It was Yoritomo Minamoto who first established the Government by the Samurai class.

Literature At the end of the Nara Age an abbreviated form of Chinese characters began to be used among scribes. In this Heian Age the Katakana, a Japanese syllabary of simple 'square' characters was derived from the Chinese ideograms, and lastly Hira-kana, a smoother and more fanciful style of Kana was invented and came to be used first among educated ladies and then by gentlemen also. Chinese sentences had monopolized the literature of former ages, but from the first quarter of this period pure Japanese sentences in Japanese alphabet appeared in a good volume and gave impetus to the rapid spread of Waka composition and beautiful Japanese stories like the Taketori-monogatari and Isé-monogatari.

The culture of this age had not yet reached the rural districts and common people, but existed only in the larger cities and a number of towns and among the aristocratic class. The 'kulturträger', the bearers of civilization and culture of the age, were court nobles, government

Digitized by Google

officials, priests and monks, and their families. It may be going too far to say that Heian was the only city of the Empire in those days, for there are evidences of the existence of some local market towns and trade ports. It is nevertheless true that there was a great difference in grade of civilization between the capital and the rural districts. The intelligentsia in the capital kept political power and literary heritage to themselves and their successors, their living being supported by the contributions and tenant fees from their estates at country places. They lived a luxurious and easy monotonous life as is shown in the Genji-monogatari by Murasaki-shikibu, a woman novelist. But at the same time Japanese literature made wonderful progress in this age.

Education School education was undertaken by the Government along definite lines in the city and local districts. In the city of Heian there was a Dai-gaku, (school of higher learning), which took in 400 boys of higher officials. There were 143 higher officials and 850 lower officials in the city. In the districts there were established Koku-gaku, provincial schools, open mainly for the boys of local officials. At Dazai-fu in Kyushu the Gakugyo-in, or institute of learning, was established for the provinces of the northern half of the Island. The main course of study in these schools was related to national politics based on the teachings of Confucius. But literature, music, physical science, pharmacology, astronomy, mathematics and penmanship were not neglected. Some of the local schools were superior and sent out able scholars. Children of the princes and court nobles were taught by private tutors. School education especially flourished in the Enryaku, Konin and Showa eras, under the Emperors Kammu, Saga and Nimmyo respectively. The building of the new capital of Heian gave rise to a new spirit of enterprise among the people and broader humanistic ideals began to show themselves, with sincere aspirations for the advancement of national civilization. Many young students went abroad. Prince Shinnyo, a young monk of the Shochoji temple in Izumi province, went to the Tang capital, and started from Rusha to Raetsu, near Singapore, for the study of Buddhism, but died on the way. The needs of the time gave rise to many private schools. Some representative ones were the Busho-in of Seiko Sugawara, the Kangaku-in of Fuyutsugu Fujiwara, the Gakkan-in of Tachibana, the Shogaku-in of Yukihira Arihara, and the Kobun-in of Kiyomaro Waké. The Sugawara family especially produced a succession of first class scholars, and many able young men came in to the Bunsho-in. This study of foreign learning continued from the previous ages to the middle of the era when the Emperor Uda stopped the sending of delegates to China.

With the slackening interest in Chinese cultural studies early in the 10th century the Government schools were gradually reduced in numbers and influence, as the power of the Imperial Government dwindled and the Fujiwara connections came to monopolize all official positions, leaving outsiders without hope of preferment. The Daigaku-in in Heian was closed after the buildings (five blocks of classrooms and one storehouse) were burnt down in the fire of 1177. Learning became an hereditary privilege with the growth of reactionary reverence for established lineage. Buddhism also became much Japanized by the appearance of such monks as Saicho of the Tendai and Kobo Daishi of the Shingon Sect.

Digitized by Google

Economic Condition The cleavage between the common people and ruling classes became more marked and the clan or family ties weakened as the connection between demand and supply became more complicated. From this arose the necessity for exchanges and markets. Waka of the Mannyoshu suggest the existence of markets in Japan at such an early date. As a matter of fact there had been several markets opened in bygone times such as those of Tsubaki, Atokuwa and Eka. On the beach of Takahama in Hitachi and by the straits of Asakumi in Izumo province there were primitive markets opened for the people. These markets were first started in connection with Shinto festivals. In the Nara Age, there were the East and West Markets in the city of Nara, where trees were planted for giving shade, and from there pedlars travelled around as far as Echizen province.

In the 7th century A. D. silver and copper money was already in considerable circulation. In the 8th century copper money was cast by the Imperial Government, although it is not clear whether all the money in circulation before that was of Chinese origin or not. In the first year of the Wado Era, 708, silver and copper coins named Wado-kaiho were cast at the Imperial mint, and this coining of metals continued, ushering in the period of money instead of barter.

In the Heian Age public markets were opened in the East and the West of Heian city. The East Market consisted of 51 shops and the West Market of 33, and they continued till the time of the Gen-pei (Genji and Heishi) wars in the 12th century. The largest among the local markets were at Tsubaki, Tatsu, Asuka and Ausa in Yamato province, Shikama in Harima (near Himeji), Naniwa in Settsu and Kowaki in Omi. There were many trading ports, and of these Hakata, Muko and Naniwa (Osaka) were the most thriving in foreign trade, Hakata coming first, located as it was at the northern end of Kyushu, nearest to Korea and China. Foreign commerce at this era was mostly governmental, private trading not being allowed.

Kamakura Age
(1192–1337)

Samurai Government Samurai government continued for 685 years, from the time of Yoritomo Minamoto to the end of the Tokugawa Shogunate. During the feudal age the Minamoto, Ashikaga and Tokugawa families appeared successively as the heads of this Samurai government, holding all power, both political and military, in their hands. At the Imperial Court were the august officials, but its rulership was only nominal, and the real sovereign power was kept by the Shogunate.

In the middle of the Heian Age, the Fujiwaras grasped despotic authority in politics, and the rule of the Imperial Court degraded into formalism. Imperial officials and nobles indulged in an effeminate life, discarding militarism. As stated above, vicious customs prevailed, misunderstandings arose between the Central Government and district offices and the gap between the rich and the poor became greater, gangs of robbers terrorized the people, civil wars great and small constantly occurred, and the people could not live in peace. This state of things gave opportunity for the rise of the warrior class, and the military government under the leadership of Yoritomo Minamoto was welcomed by the people as suitable for the troublous times, and the Shogunate came into being on its own merits.

The Kamakura Shogunate Yoritomo

Digitized by Google

adopted Oyé's counsel, and asking the permission of Goshirakawa, the ex-Emperor who had the real power at the Court, stationed his warriors in different parts of the country as governors and deputies. He gave these governors military and police authority and to the deputies he assigned the administration of land and tax affairs, in 1185. All the political power fell into Yoritomo's hands as a natural consequence, and the military and political offices which were established at Kamakura became Shogunate head offices; in 1192, he was asked by the Kyoto Government to become Seii-tai-Shogun, or Generalissimo, and this meant the public recognition of the Shogunate authority.

Yoritomo's lineal descendants did not continue to hold the power beyond the third generation, but the nearly-related Hojo family took their place and ruled the people with ability till Takatoki Hojo was overthrown by faithful adherents of the Emperor Godaigo in 1333. The Kamakura Shogunate was the real Central Government of Japan for over 140 years.

After becoming Shogun by Imperial Order, Yoritomo Minamoto took great care to control the warrior-lords. He himself lived a very simple life and issued orders to the lords and warriors to do the same, thereby setting good examples to the people. His teachings did not primarily stress skill in fighting or the use of weapons but rather the moral precepts which must underly the true warrior's way. The hitherto neglected and disorderly rural districts were taken care of and became closely united with the Kamakura Government, their agricultural and commercial life was improved, and the heavy taxation formerly levied by extravagant nobles was reduced to make the peasants' lives practical examples. He encouraged the propagation of the Zen teachings which emphasized an ascetic life, and those of the Jodo Sect which taught man to realize his sinfulness. The principles of Bushido, however, had mainly to do with the lord-and-subject relation among the samurai, and had defects as a common morality for the masses. But it is noticeable easier.

Foundation of Bushido Yoritomo was a pious man, revered both Shintoism and Buddhism, and was loyal to the Emperor. Bushido was indeed established by his teachings and here that the polygamy among the nobles of former days was gradually discarded and monogamy began to gain ground in this age, probably in consequence of the recognition of personality and the unusual emphasis on the fidelity of a lady to her lord in the Bushido code. Ideas of honour became strong; loyalty to the Emperor, patriotism, and belief in Japan as being the country specially favoured of the Gods became established national ideals; Buddhism was completely Japanized; and the general moral standard was considerably raised.

Education Education progressed also in the sense that it spread to local districts and especially among the samurai class. The Terakoya (see Chapter XXVIII) schools were started in the Buddhist temples of this age. Text books suitable for the education of samurai boys were compiled. At the time of the Ashikagas famous centres of learning were established at Ashikaga and Kanazawa (see Chapter XXVIII) near the present Tokyo. The Ashikaga Gakko (Ashikaga School) was first established by Yoshikané Ashikaga, a cousin of Yoritomo Minamoto, and has been continued for seven hundred years up to the present day. The Kanazawa Bunko (Kanazawa Libra-

Digitized by Google

ry) was first established in 1275 by Sanetoki Hojo, great-grandson of Tokimasa Hojo the Shogun. Women's education was not neglected and sewing, housekeeping, penmanship and reading and composition of prose and poetry were taught to the daughters of well-to-do people.

Art and Literature The rise of individualism gave a new turn to the cultural life of the people. The break of tradition was discernible in fine art and literature. This was the age of Sung and Yuan in China and their literature and arts, flooding Japan, laid the foundations of the modern literature and fine arts which developed after the Muromachi period. Picture rolls of famous battles and illustrated histories of shrines and temples were produced, reflecting the taste of the day. That portrait-painting first began during this age may be taken as a recognition of the individual value of men. (See Chapter XXXV.)

Commerce and Industry Before the Kamakura Age, agriculture was almost the sole industry of the people, although some things were produced in government factories. The spread of culture among the local population in this age, however, quickened the progress of commerce and industry in country places and local centres. Hand-work and carpentry were emancipated from the protection of the nobles and temples, primitive guilds were created and classes of artisans of armaments, porcelain, and lacquer-work, etc. came into existence. Seven guilds were established, of silk workers, charcoal burners, rice merchants, furniture makers, miscellaneous industrials, paper manufacturers and makers of ornamental things and cattle dealers.

Joyei Judicial Code In the first year of Joyei, 1232, a judicial code was issued. It was called Joyei Shikimoku (Joyei Judicial Code) compiled by Yasutoki Hojo and his colleagues. This was a compilation founded on the judicial customs of olden days and had no incongruities with the Japanese common life as was often the case with the laws issued by the Central Government at Heian, largely imitations as they were of Chinese laws. It proved, as a matter of fact, to be more practical and effective, and survived many other laws, as an authoritative code for the samurai class, to the time of the Meiji Restoration.

Muromachi Age
(1338–1602)

The Muromachi Shogunate Shortly after the downfall of the Kamakura Government, Takauji Ashikaga established a Shogunate in Kyoto, wholly on his own accord, in 1338, and in the time of his grandson Yoshimitsu his work was completed. It was called the Muromachi Shogunate after the name of the street in Kyoto in which the government had its headquarters. Its system and institutions were almost the same as those of the former Kamakura Government. A relative of Ashikaga governed eastern Japan, staying at Kamakura. This Kamakura governor was first a simple representative of the Muromachi Shogunate, but by and by he began to stand in rivalry against it. Governors were sent to other places and generals were placed at the head of different military bodies. The governors in local districts were real lords, and acted freely on their own caprices.

Korea, China and Japan

The public exchange of delegates with foreign countries was, as we have said, abolished, but private trade continued nevertheless. The Sung Dynasty united China in 979, and called forth a thriving inter-

Digitized by Google

national commerce. Merchants and Buddhist monks made visits to China much oftener than before. Kiyomori Taira opened a port at Hyogo and interviewed Chinese merchants at his palace. In the Kamakura Age, the Buddhist Zen sect was introduced from China, and the Hojo built huge temples for its monks.

The Yuan Invasion In 1206 the Yuan Dynasty gained sovereignty over the greater part of China and extended its territory even to a part of Europe. The great Emperor Kublai Khan took Korea, and destroyed the Sung Dynasty, winning possession of all China in 1279. He sent a messenger with advice to Japan to become his tributary, under threat of war. But Tokimuné Hojo, then in power at the Kamakura Shogunate, uniting forces with the Kyoto Court, firmly rejected the proposal. The result was a crisis for Japan in 1274 and again in 1281. The Yuan ruler in alliance with the government of Korea sent a great army to invade Japan. The Japanese were hard pressed, but they fought bravely with their small forces, and by the help of a typhoon which destroyed the enemy fleet they won the day in the summer of the year 1281.

The trade between the two nations, however, did not cease with the war. Takauji Ashikaga wished to build the Tenryuji temple and to get funds for the purpose he constructed trade boats which were called Tenryuji boats.

Trade with the Mings From the beginning of the Kamakura Age, Japanese pirates had plundered the coasts of China and Korea. In the Muromachi Age, the Shogun Yoshimitsu Ashikaga concluded a friendly treaty with the Emperor of Ming in 1401. At the time of Yoshinori delegates of the Shogunate went to Ningpo with passports given by Ming authorities and traded there with the Chinese merchants. Not only Government delegates, but also the governors of local districts, monks and priests of temples or shrines, and some merchants of Hyogo and other ports sailed in and out with a similar purpose. The trade with Ming brought a great profit to Japan, and the Shogunate was relieved of its economic hardships, the western ports throve and the people became wealthy. The Shogunate did its best to prohibit the ravages of pirates, to prove their friendliness to the Ming Dynasty, but at the end of the Muromachi Age when the Shogunate lost its power and the local lords did as they liked, Japanese pirates again pillaged Chinese coasts, which were for a long time troubled with them.

Relations with Korea At the time of the rise of the Mongolian nation, Korea turned against Japan under pressure of the Mongols. But the Japanese pirates ravaged unbearably along her coasts, and she asked the help of China to send a strong protest to the Japanese Government. A general of Korea, Li-Seikei, was successful in protecting the nation from the attacks of the Japanese pirates, and he finally established a new dynasty of his own and called the new country Chosen in 1392.

Among the provincial lords there were many who had intercourse with Korea. Tsushima Island, especially, had close relations with her because of the nearness of its location. Its lord, So, opened trade with Korea in 1868. When Korea became known as Chosen these relations became even more intimate. There were many Tsushima islanders who became residents of Korea. (As to Japan's relations with the Western nations since 1543 when the Portuguese first came to Japan, see pp. 77-87 of the Japan Year Book, 1933,

Digitized by Google

and Chapter VI of this volume.)

Feudalism It was during this age that feudalism was established as a definite system, and many of the provinces were ruled over by warrior-lords. Warriors fought each other, farmers were awakened to the need of uniting to protect their interests, and temples quarrelled with one another over the delimitation of their spheres of influence. It was a "dark age" in one sense, but important as an age of social change and progress. The advance of foreign trade was remarkable, and Japanese emigrants settled down in the South Sea Islands.

The warrior-lords began to disregard the orders of the Shogunate, becoming selfish and money-loving. Yoshimitsu Ashikaga, the third of the line, reorganized the Shogunate and restored its power for a while, but after his death it began to decay and the local lords usurped its authority. Both in the capital of Heian and in the districts civil wars raged year after year. The luxurious living initiated by Yoshimitsu and Yoshimasa (the 8th Shogun), spread like an epidemic among the local lords and warriors, and the ones who suffered most from the poison were the common people, the farmers and merchants, because the expenses of the luxury of the upper classes came always from their pockets.

The latter half of the Muromachi Shogunate was an age of civil strife among the feudal lords. All tradition and authority disappeared, and any talented man, favoured by fate, had the chance to make himself a lord.

Military and General Education Progress in military arts and the use of weapons was a feature of the age. Various styles of Kendo (fencing) were founded and schools to teach the art flourished in the four corners of the Islands. Nor was general education neglected. Both the Ashikaga Gakko and Kanazawa Bunko fulfilled their functions as educational centres, Terakoya were established in more districts and education began to reach the farmers and merchants. In 1561 St. Francis Xavier landed at Kagoshima, at the southern end of Kyushu, and the Catholic faith was first preached among the Japanese. Otomo and other lords in Kyushu were baptized and within less than 30 years there were 200 churches built and over 1,500,000 people converted. Nobunaga Oda was in favour of Christianity from his policy of suppressing the unruly power of the Buddhist monks. Catholics were also eager to establish schools. Within the feud of Otomo there was established a seminary (Casa Professa) for training preachers. Colleges for young laymen were established at Arima in Higo province, Kyushu, Funai in Bungo province, Kyushu, and Azuchi in Omi province near Kyoto. The last one was opened in 1581, and 25 boys from good families were instructed in the catechism, Latin, Portuguese, Japanese reading and composition.

Woman's Position Here it must be mentioned that the status of women was greatly lowered in this age of war-lords and samurai. Men vaunted their physical prowess in battle, while women were compelled to live secluded lives, sheltering at home from the dangers of the times. Chinese dicta concerning the "three obediences and seven reasons for divorce" making of woman little better than a slave or chattel, suited the selfish convenience of man, and the Buddhist idea of woman as an impure being detrimental to man's ascent to Buddhahood, all worked together to pull woman's social position down to a ridiculously low level, contrasting with the high status she

Digitized by Google

had enjoyed in more ancient days.

Commerce Ravaged by frequent warfare, the city of Heian or Kyoto had become deserted, the population thronging to the villages which nestled around the castles of the feudal lords. These in time became thriving cities or towns. Among sea ports Hakata, Hyogo, Muro, and Sakai were representative ones. To Sakai, for instance, came the foreign ships direct, and there arose many wealthy merchants who had financial power over the Muromachi Shogunate. It was a free city, governed by its own city assembly and protecting itself by the city guard. Yukinaga Konishi who was first a pharmacist and became a lord on his own account, Sen-no-Rikyu, the famous specialist in the tea ceremony, and Sukéémon Noya, a millionaire merchant in foreign trade with the South Sea Islands, were representative men of Sakai.

Industry The taste of the age was rather simple and purely Japanese. The warrior-lords found recreation in the tea ceremony or garden-making. The preservation of natural simplicity was the dominant note in these gardens, rocks and pebbles being used in their construction. The national leader in this direction was Yoshimasa Ashikaga, the Shogun, who originated the tea ceremony. This ceremony was never a mere drinking of tea but a formalized social meeting, at which guests were invited by the host to a simple and tasteful dinner which was called Kaiseki. Choice porcelain wares and other utensils were used in it and the guests were entertained not only by the repast but also by the exhibition of rare articles and scroll pictures. It became a fashion of the time and greatly stimulated and improved the art of making porcelain, lacquer and cast-iron wares and Kakémono paintings. These were exported to the continent for the first time in the history of Japan.

The last quarter of this age, however, called the Momoyama Period in art history, was represented by the gorgeous taste of Hideyoshi Toyotomi who built the Momoyama Palace of silver and gold. The influence of the Western world definitely reached Japan with the coming of Catholic priests in this period. It affected not only the spiritual and mental life of the Japanese but also the field of architecture, etc. When Nobunaga Oda built the Azuchi Castle, the first of its kind, in 1576, Catholic priests gave advice or directed the construction. The central building of the Japanese castle is called Tenshu-kaku. The word Tenshu means the Heavenly Lord or God of the Catholic Church, and the Tenshu-kaku signifies the Tower of the Heavenly Lord. It is said that in the Tower of the Heavenly Lord Catholic images were enshrined when it was first built. According to an art investigation, there are in Italy remnants of old buildings which resemble the Japanese castles and the influence of the Roman architecture through the Portuguese and Spaniards must have been felt in the Japanese castle building.

Economical Conditions There were economic reasons underlying the civil wars among the feudal lords in the latter half of the Muromachi Age. Enlarged volume of production, progress of communication and transportation, advancement of commerce and industry and changes in military strategy following the introduction of guns led to the wars of territorial invasion and expansion among the lords who had to provide for an increasing number of soldiers and officials. Both commerce and industry had progressed slowly but steadily with the spread of civilization to local centres since

Digitized by Google

the time of Yoritomo Minamoto. Natural economy evolved to that of commodity. Merchants and artisans were gaining standing as a class. Up to the middle of the Muromachi Age the guilds called "Za" monopolized the supply of goods to the lords; this system, however, came to an end with the progress of free trading, and public markets were permanently established. The appearance of large towns and cities necessitated the accumulation of commodities and provisions from adjacent country places and other parts of the land and hastened the growth of wholesale dealers. The wholesale dealers of the age were called "Mommaru" and combined the businesses of innkeeping, wholesale trading, transportation and money exchange at the same time. Banking business also made considerable progress. There were no banks in the modern sense, but the pawnshops were the banks of the day when as yet there was no regular credit system. Buddhist temples and the brewers of saké acted also as money lenders and they together with the pawnshops were usurers and capitalists. Tanomoshi-ko (small associations for mutual financial aid) were already in vogue. Accumulation of wealth became a dire necessity for the lords, but they had to rely wholly upon the farmers and merchants for financial support while the Central Government was too weak to aid them or protect their interests in accordance with the change of social and economic conditions. Some fell so heavily into debt that finally they had to surrender their territory to their creditors. The Shogunate prohibited the purchase or mortgage of land owned by the samurai to merchants and land proprietors, but this regulation was not observed. By the end of the Kamakura Shogunate it had become too late to attempt the financial rescue of the samurai. The lords levied heavy taxes on their people and farmed out their collection to appointed merchants. The final outcome of this system, however, was to let the land fall into the hands of those agents, so that the lords were driven in desperation to get new land by force. At times the farmers and smaller merchants resorted to violence to protect their rights and demand more merciful governance from their respective lords or the Shogunate. They often attacked the wealthy merchants, temples and pawnshops to get back goods they had pawned.

The latter half of the Muromachi Age witnessed the phenomenon of Buddhist mob rioting and fighting. The Shin Sect (or Ikko Shu) founded by Shinran gained great numbers of followers among the common people, and some uprisings of these religionists were in reality directed against the ruling class. For instance, the Ikko mob which started rioting in the districts of Kaga, Noto and Echigo provinces, fought against Masachika Togashi the lord of Kaga and killed him, while another in the district near the present-day Kobé and Osaka defeated the armies of Hosokawa their lord, the fight extending over several provinces from Sakai to Ishiyama in Omi province. Iyéyasu Tokugawa, then lord of Mikawa, fought with them in 1563, and to Nobunaga Oda also they were a constant source of trouble.

The social changes caused by the progress of trade and commerce during the Kamakura and Muromachi Ages and the consequent disorder among the ruling classes were not allowed to take their own course very long, for foreign relations, especially with Western countries, presented many international problems and the necessity of national unity

Digitized by Google

became keenly felt. As already mentioned, the introduction of firearms brought about a fundamental change in methods of fighting. Arrows were no match for bullets. Preparations for war had to be made on a much larger scale and the warriors or soldiers reorganized in a more systematic way, and consequently the smaller lords were forced to unite under the leadership of greater ones who possessed real power and means to organize new armies. And thus the unity of all Japan was realized through three stages under three great war-lords, Nobunaga Oda, Hideyoshi Toyotomi and Iyéyasu Tokugawa.

Nobunaga Oda The first, Nobunaga Oda, was an official under the lord Shiba, but soon becoming independent he subdued many lesser lords one after another with his soldiers armed with guns, and, in July, 1573, dethroned Yoshiaki Ashikaga the Shogun and demanded direct access to the Emperor Ogimachi. Nobunaga who had had long and bitter experience of the Buddhist mobs waged war against them and set fire to the Enryakuji temple in Mount Hiei, one of the most powerful temples of the time, thus putting an end to Buddhist meddling in political affairs. He found another means of lessening the power of Buddhist temples by favouring the spread of the Christian faith. He gave all encouragement to its propagation and welcomed the inflow of Western learning and civilization. Nobunaga destroyed the barrier gates in districts which hindered free commercial intercourse and transportation and put an end to the monopolizing guilds and gave merchants opportunity for unrestricted trading. But in 1582 he was assassinated with his work yet incomplete, and it was left to Hideyoshi to continue the task of uniting the nation.

Hideyoshi Toyotomi Hideyoshi Toyotomi, a farmer's son, and one of the trusted generals of Oda, succeeded in subduing even such great lords as Mori and Shimazu in the west and Daté and Hojo in the north and practically united the whole nation by force. In 1583 the whole land of Japan was surveyed to divide it into new rural districts. In 1586 Hideyoshi fixed the costumes of the samurai according to their rank. In 1588 the common people were ordered to surrender their swords for casting a Daibutsu (great image of Buddha), the purpose of this order being to prevent the wearing of swords by any except the samurai. The law of 1591 strictly prohibited the shifting of hereditary business, and the four classes of samurai, farmers, artisans and merchants were firmly fixed.

To force obedience to the law Gonin-gumi (Five Men's Bands) were compulsorily organized. All the people (samurai inclusive) were grouped by 5 or 10 families and each group not only took joint responsibility for the doings of all of its members but helped its members in civil life. This originated before Toyotomi's time, but the law issued in 1600 made it an established institution and played an important part in the following Tokugawa Age both politically and socially. Hideyoshi planned an invasion of the Continent, Formosa, and the Philippines, but died in 1598 before realizing his dreams.

Before the absolute unity of Japan could be accomplished another great statesman was to take the work in hand.

Yedo Age
(1602–1867)

In 1600 Iyéyasu Tokugawa gained a decisive victory at Sekigahara, near Nagoya, over his opponents and became the practical ruler of Japan.

Digitized by Google

Except for a small portion allotted to the Imperial House and various religious bodies over 90 per cent. of the entire land was divided among the Tokugawas, their relatives, and favourite generals and lords. Thus the complete unity of the nation was realized by the dual master-and-subject relation between the lords and their people and then the Shogun and the lords. This feudal system endured over 260 years, being quite unparalleled in the history of the world. This was a success primarily for the Tokugawa Shogunate rather than the nation. It was due for one thing to the financial and military strength of the Tokugawa family, secondly to the clever method of administration best suited to keep wayward war-lords in order, and thirdly to the halting of alien influences from overseas.

Iyéyasu located the seat of the Central Government at Yedo (Tokyo) and governed from there his 200 lords and generals. The financial basis of the Shogunate was superior. About 7,000,000 koku ("koku" in this case means the area of land which can produce one koku of rice) or nearly one-fourth of the national area of 30,560,000 koku, was owned by the Shogunate directly or indirectly. Besides, all the ports and places important for political and military purposes, the largest cities and the centres of industrial and commercial activities, and all the mines of any value were under the Shogunate's direct control. It also retained the right of casting coins.

Buké Hatto (Samurai Law) After giving the final blow to the Toyotomis in May, 1615, Iyéyasu Tokugawa ordered the drafting of the law concerning the daimyo (feudal lords) and samurai. In July of the same year the Samurai Law was pronounced before the gathering of the daimyo called for the purpose by the Second Tokugawa Shogun Hidetada. It consisted of 13 articles the gist of them being as follows: (1) Samurai must be well educated in general learning and versed in the arts of war; (2) Unbridled drinking and luxuriousness are strictly prohibited; (3) Criminals must not be aided or concealed; (4) All treasonous bodies and murderers should be banished; (5) No person other than the subjects of the daimyo should be allowed to live in his territory; (6) All repairs to castles must be done only by permission of the Shogunate and the building of a new castle is strictly prohibited; (7) If anyone detects a new castle building or a secret political organization in a neighbouring province he must report it to the Shogunate; (8) Marriages must not be celebrated privately; (9) All the lords are required to observe "sankin-kotai". (According to this article the lords were divided into two groups, and each group was to come up to Yedo, the seat of the Shogunate, in April every other year, to stay there for one year and the Shogunate prepared their Yedo residences where their families were kept as hostages. These rules were somewhat loosened in later years.) (10) Styles of costume should be regulated according to rank and social position; (11) Servants ought not freely to use the palanquin (the only vehicle in those days) in travel; (12) Samurai should be instructed to live frugally; and (13) the lords should use discretion in appointment of officials. The purpose of this law was to restrict the armament of the lords, to suppress political organization and treason, to effectively inspect the local government of the lords, and to force them to keep order by strict rules on their behaviour. The number of the daimyo was 157 according to the Shogunate statistics of 1614.

Digitized by Google

Kugé Hatto (Court Nobles Law) This law for the court nobles was promulgated in July, 1615, in the assembly of 150 court nobles at the Nijo Castle, Kyoto. It consisted of 17 articles, and included regulations regarding the positions of the Emperor, Imperial Princes and Princes, the appointment of a Regency and chief councillor, adoption, court ranks, institution of the year name, costumes, the order of promotion, orders issued by magistrates, sentences of the court, and the position, ranks, costumes and honorary titles of the head priests of Buddhist temples. The main points of it follow: (1) It is humbly recommended to the Emperor that he should be a good scholar and well versed in all the arts; (2) Unless he is equipped with knowledge and ability no one ought to be appointed to be Regent, Chief Councillor, Daijo Daijin, Sa Daijin or U Daijin even from among the Sekké (Five highest nobles from whom the Regent was to be chosen); (3) As to the appointment of a monk to the head of the Monzeki (temples the head priests of which are princes or court nobles) or the Ingé (temples next in rank to Monzeki). Customary order should be strictly kept, and when a common man is appointed his rank should not come up to the first Sojo (highest position of the priest, the order being Sojo, Sozu and Risshi, each subdivided into first and second) even though he be endowed with rare ability; except for those who are, at the same time, tutors of the Emperor or daijin. (4) To be head priest of the Monzeki, a Hoin (the highest rank, with surname of Sojo) or Sozu is to be appointed; to that of the Ingé, Sozu or Risshi; a Hoin or Hogen (next in rank to Hoin) is to be appointed according to customary order; a common man should be first recommended by the temple itself and then pass through the examination of the committee; (5) The head priest of the purple garb temples (or the temples of the highest order: the order of the temple was indicated by the colour of the garb wore by the head priest such as purple, scarlet, light blue, yellow, light red) should be appointed also according to customary regulations, although of late these regulations have been disregarded by Imperial order and there are those who usurp the position. Hereafter, the ability and virtue of the candidate must be examined and he must be recommended by the committee in the Imperial Court. (6) The honorary title of Shonin should be given to the learned monks only by Imperial order. It is to be divided into first and second grades and the first grade should be given to monks who have had over 20 years' experience in the faith, and the second to younger ones; those who are ambitious for the title without fulfilling its requirements should be banished.

System of Control Iyéyasu took scrupulous care not to give any chance to the Imperial House and the greater lords to gather forces against the Shogunate. His first policy was to restrict their powers by the promulgation of the Kugé Hatto and Buké Hatto above mentioned. His second was to allot their districts to the respective lords by an administrative plan deliberately schemed out. The Kanto district in which the seat of the Shogunate was located was put under the direct rule of the Shogun and ruled by his personal generals to protect the Central Government from an attack. In the districts around Kyoto, the city of the Imperial House, none of the Tozama Daimyo, the conquered lords, were placed, but only the relatives of the Tokugawa and the Fudai Daimyo, lords who had been on the

Digitized by Google

Tokugawa's side from of old; and in Kyoto itself a representative office of the Shogunate had the responsibility of watching any political move in that city. Along the two main roads, the Tokaido and Nakasendo (or Koshukaido) which connected Kyoto and Yedo, the Fudai Daimyo only were appointed to rule over the districts. The Tozama Daimyo were all given lands in the remoter parts and between each two of them a Fudai Daimyo was placed to play the part of a barrier. Such important places as Osaka, Sakai, Fushimi, Nagasaki and Uji-Yamada were administered by the governors directly sent from Yedo. The children of Iyéyasu were given large feuds and established the Houses of Mito, Owari, Echizen and Kishu, forming a defensive semicircular line. As a whole, Iyéyasu cleverly divided the land among the lords so as to keep the balance between the East and the West, and this policy proved successful till the balance was broken when in the first half of the 19th century the western lords arose in rebellion. The Shogunate paid minute attention to all travellers along the Tokaido, and put a barrier at Hakoné, and no people were allowed to pass through the gate without a passport issued from the lords or the Shogunate. After the enforcement of the articles of the Buké Hatto requiring the family of a lord to stay at Yedo, women were almost entirely prohibited from leaving the city for they must get Hakoné passports directly from the Shogunate.

The purpose of the seclusion policy adopted by the Tokugawa Shogunate was to shut out any possible outside political influence and to prevent the local lords from getting large profits out of foreign trade, and rising thereby to financial and political power. The Shogunate did everything to safeguard their supremacy and to make the lords obedient as sheep, no matter how the national progress was hindered or into what miserable condition the people might be thrown.

Organization of the Tokugawa Shogunate The Shogunate was a government of one despotic ruler: the Shogun. No one man, however, can perform all the duties of a government unassisted. Although there were many changes in the organization and the names of offices in the 268 years of its rule the Yedo Government, in the main, had a Cabinet which consisted of one Tairo (the great elder), five Roju (the middle elders), and five Wakadoshiyori (the younger elders). The Tairo was the premier but, though the Shogun at times placed his most reliable and able statesman in the position, the years in which a Tairo held office were but few; for the rest the Shogun himself exercising its functions. The Roju were the ministers of the administration and signed the public ordinances and documents of the highest import. Their standard of administration was the former customs and the laws newly issued, and the secretaries had the responsibility of examining old customs and precedents to help the decisions of the Roju. These five saw to matters concerning the Imperial House, the court nobles and prince monks, and controlled all the lords and high officials, local governors and inspectors, and in wartime commanded the armies of the lords.

The Wakadoshiyori consisted of four or five members who were at once councillors and vice-ministers and controlled the Hatamoto (the generals who directly belonged to the Shogunate), and the lower officials, and in any emergency commanded the armies of the Hatamoto.

Both the Roju and the Wakadoshiyori were appointed from among the

Digitized by Google

Fudai-Daimyo only.

Under the cabinet there were three Bugyo, the Jisha Bugyo (Temple and Shrine Department), the Machi Bugyo (City Department), and the Kanjo Bugyo (Counting Department). The Jisha Bugyo controlled all the temples and shrines in the country and administered justice in the remoter districts. The Machi Bugyo administered the city (Yedo) affairs from administrative business to justice, police and prisons. The Kanjo Bugyo took charge of the treasury of the Shogunate gathering taxes from the estates directly belonging to the Shogun.

The Roju, the Wakadoshiyori and the three Bugyo formed the Central Shogunate Government, all other officials belonging to or coming under the control of one or other of these. Among the local officials the most important were the Shoshi-dai who represented the Shogunate at Kyoto, the Osakajo-dai who represented the Shogunate at Osaka, the Fushimi Bugyo, overseers of the barriers at Kyoto, the Kobusho Bugyo or military department, and the Nagasaki Bugyo who controlled the lords in Kyushu.

Cultural Life Culture and civilization made greatest progress in the western part of Japan and it was in Osaka and Kyoto that literature and a more refined life developed in the earlier years of the Yédo period. Iyéyasu was anxious to spread knowledge and encouraged the study of the Japanese and Chinese literatures of former days; scholars of great learning appeared who opened schools and published commentaries or interpretations either of their own accord or by the backing or order of the lords. The progress of the art of printing greatly helped the spread of education in books. But in the early days of the age most of the energy of the ruling class and the common people was spent in readjusting their political and social life to the new state of affairs created by the united and centralized government of the Tokugawa Shogunate, and time was needed for the psychological atmosphere of the people to settle down toward a peaceful enjoyment of life in this better-organized society.

It was not until after half a century that a characteristic taste and way of life began to show themselves, discarding the old garbs of traditions. Here it must be noted that the fundamental feature of the literature of the age was that it was the creation of the common people, who were robbed of all opportunity for rising to higher social position or assuming official posts in the government. The so-called Genroku period commenced with the luxurious life of the fifth Shogun Tsunayoshi who was a man of enthusiasm, fond of learning, and encouraged lectures and schools. Even before his time the general trend of the period had been toward extravagance and amusement following a century of peace. The Shogun's example, however, quickened and intensified this tendency, and such amusements as "no" drama, joruri (or gidayu), and kabuki (see Chapter XXXVII) were enjoyed by the general masses, while pure literature such as hai-ku, waka, novels, and stories began also to be written and read among the lower classes. Skill in the fine arts, characteristic Japanese hand-work and special weaving arts reached the highest pitch.

The originality of the Japanese made itself felt in almost all lines and aspects of learning and daily life. One instance of this was in the compilation of the Dai Nippon Shi (the Great Japanese History) under the auspices of Mitsukuni Tokugawa, which had been commenc-

Digitized by Google

ed in 1657. Mitsukuni of Mito who was a grandson of Iyéyasu and one of the greatest figures among the lords in the Tokugawa Age, called scholars to Mito for the encouragement of Japanese learning and ordered the production of the Dai Nippon Shi on principles purely Japanese, his spirit exercising a profound influence over the people. In the Genroku period literary men were able to publish their writings freely and the joruri of Chikamatsu, the novels of Saikaku, and the short poems of Basho had a great circulation, most of their works becoming literary treasures of Japan for ages to come.

The leadership in civilization was still with Osaka and Kyoto up to the end of this period. But the Sankin-kotai and the power of Yédo, the seat of the Shogunate, did not long allow the centre of culture and fashion to remain in these old western cities, and Yédo had finally assumed the first position in all matters of political and social life by the last quarter of the 18th century. The following 80 years, especially the first 50 years of it, was the golden age of the cultural life before the Meiji Restoration.

The educational programme of the Tokugawa Shogunate, begun with Iyéyasu himself and encouraged through former decades bore fruit in this period. There appeared many Japanese and Chinese scholars, and literature among the common people reached its prime.

The policy of the Tokugawa Shogunate in handling the people from the lowest up to the lords themselves, was very severe, and the class most oppressed was the common populace. Social tragedies amply reflect themselves in the literature of joruri writers, Chikamatsu and his contemporaries, and in spite of apparently good intentions of the Shogunate rulers and advisers to improve the political, economical and social conditions, in many cases the people in general were either trodden down under the feet of the lawless samurai or entangled and helpless in the network of the prohibitive laws.

But the characteristic optimism of the Japanese kept them from falling into hopeless discouragement and their surplus time and money were spent in amusements of all kinds. This repressed energy found its outlet in creative industry and literature, or their enjoyment. Besides the standard works of literature there are preserved smaller illustrated pamphlets, short novels and poems which reflect the life of the common people in those days. They expose the looseness of the social life in many respects, but it is wonderful how they show the innate heart of the Japanese people, optimistic, realistic and humane. If it were not for its partial suppression by the Government this common literature might have attained remarkable progress. All Japanese amusements either originated or took definite form in this age. In the upper classes of society a similar course of development ran through all the phases of life. Characteristic Japanese philosophy on human life or Shintoism was created by the combination of Chinese philosophies and Buddhism. Bushido was theorized and its morals were generally sound, and moral activity reached its zenith in the overwhelming loyalty movement at the end of the Yédo Age which culminated in the downfall of the Shogunate and the brilliant Meiji Restoration.

Gradual Economic Decline At the beginning of the Tokugawa Shogunate foreign trade was carried on to a considerable extent but afterwards it was almost entirely prohibited except to a small extent through one trade port, and all hope of increasing

Digitized by Google

the national wealth and economic progress of Japan was lost for the time being. Even with its income from the large territory above mentioned the Shogunate could hardly manage to keep pace with the ever increasing expenditure, and financial unsoundness appeared already at the time of the fourth Shogun, and from the fifth Shogun on they were forced to rely upon the profits gained by the recasting of coin. Various improvements and revisions of economic policy wrought no material change of situation for the better. In the Tempo Era (1830-1844), the Government stood on the brink of bankruptcy and during the last years of the Shogunate the financial situation went from bad to worse.

The local lords had territories of 10,000 koku to 1,020,000 koku each, but their income from these was too small to feed all their dependent samurai and soldiers, and to finance the Sankin-kotai travelling expenses. They fell into heavy debt, their creditors being the wealthy merchants and money lenders at Yédo and Osaka, the two business centres of the time. From the middle of the Yédo Age few of the lords could manage without the help of the rich merchants. Seventy per cent. of the national wealth was said to have gone into the hands of wealthy business men at the end of the age. In 1843 the lords sent about 4,000,000 koku of rice to Osaka, 3,000,000 koku of which went to the Osaka merchants as interest for their debt of 60,000,000 ryo (gold coin). All means to which they resorted to increase their incomes proved in vain.

The samurai were also compelled by the Sankin-kotai system to have two houses, one at their rural town and the other in Yédo. They were not allowed to do any productive work but received a kind of salary from their own lords, and mostly lived a leisurely life, although some were given offices in the local governments. The long peace did not necessarily bring happiness to the samurai, but rather drew them into different means of pastime and their fighting spirit was dulled with the increasing tendency for luxury. Their income was limited from the beginning and it was still more shortened by compulsory loans to their feudal lord out of their 'fuchi' or salary, or even complete suspension of its payment. They had no way of extorting from the farmers, as the lords had, and after losing all their means they could not help but break the law and work secretly for their living as artisans or small merchants. In the end the samurai began to sell their weapons and armour which had become useless in the long years of peace.

In the Yédo Age the country folk still lived on the natural products of their farms, helped out by some small income from their handwork, and each village constituted an economic unit, self-supplying and self-supporting. The political peace benefited farmers especially and increase of production resulted from the improvement of farming instruments and institutions. The kinds of vegetables grown became more numerous, sericulture advanced remarkably, and new areas of arable land were brought under cultivation. At the time of Toyotomi's land survey (1573) the rice production of the whole country had been estimated at 18,000,000 koku. In the Genroku Era (1688-1704) it increased to 25,780,000 koku, and, in 1842, to 30,550,000 koku. But 50% of the farmers' income had to be paid to the lords, they were forbidden to move from one place to another, or to change their occupation, purchase of land was restricted, the Goningumi and other feudal institutions

Digitized by Google

fettered them hand and foot. So this class of people was also thrown into miserable depression, and farmers resorted to such desperate measures as infanticide, fleeing to cities and mob riots to escape from their difficulties or fight for their living.

It was estimated that the proportion of farmers to the whole population was 80%, and the total population in the Yedo Age showed a slow increase in the first half and a standstill in the latter. This was brought about by such natural causes as famines, prevalence of epidemics and insanitary dwellings; but the dreadful habit of infanticide which originated from the direst difficulty of living among the farming-class, must have been the greatest factor in checking the increase of population, for it was usual among farmers to restrict the number of their children to less than three in a family. Another negative measure was to flee from the territory of the despotic lord to large cities. Cities had insufficient capacity to receive the inflow of these country people because as yet there were no industrial factories, but there were many openings for house-workers, day labourers and apprentices in the business houses or artisans' shops.

The number of recorded farmer-mob riots reached 568, including 68 in the early period of the age, 236 in the middle and 264 in the last. The usual motive for rising in mobs was anger at the unreasonable extortion by the lords, tenant disputes being as yet rare.

Commerce and Industry The advance of commerce was helped by the increase of population in the towns and cities where central and rural governmental seats were located and the regular journeys to and from Yédo of the lords and their soldiers in Sankin-kotai. But as all foreign trade was banned, business could not take on any natural or international development. The main commodity of the day was rice. The production of this in Kansai, Chugoku (the Main Island west of Kobé), Shikoku, Kyushu and Hokuriku (districts facing the Japan Sea in the central part of the Main Island) were transported to Osaka rice-dealers, while that of Kanto and Ohu or the north-eastern provinces was sold in Yédo. Exchange business in rice had already commenced among Osaka merchants and speculations began to draw common interest. Coins of gold, silver, bronze or copper were in good circulation by this time, although these suffered changes of value at times, and the west of Osaka adopted the silver standard while the east of same the gold standard. Paper money was issued by the rural governments so that money economy prevailed all over Japan. Bank business or Ryo-gaé and credit system made considerable progress.

Yedo had over a million population and Osaka came next with several hundred thousand. There were many other cities of over ten thousand. Seclusion had put a stop to sea transportation to foreign lands, but land transportation within the country made wonderful progress. The five highways, To-kaido, Nakasendo, Koshu-kaido, Nikko-kaido and Oshu-kaido (Do or Kaido means road) converged at Yédo and men and goods came to the Shogunate capital along them and their by-roads from the remotest corners of the land. Coasting sea transportation had the following four main lines: the South Sea line between Yédo and Osaka, the West Sea line between Osaka and Nagasaki, the North Sea line from Shimonoseki to Matsumaé, and the East Sea line between Oshu and Yédo; the most

Digitized by Google

important of these being the South Sea line which connected Yédo the greatest consuming city and Osaka the greatest commercial centre.

On the other hand industry was still undeveloped and most articles were made by handwork in the individual houses. Industry with large capital and in factories was limited to brewing at Nada, weaving at Ashikaga, Kiriu near Yedo and Hakata in Kyushu, metal foundries in Chugoku and shipbuilding.

The seclusion policy quenched the enthusiasm of the Japanese for foreign trade which had been greatly stimulated at the time of Nobunaga Oda. The Islanders were compelled to fall back on the old economic system of self-supply and self-sufficiency, unwillingly relinquishing the international spirit that had aspired to things Western on far larger a scale than that of China centuries ago.

At the same time, however, it resulted in the creation of many industries and fine arts purely Japanese, and the work of the artisans became minutely specialized in the course of time, numbering over 150 kinds. The artisans were united in guilds according to their kinds, which protected their rights and profits, master, artisans and apprentices comprising each house. There were government purveyors who were protected by the Shogunate and accumulated wealth. The number of merchants greatly increased and the classes of the wholesale merchants, middle men and retailers were definitely established. The wholesale dealers organized associations and gradually acquired real power over the samurai and the lords from their financial ascendancy.

The lowest stratum of society was composed of day labourers. They were (1) common day labourers, (2) kumosuké or coolies, (3) house servants and maids, and (4) women weavers. There was a still lower class of people called Yéta or Hinin (the unclean or no-man) whose intermarriage with the other classes was strictly prohibited and who were engaged in such business as straw-slipper making, leather work, digging graves and acting as night-watchmen and executioners.

Ronin A characteristic phenomenon of the Yédo Age was the appearance of the Ronin or masterless samurai. Such samurai had existed in previous years, but at the time of the despot Toyotomi their number was insignificant. The samurai who had followed lords defeated and ruined in battles became 'ronin' and their number was added to by the extinction of noble houses in punishment for rebellion, and the unemployment of the sons of samurai, other than the first born, who had no share in the inheritance of their father's property or position. Some samurai voluntarily chose the life of a 'ronin'. All these lawless 'ronin' lived from hand to mouth and were either at odds with the ruling class or gave constant trouble to the common people. The event mainly responsible for the creation of this class of people was the battle at Sekigahara (1600 A.D.) which decided the supremacy of the Tokugawas over the Toyotomis. In the 13 years between that battle and the Osaka battle which ended in the final destruction of the Toyotomi family, the number of the lords entirely ruined or partly deprived of territory reached over 100 and the confiscated area to approximately 9,000,000 koku. Some found second masters but the larger number of the samurai were thrown out of work. The Osaka battle was caused by these samurai in a last attempt to preserve the power of the Toyotomis, although it ended in their complete failure. Again, in

Digitized by Google

the 23 years between the Osaka battle and the Shimabara Rebellion in 1637 another 70 lords lost the whole or a part of their territory by the relentless application of the Buké Hatto, and indeed the Shimabara Rebellion was nothing but an outburst of complaints by the Catholics and the ronin against the oppression of the Shogunate. But the power of the Shogunate was unshakable. The number of the ronin, however, was still more increased, and in the 4th year of the Keian Era, 1651, Yui-no Shosetsu and his colleagues attempted a change of the Shogunate government for the benefit of the ronin, although it was suppressed by the wholesale arrest of the ambitious leaders and the harakiri of Yui-no Shosetsu himself on July 25 of that year. There were minor events caused by outbreaks of the ronin here and there and at last the Shogunate was awakened by these uprisings to the graveness of the situation and after the Keian Era measures were taken to prevent further increase in the number of these masterless samurai. As a rule, in obedience to Bushido ethics, the samurai did not like to take a second master, and only a small portion found positions, while the rest either remained unemployed or chose some other occupation. Some became merchants or farmers. Others became scholars and opened Terakoya and educated the young in Confucianism and Japanese literature and morals. Still others became specialists in military arts and gave lectures to the samurai and the lords, while there were quite a number of experts in fencing and archery who opened drill-halls or schools in the larger cities. The better element of the ronin played an important part in the social development of the country standing in a freer position than the regular samurai. And the last and most praiseworthy task they accomplished was to take a prominent part in the movement for aiding the Imperial House which finally led to the Meiji Restoration.

Exclusion Policy

Policy of Toyotomi The Catholic faith spread over Japan very quickly and many churches were built in various places. But the dogmas and institutions of the Church were in many ways unfitting to Japanese ideals and customs. Besides, the friars or missionaries behaved themselves without discretion, disregarding the laws of the nation, partly tempted to this by the humble attitude of the Japanese officials toward the foreigners, out of their wish to profit by the foreign trade. Hideyoshi Toyotomi therefore destroyed the Catholic Church in Kyoto in 1585, and issued a Prohibition Law in 1587, forbidding the residence of missionaries at Nagasaki and other places. But he still allowed foreigners who did not mean to spread the religion to come.

A little later, when trade with Luzon was opened, Spanish missionaries came to Japan. These missionaries were antagonistic to the Jesuits and tried to preach another form of doctrine among the Japanese people in the face of the Prohibition Law, and quarrelled with the Portuguese missionaries. Hideyoshi again issued a more drastic prohibition law and severely punished them; but he died without accomplishing his aim, and both Portuguese and Spanish missionaries came in greater numbers and preached the Gospel more earnestly so that the believers in it increased with remarkable rapidity.

Policy of Iyéyasu Iyéyasu followed Hideyoshi's steps and encouraged foreign trade. But being anxious lest the people should be misled by

Digitized by Google

the Catholic priests he prohibited their preaching in 1612, expelled them from the country, and strictly ordered the Japanese believers to turn from their faith, and those who did not obey his order were condemned to death. They called this turning from or casting away the Christian faith "Korobi" or rolling over.

Going Abroad Prohibited But missionaries came, pretending to be merchants, in considerable numbers, and secretly continued to spread Christianity. The Shogunate saw the difficulty of complete prohibition, and began to take stricter steps. Iyémitsu, the third Shogun, prohibited the importation of foreign books in 1630, forbade any one to go out of the country without permission of the Government in 1633, and prohibited the going abroad of any Japanese in 1636. Finally, no Japanese was allowed to return from other countries. And thus the ambition of the Japanese for foreign expansion was quenched.

Seclusion of the Nation The Shogunate kept a strict watch against the coming in of the Catholic faith and tried to exterminate the believers in the country. Their measures were so severe that the Christian believers arose in rebellion at Shimabara in 1637. The uprising was subdued in a short time, but because of it the Shogunate determined to go a step farther in carrying out the law, and prohibited the coming of foreign people entirely in 1639, with the only exception of the Hollanders who helped the Shogun's armies in the fight against the religious mob at Shimabara and cherished no idea of spreading the Catholic faith among the Japanese. Hollanders were allowed to trade at Nagasaki, although it was done under the guard of the Samurai.

With this strict seclusion policy the Shogunate was able to root out Catholicism and remove from the minds of the people the influence of foreign thought and belief, and so gain peace in home affairs. But during those years, foreign affairs became known to only a few of the Shogunate upper officials, and this merely through meagre reports presented by the Dutch Consul, and the people were kept in entire ignorance. The result of it all was the Japanese isolation from the nations of the world and the country's dropping behind out of the ranks of world civilization.

But general movements among the nations of the world did not allow Japan to stay forever in a secluded condition. In the 18th century, foreign ships began to visit Japan, and the Islanders could no longer leave these intruders at their shores unheeded. The end of the Yedo Age was evidently drawing near.

Foreign Studies Renewed Seventy years after the enforcement of seclusion, books on foreign trade and the state of affairs in the Western world were published and the people were much instructed by such literature. The Shogun Yoshimuné took an interest in Western studies and followed a liberal policy for importing Western books in 1720, and this brought about a Renaissance which awakened the Japanese from their long sleep.

Seclusion Law Re-enforced The Seclusion Law required the provincial lords to drive foreigners away from the shores of the Empire, but its observance grew lax with the lapse of time. At the end of the 18th century the Shogunate made it milder and allowed foreign ships to come, on condition that they had no enmity to the nation, and still later the Government treated them very humanely. Unfortunately, however, the repeated rough conduct of the

Digitized by Google

English shipmen irritated the official mind to the last limit and they were compelled to re-enforce the old law, giving orders to the coastguard to bombard any foreign boat which came near the shore, and to arrest any of their crew who landed forcibly, and kill them if necessary. At the same time, they gave strict orders to the Japanese boats not to have any intercourse with foreign vessels (1825).

National Doors Opened

An American ship, the "Morrison", came to bring members of a Japanese shipwrecked crew back to their country, met with the bombardment, and went back to China in 1837.

In 1844, William II, King of Holland, sent a confidential letter with a special delegate to Japan, to warn that country to be careful not to follow the miserable example of China. Merchant vessels and warships of England and France many times came to the Loochoo Islands and the French made a forcible landing at Naha, the best port of the Loochoos, put missionaries ashore there and asked for the opening of friendly intercourse in 1844. The Shogunate complied with their request for trade, but drove the missionaries away in 1848.

Treaty of Amity with America In the sixth year of Kaei, 1853, Commodore Perry came to Uraga with a fleet of four warships. A friendly treaty was finally concluded between Japan and America in 1855.

Treaty with Russia Russia also sent Vice-Admiral Poutiatine to Nagasaki in 1853, and a treaty of commerce with Russia was concluded opening Shimoda, Hakodaté and Nagasaki for her vessels, and making agreements respecting their boundaries in the north.

At that time England and Russia were at war, and in 1854 an English warship came to Nagasaki for a supply of provisions. The Shogunate consented to open Nagasaki and Hakodaté for English vessels, and an agreement was reached between the two nations. Hakodaté and Shimoda were opened to Holland also and a treaty was concluded in 1855.

Conclusion of Commercial Treaties In 1856 the United States sent to Shimoda her Consul General, Townsend Harris, who finally succeeded in coming up to Yédo and got an interview with the Shogun Iyésada in 1857. He earnestly requested the Government's consent to open trade relations, and asked that an American minister might be stationed in Yédo, assuring his hearers of American sincerity. The foreign trade allowed hitherto by the Shogunate was only through the mediation of the officials, and Harris insisted upon free and direct commerce between the merchants of the nations.

The Shogunate officials themselves, already aware of the inconveniences of the old system, complied with his requests, regularly concluded a friendly commercial treaty with the United States, and agreed to open New Kanagawa (the present Yokohama), Nagasaki, Niigata, and Hyogo (Kobé) in addition to Shimoda and Hakodaté. They allowed Americans to settle in those ports for trade, gave them freedom to come in to Yedo and Osaka, recognized their freedom of religious belief and extraterritorial jurisdiction, and regulated the rate of tariff in 1858. This was the so-called Ansei modus vivendi.

In the same year the treaty was sanctioned by the Shogunate, without the Imperial grant. The Shogunate concluded similar treaties with Holland, Russia, England, and France in the same year; and with

Digitized by Google

Prussia, Switzerland and Belgium a little later.

Opening of the Country The Government appointed a commissioner to administer foreign affairs in 1858, and the Shogun earnestly requested the Imperial sanction for the provisional treaties, and finally got it in 1865. The carrying into practice of all these treaties was realized with the opening of Hyogo (Kobé) port in 1867, the year of the accession of the Emperor Meiji. In the meantime, several international troubles occurred. Russia tried to invade Tsushima in 1861, Satsuma warriors fought against an English fleet off Kagoshima in 1863, and the Nagato clan had an engagement with the combined fleets of France, England, Holland, and America at Shimonoséki in 1864.

Downfall of the Shogunate

Court and Shogunate The Yedo Government adopted the policy of keeping the Imperial Court at a respectful distance, paying apparent homage to it, but actually presenting it only with 120,000 koku of rice, the pension of a middle-class lord.

Uprising of the Loyalists On the other hand the smouldering fire of loyalty to the Imperial House was gradually fanned into a blaze by the increasing attention paid to the study of Confucianism and old Japanese literature. Confucian scholars taught that the first duty of the people was to be loyal to the King (Emperor) and not to the Conqueror (Shogun), while the students of the old Japanese literature explained the irrationality of the Shogunate régime in the country of which the sovereignty belonged solely to the Imperial House. Down to the middle of the Yédo Age, however, these teachings did no harm to the Shogunate for both the ruling class and the people took them as mere matters of academical interest without practical application. Mitsukuni Tokugawa, the lord of Mito was among the foremost in advocating the virtue of loyalty to the Imperial House, himself beginning a work of the compilation of Japanese history to make this characteristic Japanese virtue clearly understood, and erecting a monument to the loyalist Masashigé Kusunoki at Minatogawa, Kobé. And such scholars as Ansai Yamazaki, Keisai Asami, Soko Yamaka, etc. mostly praised the virtue of loyalty, though not necessarily to incite any anti-Shogunate sentiment. Their teachings, nevertheless, acted to stimulate Imperial loyalty in the hearts of the samurai and the people till the time came when it should burst into flame.

The first instance of these sentiments being transformed into practical action was the movement of Takénouchi Shikibu who came from Niigata to Kyoto and went about among the Court nobles insisting upon the need of a loyalists' uprising. He was banished by the Shogunate in 1759. Daini Yamagata and Umon Fujii followed him, but both were soon put to death. However, the corruption and weakening of the Shogunate régime quickened the anti-Shogunate feeling in general towards the end of the 18th century. Especially the renaissance of Japanese literature and national character brought about by the teachings of the Japanese scholars, Norinaga Motoori and Atsutané Hirata greatly helped the cause of the loyalist movement. Hikokuro Takayama went around the provinces propagating the principle; Kumpei Gamo visited the tombs of the deceased Emperors and publicly bewailed their neglected state. Sanyo Rai wrote a Japanese history in which he praised the Imperial House and chastised the Shogunate with a

Digitized by Google

keen and powerful pen.

The knocking at Japan's doors by foreign countries presented ample chances for the loyalists to take advantage of the confusion and misdoings of the Shogunate Government, and public opinion finally endorsed their movement at the beginning of the 19th century.

The Ansei Coup d'État When Komei, father of Meiji the Great, came to the Throne, he did not hesitate to give Imperial suggestions and command to the Shogunate, and the Imperial power was greatly strengthened. The party which was defeated in its hopes for choosing another man for the 14th Shogun schemed a reformation of the Shogunate from within. They united with other forces and asked for an Imperial edict to accomplish their plans. The Emperor issued an edict and reprimanded the Shogunate for their rudeness in concluding treaties without the Imperial permission. Whereupon the Shogunate sent a delegate to apologize for their mistake, but at the same time the Tairo (premier) Naosuké Ii declared the coup d'état of Ansei, 1858, and punished and put into prison all who worked for the issuance of the Imperial edict. His purpose was to reestablish the governmental authority of the Shogunate. But Ii was assassinated at the Sakurada gate of the Shogun's palace in 1860.

The assassination of the Tairo gave what was to prove a final blow to the Shogunate though the Roju, Nobumasa Ando, schemed a combination or amalgamation of the Imperial Court and the Shogunate to save the latter from ruin. Some of the powerful lords in the west responded to the idea for a time, but public opinion was overwhelmingly against this amalgamation movement on the part of the pro-Shogun party, and the anti-Yedo movement increased still more in power. Most of the loyalists gathered in Kyoto and hotly discussed the matter. The ronin or unemployed samurai flocked to the cause in such great numbers that it was necessary for the armies of the lords of Satsuma, Tosa and Choshu to keep them in bounds in order to preserve the peace of the city.

On the other hand, the Emperor Komei sent a messenger to Yedo to urge the reformation of the Shogunate Government. The Shogun Iyeshigé tried to make improvements in the system of Sankin-kotai, etc., but it was too late to regain the support of the people. The Namamugi incident, in which three Englishmen were killed or injured by the lord of Shimazu's samurai and England demanding compensation, stirred the extreme anti-foreign party to fury and the Kyoto Court sent Sanétomi Sanjo this time to Yédo and ordered the Shogunate to wage war against all foreigners. In 1863 an Anti-Foreign Edict was issued by the Shogunate, and the armies of the Choshu and Satsuma lords attacked foreign merchant ships and warships. The fanatical Kyoto loyalists demanded that a nation-wide anti-foreign movement should be launched, and the Emperor was inclined to take command of the movement himself, but the more sagacious and saner-minded princes and lords advised him to realize the unwisdom of anti-foreign action, and the leaders of the radical element lost influence and fled to the west. For a while the schism among the loyalists persisted, but the object lesson of the bombardment of Shimonoseki by a combined foreign fleet weakened the anti-foreign movement to a great extent. By 1867, when the Emperor Meiji ascended to the Throne, the anti-foreign movement had died away and the loyalists were solely

Digitized by Google

concerned with the destruction of the Shogunate régime, recognizing the inability of the Shogunate to sustain the national honour in the crisis.

Prince Sanetomi Sanjo, one of the seven court nobles who had fled to the west, joined Prince Tomomi Iwakura in leading the anti-Shogunate movement. The hostility between the two greatest of the western lords, Shimazu, lord of Satsuma province and Mori of Choshu or Nagato, was pacified by the arbitration of Prince Sanjo and they became strongly united in the common cause. Prince Iwakura succeeded in making a definite plan for the destruction of the Shogunate, gathering many young and gifted samurai under these two lords, such as Takamori Saigo, Toshimichi Okubo of Satsuma and Takayoshi Kido of Nagato, etc., and asked the Imperial sanction for their movement.

On October 14, 1867, the Emperor Meiji gave orders to the Satsuma and Choshu lords to open hostilities against the Yedo Government. On the side of the Shogunate Toyonobu Yamanouchi, former lord of Tosa in Shikoku, was informed of this secret plan of the Imperial army, and being anxious to avert the impending civil war sent Shojiro Goto to present a memorial to the Shogun Yoshinobu (Keiki) Tokugawa, advising his surrender of the sovereign authority. Whereupon Yoshinobu, who was staying at Kyoto, immediately called an assembly of the representative samurai of the lords then staying in the city to the Nijo Castle on October 13, 1867, and asked their opinion on his determination to surrender. The assembly gladly agreed to his decision on the initiative of Shojiro Goto and Tateaki Komatsu, a subject of the Satsuma lord. On October 14, Yoshinobu presented a written request for the Imperial permission, and on October 24 the resignation of the Shogun was formally tendered to the Throne. Thus the Yedo Shogunate ended with the 15th Shogun, after having continued for 265 years, and after a total period of 675 years the sovereign authority was restored to the Throne.

The Meiji Restoration

In December of the same year, the Emperor Meiji issued an important order abolishing the old officialdom and forming a new Dajokan which should consist of the president, councillors and vice-councillors, and proclaiming the direct rule of the Throne in every line of national government. The Imperial Prince Arisugawa was appointed President of the Dajokan, and those court nobles and feudal lords who had faithfully worked for the restoration were given the position of councillors, while some other men of ability were made vice-councillors from among the nobles and common samurai, and the people were allowed to live in complete equality, discarding the old castes of nobles or common people. This change was called "Ishin" or the renovation of all things. In the following year, 1868, or the first year of Meiji, the Emperor by the advice of Takayoshi (Koin) Kido, a vice-councillor, called together the princes and high officials to the Shishin-den or central palace and took the famous oath of five articles before the ancestral gods. These five articles of the Imperial oath provided the foundation to the new régime. They were as follows: "(1) We will call councils and rule the nation according to public opinion; (2) Men of upper and lower classes without distinction shall be united in all enterprises; (3) Civil officials and military officers shall be in one accord and all the common people shall be so treated that they can attain their

Digitized by Google

aims and feel no discontent; (4) Old unworthy ways and customs shall be destroyed and the people shall walk along the highway of heaven and earth; and (5) Knowledge shall be sought among the nations of the world and the Empire shall be led up to the zenith of prosperity. To accomplish this unprecedented reformation, We go before the people, and proclaim the fundamental national principles, even in the presence of the gods of heaven and earth, to establish the way for the public welfare. Ye, Our subjects, shall be united all together, according to these principles." In August of the same year, the formal celebration of the Emperor's ascension to the Throne was held at the central palace, and in September the year-name Meiji was given.

Removal of the Capital The Emperor Meiji paid his first visit to Tokyo in the first year and made the castle of Yédo his permanent palace in the second year of the new era. The Government was subsequently removed to Tokyo.

The Organization In the first year of Meiji, 1868, a new Central Government was established in accordance with the five principles above mentioned. It was called Dajokan, or Great Government, and there were seven departments in it. The council played the part of the future parliament; the five departments of general political, religious, financial, and military and foreign affairs were administrative; and the last penal department took charge of justice. And the mutual independence of the legislature, the executive and the judicature was for the first time established. In a few years several adjustments were made, but by the fourth year all the official machinery of the central government was systematically arranged.

Surrender of Fiefs The Imperial Court had confiscated all the territory belonging to the old Shogunate, and set up prefectural offices and appointed governors, but the feudal lords still owned their lands and their feudal subjects. In the first year of Meiji, Takayoshi (Koin) Kido submitted an opinion on the surrender of all feudal possessions to the Emperor, to complete the purpose of the Restoration, through Sanétomi Sanjo and Tomomi Iwakura; and at the same time he advised Lord Mori, Daimyo of Nagato, to return his territory to the Court, and the latter agreed and was willing to do so. Thereupon Takayoshi Kido worked with Toshimichi Okubo and succeeded in getting the consent of Lord (Daimyo) Shimazu of Satsuma, Lord Nabeshima of Hizen and Lord Yamanouchi of Tosa. These four lords tendered their petition for the territorial surrender in joint signature. Other lords followed them, and their petition was accepted in the second year. The lords gave up all their land and people, asking for nothing in return in a most admirable spirit of patriotism and loyalty. For the time being they were requested to continue as governors of their districts, and the feudal system was completely destroyed.

The country was divided into 8 urban prefectures, 26 prefectures and 262 clan districts. But the governors of clan districts, the former feudal lords, governed their people mostly in the old style, preserving the "chief-and-subject" relation. The orders and ways of administration were greatly distorted and the authority of the Central Government was ineffective. Fortunately, however, Yoshii of Gumma and Sayama of Osaka soon resigned their governorships, realizing the defects of the system, and many others followed their lead. Kido again was

Digitized by Google

quick enough to grasp the situation, and taking advantage of the general trend he endeavoured with his powerful friends Toshimichi Okubo and Takamori Saigo to do away with the clan governors and unify the whole nation under the same form of prefectural government. The Emperor called all the clan district governors to Tokyo in 1871, and kindly explained to them about tbe abolition of their office. They were given conveniences to live in Tokyo, and were replaced by the prefectural governors. Through many changes, the country was finally divided as at present into one "Do", three urban prefectures and forty-three prefectures in 1889. (Foreign relations are dealt with in Chapter VI.)

Social Reforms

After the cessation of samurai government the social system could not remain unaltered. In 1869, when the resignation of the lords was accepted, the name of "Kugé" (court noble) and "Daimyo" (feudal lord) were abolished and the nobles and lords were all made "Kazoku" (flowers of the nation) or peers. Clan samurai were given the class-name of Shizoku, and in the following year the common people were allowed to take their own family names, which they had not previously borne. In 1871, intermarriage was permitted between the peers and Heimin or common people, while the peers and "Shizoku" were allowed to engage in the ordinary business of agriculture, industry and commerce. Thus the social castes of the feudal age were entirely broken to pieces. Social institutions and customs changed also. With the official recognition of friendly intercourse with foreign people, international traffic and relations became busier and more intimate. Many a Japanese who went abroad brought back Western customs and introduced new institutions, and the people were quick to adopt them in their social daily life. In the second year of Meiji telegraphic communication was opened between Tokyo and Yokohama; in the fourth year, the regular mail service began between Tokyo, Kyoto and Osaka; and in the fifth year, the first train ran between Tokyo and Yokohama. In the fourth year, men were ordered to cut off their topknots and walk on the street without wearing a sword. In the same year, laws regarding European costumes and uniforms of officials were issued, the old lunar calendar was discarded and the solar calendar was adopted in its place, and national holidays were newly appointed. In 1871, the Department of Education was added to the Government and, in 1872, the national educational system was established and it became compulsory for all children to be sent to public elementary schools. Buildings in European styles began to appear in the cities and people gradually acquired a taste for foreign food.

New Military System

After the appearance of the Samurai class in the middle age they held all the military power in their hands, and the people at large had nothing to do with it. But with the reforms following the Restoration, the military system was also revised and in the fifth year of Meiji the provisional Department of Military Affairs was changed into the two departments of Army and Marine, and in the following year the law of conscription was issued and, in accordance with the old-time ideas of the Japanese and on the pattern of the European powers the people were all ordered to share in universal military service for the protec-

Digitized by Google

tion of the country. The military system has made singular progress through many national crises in the Meiji Era.

Cultivation of Hokkaido

At the beginning of the Meiji Era the cultivation of the waste land of the north was proposed, and in the second year the Colonization Bureau was opened. The name Hokkaido, or north-sea-district, was given to the land, formerly known as Yezo. In the third year, Kiyotaka Kuroda was appointed vice-president of the Bureau and he made untiring efforts to civilize the natives, to construct roads, to promote industry and to encourage immigrants from the other islands. In 1875, he invited the Samurai class of the three north-eastern prefectures of the Main Island to form a colonial militia to let them guard and cultivate the land at the same time. The farming and population of Hokkaido have rapidly increased since. A troublesome question in the north was the boundary between Japan and Russia. The Shogunate had had several diplomatic negotiations with the Russian admirals, and at the beginning of the Meiji Era this question again arose with the opening of the Colonization Bureau. Japan's wish was to divide the Island of Saghalien into two with the border line at 50° north latitude. Kuroda wished to abandon Saghalien and concentrate all efforts on the colonization of Hokkaido, and the Government sent Vice-Admiral Buyo Enomoto to Russia and tried to settle the question. In 1875 a compromise was reached and the whole of Saghalien was adjudged to belong to Russia and all the Kurile Islands were given to Japan. This so-called exchange of Saghalien and the Kuriles finally settled the long dispute over Japan's northern boundaries.

Civil Wars

The Cause The political and social reforms of the Meiji Restoration were so vast in scale and so rapid in progress that the mass of the people could hardly understand their need and meaning, being still prone to the old ways and systems. There were some who were offended by various policies of the Government. Those people became a constant cause of political and social unrest, there were repeatedly assassinations of high officials; while in the country districts disturbances broke out one after another. Shimpei Yeto, caused some troubles in Saga prefecture; but he was soon subdued by the Imperial army. In Kumamoto, an adjacent prefecture to Saga, Otaguro and others formed a party which was called the Jimpuren or Divine-wind-party, and made an attack on the Kumamoto garrison in 1876, only to be defeated by the soldiers of the garrison. At Hagi, the north-western end of the Main Island, Maehara arose in accord with the Jimpuren party, but he was also killed and his men dispersed.

The Saigo Rebellion Takamori Saigo could not realize his ideas about the Korean problem, and was deeply grieved at the failure. After his resignation he went back to his native place, Kagoshima, at the southern end of Kyushu Island. Over a hundred officers and soldiers who had been under him in the Tokyo Imperial Guard followed him to the city and it caused a great commotion in the country. His followers, such as ex-major-generals Kirino and Shinowara, elected Saigo to the leadership of their party and the head of their private school. In 1877 Saigo, Kirino and Shinowara gathered an army of over 15,000 soldiers, proclaiming their intention of impeach-

Digitized by Google

ing the Government for its social and political failures, and came up to Kumamoto and besieged the Kumamoto castle of the Imperial garrison. But the commander of the garrison, Major-General Tateki Tani, bravely fought against Saigo's army and did not surrender. The Emperor Meiji was then travelling in the districts near Kyoto and Osaka, and stopped in Kyoto to take command of the Imperial army. He appointed the Imperial Prince Arisugawa to be Commander-in-Chief, and Lieutenant-General Aritomo Yamagata and Vice-Admiral Sumiyoshi Kawamura to be the heads of the army and navy respectively. Saigo's troops were compelled to raise the siege under the pressure of the big Imperial armies, and they retreated in disorder back to Kagoshima, and made Shiroyama their final stronghold. Shiroyama was a promontory in the outskirts of the town and there the great Saigo killed himself with his colleagues in the face of the assailing Imperial soldiers. This rebellion was really the last of the civil wars accompanying the Restoration. After this South-Western Civil War, the wounded soldiers, loyalist and rebel alike, were cared for impartially at the Imperial army hospitals, and the Emperor Meiji, the Empress and the Empress-Dowager showed them special kindness. It may be mentioned that the Japan Red Cross Society was founded on this occasion.

Dawn of Constitutional Government

The Constitution In the first year of Meiji, government institutions were reformed in many ways, and representatives of prefectures were made members of the lower council. In the following year the public assembly was opened, and the prefectural representatives became its members. But this assembly consisted of members who were all chosen by the Government, and it gave rise to a demand for the establishment of an assembly of representatives really elected by the people. In 1873 Kido, who had come back from his European tour of investigation, proposed the establishment of the national constitution; while, in 1874, Soyejima, Goto, Itagaki and Yeto presented a petition for the establishment of parliament by popular election. The Government did not adopt either proposal as the time was not yet ripe, but in 1875 they established the Genro-in, a kind of Senate, as the chief seat of legislation, and the Supreme Court of Judicature for the administration of justice, and summoned district governors to Tokyo to learn of the requirements of the people. In 1876, the Emperor ordered the Genro-in to make plans for the formation of the Imperial Constitution and in 1879 prefectural assemblies were opened for deciding on district finances and representative government was first tried in the local districts.

Prefectural Elections The South Western Civil War was ended and the foundation of the Central Government became unshakable. But in a few years Japan lost most of her able statesmen one after another. Saigo died in the battle just mentioned, Kido passed away from illness, and Okubo was assassinated in 1878. These were the three pillars of the Reformation, and Shigénobu Okuma, Hirobumi Ito and the like had to carry on their strenuous task. Public faith in these new statesmen was not yet assured, but they were young and progressive and endeavoured to absorb Western ways and civilization for the benefit of the rising generation. In April, 1878, the second local governors' conference was held and Ito was its

Digitized by Google

chairman. The items for discussion were rules on prefectural assemblies, local taxes, and the organization of towns and villages. In July of the same year the rules on prefectural assemblies were issued, and according to the articles public election of representatives and local self-government were for the first time put into practice in the following year. This was a further step toward constitutional government. As a matter of fact, it might be considered a rehearsal of the formation of a national diet. The election was most sincerely carried out, because the people honoured the candidates as those who must in truth represent them not only in wisdom and political ideas but also in personality and social standard. The result was that the prefectural assemblies were composed of the best class of men in the districts. For instance, the chairman of the Tokyo prefectural assembly was Genichiro Fukuchi and the vice-president was Yukichi Fukuzawa, founder of Keio-Gijuku University, while the members were all men of honour. The famous members of the Imperial Diet and great statesmen of later days mostly came out of these primitive local assemblies.

Political Dissensions Political dissensions, which had appeared even under the turmoil of military struggles, came to the fore, and hot discussions on both sides were carried on both in debates and through printed pamphlets. The one who attracted most public attention with his progressive opinions was Taisuké Itagaki of Tosa. In September, 1878, a meeting was held at Osaka under the leadership of Itagaki's society to pass a resolution calling for the realization of the national assembly. It was a meeting of Samurai-class people as yet. But their second meeting, in March, 1879, gathered together 80 members who represented 21 societies in 19 prefectures, and the third meeting in November made resolutions to send a petition to the Emperor, and drafted a letter with a long heading, "Letter of Appeal to the Public for demanding the establishment of the National Assembly," which was printed and distributed among the people.

Petition for Opening Diet In the city of Okayama, a little west of Kobé, hot-blooded young politicians composed a manifesto and distributed it, whose earnest and beautiful sentences moved their youthful contemporaries more strongly than the first had done. When the fourth meeting of the Patriots' Society was held at Osaka in April, 1880, 114 delegates from the 87,000 members of different societies met together, formed the "Volunteers' Association for Demanding the Opening of the National Assembly," and drafted a petition. It is said that over 50 such petitions were presented to the Government during the one year of 1880. In the midst of such movements a new scholar of French politics, Kimmochi Saionji, the only surviving Genro or Elder Statesman at present, came back from Paris and published the "Toyo Jiyu Shimbun" (Eastern Liberal News), and instructed the people in the principles of liberal politics, to the great surprise of the authorities. The acute state of affairs seemed to presage the early appearance of an Imperial Diet when the political events of 1881 occurred.

Imperial Edict Issued In that year the Government was going to sell to the Kansai Trade Society the land, buildings, ships, dock and hunting fields which belonged to the Colonization Bureau. The actual price was estimated at a little over ¥300,000, while the Government invested and spent as much as ¥14,096,800 for

Digitized by Google

them. There was a strong suspicion of favouritism for the Kagoshima merchants, for many of the high officials came from that district, and criticisms arose against the abuse. This public criticism was caught up by those who demanded liberty and they bitterly censured the official autocracy. The very evening of his return from a tour of the northeastern districts on the 11th of October, the Emperor Meiji gathered together the members of the Cabinet and the councillors and a meeting was held in his presence at which it was resolved that the government sale should be stopped at once and that the Imperial Diet should be summoned in the twenty-third year of Meiji, (1890). These resolutions were published in the Imperial edict issued on the following day, October 12th, 1881. With the issuing of this edict the boisterous outbursts of discussion and debate among the people gradually died down and political parties began to be organized for carrying out their political principles in readiness for the opening of the parliament ten years later. The principal ones were the Jiyu-to, Liberal party of Taisuké Itagaki and the Kaishin-to, or Progressive Party of Shigenobu Okuma.

Preparation of Constitution In 1882 the Government sent Hirobumi Ito to make thorough investigations regarding Western institutions, to find good models and suggestions for the Japanese parliament. Ito and his attendants mostly stayed in Germany and there studied Western politics and constitutions, and came back in the following year. In 1884 the Government established an Investigation Bureau in a part of the Imperial Palace and appointing Ito the president of the Bureau, ordered him to make out a draft of the Constitution and plans for the new institutions. It was in this year that a law for the peers was enacted and the five ranks of nobility—prince, marquis, count, viscount and baron—were first defined. In 1885, at the instance of Prince Sanjo and to lay the foundation for true constitutional government, the officialism of the Central Government was reformed and a real Cabinet of a modern nature was formed for the first time, the old positions of councillor and minister being abolished. It consisted of the Premier and Ministers for Home Affairs, Foreign Affairs, Finance, Army, Marine, Justice, Education, Agriculture and Commerce, and Communications. The function of these ministers was to take joint responsibility on national politics in place of the Emperor and help him in good government over his faithful subjects. In the Court there were the Naidaijin or Keeper of the Privy Seal and the Minister of the Imperial Household. The first Premier was Ito himself, who held the additional post of the Ministership of the Imperial Household. In 1888 the Privy Council was established, the most excellent and patriotic statesmen were appointed to its membership, and it was made the highest body for the Imperial consultation on important political affairs. Ito again was the first President of the Privy Council. The draft of the Constitution was completed by this year and the Emperor put it before the Privy Council as the first item of discussion. The Emperor Meiji was present in all sessions on the Constitution, earnestly listening to the opinions of the different members, and played a great part himself in the resolutions.

Promulgation of the Constitution On the 11th of February, the 2549th anniversary of the accession of Jimmu Tenno, 1889 in Western reckoning, the Emperor Meiji reverently

Digitized by Google

reported the promulgation of the Constitution to the ancestral gods and appeared in person with the Empress before the Imperial Princess, Cabinet ministers, high officials, representative people, and foreign ministers, and solemnly issued the Imperial Constitution. (See Appendix.) He issued an accompanying law relating to the Imperial family which regulated future accessions, and relative positions of the Imperial Princes, that no trouble might ensue on the question of the successor to the Throne. Other laws which were to accompany the Constitution were on the election of the members of the lower house of parliament and the institution of it. They were issued in the same year, and in November, 1890, the first Imperial Diet was convened in Tokyo and the opening ceremony was held in the presence of the Emperor. Local self-government had been established and improvements made in the institutions of cities and towns for the past two years and in this year another improvement in the prefectural and county institutions was made, confirming their self-government, although the county government was abolished later.

Laws Since the downfall of feudalism and return of fiefs to the Emperor, the enacted uniform laws for the proper control of the people became an acute necessity and the Government first took in hand the criminal laws and issued revised ones in the sixth year of Meiji. Other laws were revised or newly compiled according to the need of the progressive society and with due regard to foreign relations. The code of civil procedure, the commercial law and the civil law were enforced by 1899. The criminal law was revised in 1908 and the code of civil procedure in 1924 according to the advanced ideals and needs of the times.

Revision of Treaties
(See Chapter VI)

Sino-Japanese War

The War In August, 1894 Japan declared war against China, and the Emperor located his headquarters at Hiroshima to command his armies more effectively. Lieutenant-General Notsu routed the Chinese soldiers and drove them back from the boundaries of Korea in that month, and Vice-Admiral Yukyo Ito, Commander-in-Chief of the combined fleet, defeated the Chinese North-Sea fleet on the Yellow Sea. In October, Commander Aritomo Yamagata led his First Army through Chosen to Southern Manchuria and advanced victoriously to the west, while Commander Iwao Oyama, head of the Second Army, crossed the Yellow Sea and entered China direct, to act in conjunction with the Imperial fleet on the sea. Port Arthur was captured in November and Weihaiwei in February, 1895, and the Chinese naval power was annihilated. In March, the peninsula of Liaotung was seized by the Japanese armies and Peking was threatened by attack, while Southern China lay at the mercy of the Japanese fleet. The Emperor Meiji appointed Imperial Prince Akihito Arisugawa generalissimo over the whole army and navy to reduce China to submission. China yielded and asked for peace, appointing Li Hung-chang ambassador. Japanese ambassadors Premier Ito and Foreign Minister Mutsu met him at a peace conference at Shimonoseki. According to the peace treaty concluded in April, 1895, China recognized Korean independence, gave Japan the Liaotung Peninsula, Formosa and Boko Islands, paid about ¥300,000,000 to her, and opened four new ports for trade.

Return of Liaotung In alliance with Germany and France Russia inter-

Digitized by Google

vened and advised Japan to give back the territory to China, and the Peninsula was returned to China at the end of 1895 for an indemnity of about ₹45,000,000.

The newly acquired territory of Formosa was first governed by Governor-General Kabayama. In 1896, the whole island of Formosa was pacified and the new people began to understand the Japanese rule. In 1898 Gentaro Kodama became the Governor-General and encouraged industry and improved traffic so much that the Island was really transformed into a valuable part of the Empire. After the Sino-Japanese War, the Japanese Government and people united their efforts in many enterprises. Military preparations were strengthened, schools improved in number and quality, industry and commerce throve, communications were also greatly improved, and the national power remarkably augumented. In 1897 Japan adopted the gold standard, on the foundation of the gold coin received from China as indemnity.

The Boxer Rebellion In the meanwhile, anti-foreign feeling began to spread over the Chinese people, and, in 1899, the so-called "Boxer Rebellion" suddenly broke out in Shantung. The party hoisted the banners of "protect China, exterminate foreigners", murdered many Christian missionaries, destroyed churches, and, in the following year, advanced to Tientsin and attacked the residences of Europeans there. Later they united with the Government soldiers controlled by the Empress-Dowager and coming up to Peking attacked the foreign legations, some Japanese and German delegates being killed, and Japan headed the combined forces of the Powers which marched on the capital for the relief of the legations. The Chinese yielded, asked for peace, punished the leaders of the anti-foreign movement, and agreed to pay a 450,000,000 tael indemnity, and to send delegates to Japan and Germany to make apology.

Anglo-Japanese Alliance After the experience of the North China incident, England abandoned her historical policy of "splendid isolation" and allied with Japan in 1902 for mutual help in the Far Eastern problems. According to the terms of the Alliance, Japan and England were to be united in maintaining Chinese and Korean territorial integrity and to help each other if any two other nations united to attack either one of the allies in the Far East.

Russo-Japanese War

Russia Reluctant to Go Under pressure of the Anglo-Japanese Alliance and the American Government, Russia promised China to return Manchuria, but was by no means ready to keep her promise and on the contrary, in 1903, she sent larger armies to Manchuria and was busy constructing permanent strongholds at Port Arthur, dispatched warships to the port, appointed Alexeiev Governor-General with his headquarters at Port Arthur, acted as the sovereign power in diplomatic, civil and military affairs in the Far East, and in August of the same year invaded the northern part of Korea. This unrestrained Russian advance menaced the territorial integrity of Korea, the existence of Japan, and the peace of the Far East, and Japan was compelled to take a firm stand against these designs, proposing a mutual understanding about the limitations of rights of both nations to avoid the impending danger of collision. But during the course of the negotiations, Russia continued to menace Japan, treating her with contempt and preserving her own aggressive attitude. The Japanese

Digitized by Google

final proposal, on the problems in Manchuria, of the 12th of January, 1904, was left unanswered by Russia for two weeks, and the Imperial declaration of war against Russia was issued on Feb. 10th, 1904.

War on Sea The combined fleet of Admiral Togo immediately attacked the Russian warships off Port Arthur and Chinnampo and constantly pressed the Russian navy in Port Arthur. The warships in Vladivostok often came out into Japanese waters, harassed the communications of the Japanese army on the continent and hindered the transport of soldiers, but they were also destroyed in August by the second squadron under Rear-Admiral Kamimura.

War on Land On the land, General Kuroki headed the First Army and marched into Manchuria through Korea in May; the Second Army of General Oku was landed at the Liaotung peninsula and devising a united stratagem with the Fourth Army of General Notsu defeated the enemy in every place, and the three armies simultaneously advanced to Liaoyang. In June the Emperor ordered Generalissimo Oyama, Commander-in-Chief of all the armies, and General Kodama, Chief of the General Staff, to go to the front, and they spurred the whole army to victory over the Russian soldiers in the town. In October the Russian reinforced armies came down to retake the town, but the Japanese armies encountered them at Shaho and defeated them.

In the meantime the Third Army under General Nogi turned from Liaotung to the attack of Port Arthur. Nogi began the famous but awful siege warfare, and captured the so-called "203-metre hill" in December. In January, 1905, General Stoessel, head of the Russian garrison, surrendered to General Nogi and sued for peace.

After the unsuccessful Battle of Sha-ho the Commander-in-Chief of the Russian army, General Kuropatkin, gathered over 600,000 soldiers at Mukden and awaited his chance. In February, 1905, the Japanese Manchurian armies were reinforced by the Third Army from Port Arthur, and General Kawamura's Yalu River army, and rallying 400,000 soldiers they advanced towards Mukden from three ways. After a fierce battle of 14 days the Japanese armies defeated the immense armies of the enemy, who returned to the north in a complete rout. This momentous event was on the tenth of March, 1905.

The Baltic Fleet Before the downfall of Port Arthur and the defeat at Mukden, Russia had seen the weakness of her naval power in Japanese waters, delaying any possible victory over Japan. She, therefore, had formed the Second and Third Pacific Squadrons out of her Baltic fleet, and had sent them to the Pacific under the leadership of Vice-Admiral Rozdhestvensky. The Russian squadron made a long voyage to the Far East and Togo was able to make full plans to meet them in the most convenient place for the Japanese fleet. Had the Russian warships safely entered the port of Vladivostok the defenceless shores of Japan would have been exposed to their bombardment while the Japanese Manchurian armies might have been starved to death, unable to get supplies from the home Islands. Togo was right when he hoisted high on the main-mast of his flagship the signal, "The fate of Japan will be decided with this battle; every sailor is requested to exert his best for the country," at the moment the outlines of the Russian fleet came into sight. The 38 boats of the two Russian squadrons sailed straight in majestic lines for

Digitized by Google

their destination across the East China Sea. Togo kept the utmost secrecy as to his hiding place and chose the narrow Tsushima Straits to encounter the Russian fleet. It took only a few hours from the evening of the 27th of May to the following morning to sink most of the Russian warships or blow them to pieces, and Rozdhestvensky and his staff were taken captive. In July of the same year a part of the Japanese army was landed at Saghalien and subduing the Russian resistance quickly captured the whole Island.

The Peace Mr. Roosevelt, President of the United States, initiated peace-proposals between Japan and Russia, seeing the disastrous condition, financial or otherwise, which threatened both countries after the battles at Mukden and the Japan Sea. He was successful in pursuading the rival parties to open a peace conference in America. Japan sent Jutaro Komura and Kogoro Takahira as her ambassadors extraordinary and plenipotentiary to Portsmouth, to meet with the Russian ambassadors Witte and Rosen. The peace treaty was concluded in September, 1905. Russia recognized the supreme rights of Japan over Korea, surrendered the southern half of Saghalien to Japan, and handed over the special rights of lease which she possessed in Kwantung, the railroad south of Changchun and the mining of coal along it.

After the Russo-Japanese War

Post-war Readjustment The Russo-Japanese war raised Japan's position in world politics, putting her almost on the same level as the European Powers, especially in regard to Oriental affairs. The international relations of Japan with the Western Powers became so intimate and important that all of them exchanged ambassadors with Japan in place of the former ministers. In home affairs, Japan made special efforts in the education of the people to keep abreast with the times. Industry in all lines leaped forward under the leadership of able business men. The state-ownership of railroads was realized to improve the traffic of the Islands. The patriotic contributions of the business men and merchants after the war must not be overlooked. In 1906 Port Arthur was made a naval station for the defence of the Kwantung littoral, and the South Manchuria Railway Company was established to manage the railroad and mining business which had been handed over by Russia. Dairen and a part of Port Arthur were opened for international trade. In 1907 the Saghalien national boundary was fixed at 50° north latitude, and the Government opened an office there and encouraged the emigration of Japanese to the island.

Relation with Korea

(See Chapter VI.)

Treaties with Powers

(See Chapter VI.)

Demise of the Emperor Meiji In July, 1912, the Emperor Meiji passed away after only a few weeks of illness in his Tokyo Palace. His demise caused such profound grief among the people that an English correspondent was said to have telegraphed home "Japan is going into a decline!" with the death of the great Emperor. He died beloved of all, a love which was attested by the splendid Meiji Shrine which was built in his honour, and which draws more worshipers than any other shrine. The Emperor Yoshihito (the late Emperor Taisho), came to the Throne immediately after his father's death, according to the provisions in the Imperial code on the succession.

Blending of East and West Immedi-

Digitized by Google

ately after the Restoration the Government had been eager to invite and introduce all things Western, and the people had responded to the policy with alacrity. There followed, as a matter of fact, an age of Europeanization. It was during those days that so many Japanese treasures of Buddhism and fine arts went out of the Islands for very meagre amounts of money, and many beautiful old customs and precedents were carelessly dropped. But then came the victories over China and Russia and they gave confidence and conviction to the Japanese and they turned from a mere imitation of the West to the recognition of their own special abilities and valuable inheritances. Cries for the preservation of national characteristics were raised and the blending of the Occidental and Oriental civilizations, the creation of a new Meiji civilization, was started and the nation began to make a steady and healthy advance in all phases of national life.

The World War

Japan's Contribution In August, 1914, the World War broke out and Japan was compelled according to the terms of the Anglo-Japanese Alliance to take necessary steps to combat German activities in the Orient. She requested Germany to withdraw her war vessels from Japanese and Chinese waters, and to return Shantung by a fixed date to China. Needless to say, Germany did not comply, and Japan declared war in the same month.

Tsingtao Falls Japan lost no time in dispatching her army and navy to Tsingtao. The Second Squadron commanded by Vice-Admiral Sadakichi Kato blockaded the gulf while the First Squadron of Tomosaburo Kato kept watch over the Yellow Sea and other Chinese north-eastern seas. The 18th Divisional Commander Kanwo attacked the fortress from behind, in conjunction with the navy. Some British troops also took part and they all besieged the fortress in October, 1914. The attack was so aggressive that in but ten days all the batteries were captured and in November the German Governor Waldeck and his staff surrendered the port and fortress. In deeper waters, the Japanese Third Squadron commanded by Rear-Admiral Tsuchiya kept watch over not only the Chinese seas but also as far as the Philippine waters. A detachment of the First Squadron was sent to the South Seas and acting in concert with the British navy tried to destroy the German Asiatic fleet, the Marshall Islands were occupied in September, and the Mariana and Caroline Islands in October, and possession was taken of all German naval stations in the South Seas. British vessels met the German fleet in the Indian Ocean, and off the coast of South Africa, and destroyed it in December, 1914. With it Germany's strength in the Orient was altogether wiped out.

Japan helped Russia also chiefly by enabling her to attend to the War without any anxiety about Eastern affairs, supplying her with ammunitions as much as she could. Russia was grateful for this friendly attitude of Japan and the relations of the two nations became more intimate, and a new treaty was concluded in 1916 to co-operate for the maintenance of perpetual peace in the Far East, and to negotiate freely with each other for the protection and defence of the special rights and territorial domination already recognized, instead of competing. With the progress of the World War, Japan dispatched a special-service fleet as far as the Mediterranean. The special-service fleet tried their best

Digitized by Google

to protect trade and communications in that part by bravely and effectively attacking German submarines in co-operation with the European fleets and in harmony with the orders of the British Mediterranean fleet Commander. In 1917 the Russian Revolution broke out in the midst of the War. The Romanoff dynasty was overthrown and the radical revolutionaries came into power and concluded peace singly with Germany. This resulted in the permeation of the military influence of Germany and Austria into Russia and even to the Far East. A large body of Czechoslovak troops who had escaped into Russia, and were trying to make their way home to Europe by way of Siberia, suffered greatly in consequence. Japan kept a keen watch on these Russian disorders. In 1918 she sent ships to Vladivostok for the protection of the Japanese residents and to maintain order in that district for the international benefit, in co-operation with the warships of other nations. And later, in agreement with America, Japan dispatched an army under General Otani to Vladivostok and helped the Czecho army, in conjunction with the soldiers of other nations.

Japanese Massacred In March 1920 the Japanese garrison and citizens, about 700 in all, were massacred by Russian communists at Nikolaievsk, which caused intense indignation in Japan. She sent armies to Siberia immediately and occupied a part of the coast district and the remainder of Saghalien. Negotiations were opened again between the two nations and in 1925 a new Russo-Japanese treaty was concluded. According to its terms Japan withdrew her soldiers from North Saghalien while Russia gave Japan the mining rights and freedom of cultivating the oilfields in that district.

The Kanto Earthquake On Sept. 1st, 1923, Japan underwent the sad experience of the Kanto earthquake, in which tens of thousands of houses were destroyed or damaged in Tokyo, Kanagawa, Shizuoka, Saitama and Chiba prefectures, and a hundred thousand people were killed or injured, with an estimated loss of several thousand million yen. (See Chapter I.) The great fires caused by the earthquake in Tokyo and Yokohama caused far more deaths than those which were directly attributable to the shocks. But, undaunted by the terrible disaster, the people not only of the metropolis but of all Japan stood up in a splendid spirit of determination to reconstruct all her damaged cities and towns by the help of the sympathetic nations of America and Europe. The wonderful improvement in the streets and buildings of the new cities materially exhibited the strength of Japan's national power, so that the great earthquake rather quickened than retarded the splendid advance of Japan as a whole.

Demise of the Emperor Taisho In December, 1926, the Emperor Taisho passed away at the Hayama Winter Palace and the Regent, Crown Prince Hirohito, succeeded him as Ruler, the year-name of Showa, or Enlightened Peace, being given to his era. Under his rule Japan is continuing her painstaking efforts to keep pace with the world progress and cope with complicated international relations.

The birth of Manchoukuo in 1932 and the trade and industrial expansion in recent years have greatly strengthened Japan's position in the Orient.

Chronicle of Important Events

Age of Traditions
(660 B.C.–531 A.D.)

1. Beginning of the Empire
   - 660 B.C.—The Emperor Jimmu ascends to the Throne at the Kashiwara Palace, Unebiyama, Yamato province, near the present Nara.
2. Subjugation of Clans and Tribes.
   - 88 B.C. Neighbouring clans subdued by the armies of the Imperial Princes.
   - 11 A.D. The Great Shrine of Isé built by the Emperor Suinin in honour of Amaterasu-Omikami.
   - 97–110 Clans and tribes in Kyushu and the eastern half of the Main Island subdued by the armies of the Emperor Keiko and Prince Yamato-takeru his son.
   - 135 The Emperor Seimu divides his dominion into administrative districts.
3. Intercourse with Korea
   - 200 The Empress Jingo conquers Silla.
   - 285 Confucianism introduced.
   - 313 The Emperor Nintoku establishes the capital at Naniwa (Osaka) for the convenience of intercourse with Korea.
   - 463–512 Troubles with Korea.

Age of Foundation
(532–709)

4. Introduction of Continental civilization
   - 552 Buddhism introduced.
   - 562 Japanese Office in Mimana is destroyed by Silla.
   - 593 Imperial Prince Shotoku becomes Regent, and propagates Buddhism, building Horyuji and other temples.
   - 604 The Regent Shotoku proclaims the Constitution.
   - 607 An Embassy is sent to Sui.
   - 630 An Embassy is sent to Tang.
   - 645 The Sogas punished and extirpated.
   - 592–645 The Asuka or Empress Suiko's Period of Art history.
5. The Taika (Taikwa) Reformation and After.
   - 645 The custom of 'year-names' is introduced, the first one being called Taika (great reformation).
   - 646 The Taika Reformation.
   - 650 Yezo (Hokkaido) is subjugated by the army of Hirafu Abé.
   - 663 Control over the Korean Penisula is abandoned.
   - 701 The Taiho Law is promulgated and the organization of the Imperial Government is fixed.
   - 646–707 The Hakuho Period of Art history.

Nara Age
(710–793)

6. Establishment of the Capital at Nara and Compilation of a History of Japan.
   - 710 The Empress Gemmyo founds Nara as her capital.
   - 620–720 The first books of Japanese history, Nihon Shoki (Japanese Annals and Kojiki (Antiquities) are compiled.
7. Spread of Buddhism and Progress of Religious Fine Art.
   - 747 Building of Todaiji temple and other provincial temples.
   - 756 The Empress Komyo donates the treasures of the late Emperor Shomu to Todaiji temple and they are kept in the Shosoin Museum, built a little later.
   - 769 Dictatorship of Dokyo, Buddhist pope, opposed by the great loyalist Kiyomaro Waké.
   - 710–781 The Tempyo Period of Art history.

Heian Age
(794–1191)

8. Founding of Heian (Kyoto) the Capital, and troubles in the north.
   - 794 The Emperor Kammu founds the new capital Heian and the Government removes there from Nara.
   - 801 Revolts break out in Yezo, finally subduced by the expedition of Tamuramaro Sakanoué.
   - 794–800 Establishment of governmental and private schools.
   - 794–887 The Konin period of Art history.
9. Rising of the Fujiwaras.
   - 858 Yoshifusa Fujiwara assumes the Regency.
   - 887 Mototsuné Fujiwara the Daijo Daijin and Regent becomes Kampaku (Chief Councillor) at the same time.
   - 901 Michizané Sugawara, candidate for Kampaku is reduced to the position of governor of Kyushu by the Fujiwara scandal.
10. Foreign Relations.
    - 894 Official intercourse with Tang is

Digitized by Google

broken off by the advice of Michizané Sugawara.

727-900 Bokkai, a maritime monarchy in Manchuria, trades with Japan.

11. Disorder in Rural Districts and Rise of the Samurai.

939 Masakado Taira rebels and proclaims himself Emperor.

941 Sumitomo Fujiwara disturbs the coasts of the Inland Sea but is suppressed.

960 The Samurai families of Minamoto (Genji) and Taira (Heishi or Heiké) gradually rise to power.

12. Fujiwara Despotism.

1015 Michizané Fujiwara assumes the Regency for the next 20 years and his son Yorimichi for 50 years. Climax of the Fujiwara despotism and prosperity.

13. Incessant Wars.

1019 Toi tribe in the north-eastern part of Korea invades the islands of Iki and Tsushima.

1028 Tadatsuné Taira's treason in Shimoosa province.

1039 Armies of Buddhist monks rise in revolt.

1054–1062 The Abés in the Ohu district declare independence.

1086 The ex-Emperor Shirakawa takes part in politics for nearly 40 years and sets a precedent for government by ex-Emperors.

1085–1087 The Ohu district is again disturbed by the Kiyowaras.

1087 For about a century the family of Kiyohira Fujiwara who subdued the Kiyowaras rules over the Ohu district.

1156 Strife between the armies of the Emperor and the ex-Emperor (Hogén war).

1159 The Fujiwaras and Minamotos wage war against another branch of the Fujiwaras and the Tairas (Heiji war).

14. The Gen-pei (Minamoto and Taira) Period.

1167 Kiyomori Taira promoted to Daijo Daijin.

1167–1180 Autocracy of Kiyomori and his family.

1180 Rise of the Minamotos in rivalry to the Tairas. Yoritomo Minamoto establishes headquarters at Kamakura.

1185. The Tairas destroyed by the armies of Yoshitsuné, brother of Yoritomo.

1185 Yoritomo appoints local military police and tax-gatherers for rural districts.

989–1185 The Fujiwara Period of Art history.

Kamakura Age
(1192–1337)

15. Beginning of the Kamakura Shogunate Régime.

1192 Yoritomo Minamoto promoted to Seii-Tai-Shogun (Generalissimo) and the Shogun Government formally sanctioned. For the next 675 years Japan ruled by the 'samurai statesmen'.

1204 Tokimasa Hojo becomes chief executive of the Shogunate régime.

1219 Minamoto Shogunate ends with the third Shogun, Sanétomo. But Masako, widow of Yoritomo, (called the 'Ama' or Nun Shogun) officiates as Shogun for several years.

1221 Trouble between the Kyoto Court and the Hojos (Shokyu affair).

16. Hojo Rule.

1224 Yasutoki Hojo becomes chief executive of the Kamakura Shogunate.

The Hojos continue to exercise the Shogun's duties for over a century.

1232 The Joyei Code promulgated for the discipline of the samurai.

1274 Yuan invasion.

1281 Second Yuan invasion and defeat by the armies of Tokimuné Hojo, the chief executive.

1324 An attempt for the restoration of the Imperial Rule.

1331 War between the Imperial and the Hojo armies.

1333 The Hojos destroyed.

17. The Emperor Godaigo and Takauji Ashikaga

1333 Temporary restoration of the Imperial direct rule by the Emperor Godaigo.

1335 Takauji Ashikaga rebels against the Emperor.

1336 Masashigé Kusunoki, famous loyalist, dies in the battle of Minatogawa (Kobé).

1336 The Emperor Godaigo moves to Yoshino mountain.

1336 The Imperial House is divided into two, the South and the North (Yoshino and Kyoto) for 57 years.

1192–1337 The Kamakura period of Art history.

Muromachi Age
(1338–1602)

18. Beginning of the Muromachi Shogunate and the luxurious age of Yoshimitsu.

1338 Takauji Ashikaga proclaims him-

Digitized by Google

self Shogun and establishes the Muromachi Shogunate in Kyoto.

1342 Takauji sends the Tenryuji-buné (trade boats) to China.

1368 Yoshimitsu Ashikaga is publicly appointed Shogun and the Muromachi Shogunate officially sanctioned.

1399 The Oei Rebellion.

1401 Yoshimitsu trades with Ming: indulges in luxurious living.

19. Corruption of the Muromachi Shogunate and Political Commotion

1438 The Yeikyo Rebellion. Rising of military lords in Kanto district.

1441 The Kaki Rebellion.

1467-1475 The Ohnin war: Kyoto is reduced to ashes in the street fighting. The Court and the Shogunate both lose power and the whole country becomes a scene of warfare among the military lords.

20. A century of civil wars among the feudal lords.

1491 Soun Hojo captures Odawara Castle and rules over the Kanto district.

1476-1573 Feudal lords struggle for supremacy, the greater lords being as follows: Kanto district; Hojo, Uesugi. Ohu district; Daté, Ashina, Mogami, Tamba, Akita. Central district; Uesugi, Takeda, Imagawa. Kinki (Kyoto-Osaka) district; Saito, Asai, Asakura, Oda, Matsudaira. Chugoku (Western Main Island) district; Ukida, Amako, Ohuchi, Mōri. Shikoku Island; Miyoshi, Kōno, Chōsokabé. Kyushu Island; Otomo, Ryuzoji, Shimazu.

1543 Coming of the Portuguese.

1543 Introduction of fire-arms.

1549 Christianity introduced.

1337-1573 The Muromachi Period of Art history.

21. The Oda and Toyotomi Period.

1568 Nobunaga Oda comes up to Kyoto by Imperial order and repairs the Palace.

1571 Nobunaga destroys Enryakuji temple to suppress the power of the monks.

1573 Downfall of the Muromachi Shogunate.

1576 Building of the Azuchi castle.

1582 Nobunaga assassinated.

1582 Hideyoshi Toyotomi's supremacy.

1588 Hideyoshi is promoted to be Kampaku and Daijo Daijin.

1590 Unity of the Empire is realized by Hideyoshi, all the lords being completely subdued.

1592 Invasion of Korea by armies of Toyotomi.

1597 Second invasion of Korea.

1598 Hideyoshi Toyotomi dies at Fushimi castle (Momoyama Palace).

1574-1598 The Momoyama period of Art history.

Yédo Age
(1602–1867)

22. Beginning of the Tokugawa Shogunate.

1600 Battle of Sekigahara, assuring the supremacy of Iyeyasu Tokugawa (1542–1616)

1603 Iyeyasu is appointed Shogun and founds the Yedo Shogunate.

1609 Begins trade with Hollanders.

1609 The Loochoo Islands subjugated by Lord Shimazu.

1610 Sending of official letters to Nova-Hispania and Spain.

1612 Iyeyasu prohibits the preaching of the Catholic Faith.

1613 The lord Masamuné Daté sends Hasekura to Rome.

1613 Opens trade with the English.

1615 The Toyotomis are destroyed at the Battle of Osaka.

23. Stabilization of the Yedo Shogunate.

1615 Proclamation of the Kugé Hatto (Court Nobles Law) and the Buké Hatto (Samurai Law).

1616 Death of Iyeyasu.

1623 Iyemitsu (1604–1651) becomes the third Tokugawa Shogun. Under his enlightened rule the position of the Yedo Shogunate becomes unshakable.

1630 Introduction of Western literature prohibited.

1636 Japanese forbidden to go abroad.

1637-1638 The Shimabara Rebellion.

1651 Death of Iyemitsu and attempted rebellion by Yuino Shosetsu and his colleagues.

24. The Golden Age of the Yedo Shogunate.

1657 Mitsukuni Tokugawa, lord of Mito begins the compilation of the Dai Nippon Shi (Great Nippon History).

1687 The Shogun Tsunayoshi's Edicts for the protection of animals cause much loss of human life.

1688-1709 The Genroku Era of luxurious living.

1702 Revenge of the '47 Akao Ronin'

1709 Hakuseki (Kunmi) Arai's Reformation.

1716 The 8th Shogun Yoshimuné regulates officialdom and improves the administration, reigning for 30 years.

Digitized by Google

1720 Yoshimuné loosens the Prohibition Law against Western books.
1759 Punishment of Takenouchi Shikibu, a loyalist.
1764 Norinaga Motoori commences his commentary on the Kojiki (Antiquities).
1772-1784 Misrule of the Roju Okitsugu Tanuma.
Succession of natural calamities.
1787 Adjustment of the administration by the Roju Sadanobu Matsudaira (Rakuo).

25. Waning of the Shogun Régime.
1792 Punishment of Shihei Rin (Hayashi) who warned the Government of possible invasion by foreign Powers.
1792 Coming of Laxsman to Hokkaido.
1804 Coming of Lesanov to Nagasaki.
1808 Coming of an English boat to Nagasaki.
1825 Shogunate order to shut out all foreign ships by force.
1830 Great famine of the Tempo Era.
1837 Rebellion of Heihachiro Oshio to relieve the starving masses.
1837 Coming of the American ship Morrison.
1841 The Roju Tadakuni Mizuno's attempt at reformation.
1842 The 1825 order is removed. A step towards the 'open door' policy.
1842 Controversies between the anti-foreign party and the liberalists become hotter.
1844 King of Holland gives advice to the Shogunate.
1846 First request of America for the 'open door.'
1853 Arrival of the American fleet under Commodore Perry.
1853 Coming of the Russian delegate Poutiatine to Nagasaki.
1854 Institution of the Sun Flag to symbolize Japan. (Sanctioned by the Meiji Government in 1870.)
1854 Conclusion of Amity Treaties with America, England and Russia.
1855 Conclusion of Amity Treaty with Holland.
1856 Arrival of the American envoy Townsend Harris.
1858 Conclusion of Commercial Treaties with Foreign nations by the Shogunate.
1858 The Ansei Coup d'état by the Tairo Naosuké Ii.
1860 The Japanese envoy Masaoki Niimi sent to America.
1860 The Tairo Ii assassinated at the Sakurada gate of the Shogun Palace.

26. Downfall of the Yedo Shogunate.
1862 Rise of the Anti-Shogunate movement.
1862 The Namamugi Affair.
1863 The Anti-Foreign Law, and attack on foreign ships at Shimonoseki and Kagoshima.
1863 Defeat of the Anti-Foreign party; the seven Court nobles flee to Nagato.
1864 The Anti-Foreign party demands the release of the seven Court nobles by force; battle at the Hamaguri gate of the Kyoto Imperial Palace.
1864 A combined fleet of America, England, France and the Netherlands bombards Shimonoseki.
1865 Imperial Sanction given to the treaties of 1858.
1865-1867 Hostilities between the Shogunate forces and the army of the Choshu (Nagato) Lord who represented the Anti-Shogunate and Anti-Foreign Party.
1866 Demise of the Emperor Kōmei.
1867 Ascension of the Meiji Tenno (1852-1912), the 122nd Emperor.
1867 The Emperor orders armies opposed to the Nagato Lord to withdraw.
1867 Rapid progress of Anti-Shogunate movement and a definite scheme promoted by Sanjo, Iwakura, Saigo, Okubo, and Kido.
1867 The Emperor gives orders to the lords of Nagato and Satsuma to move their armies against the Yedo Shogunate in compliance with the request of Sanjo, Iwakura and their colleagues, October 14.
1867 On the same day (October 14) the Shogun Yoshinobu Tokugawa asks Imperial sanction for the return of all authority of the Government to the Throne. On October 24 the Emperor complies with his request and accepts Yoshinobu's resignation.
1867 Proclamation of the Restoration, December 9.
1868 The rise of the lords and warriors loyal to the Shogunate. Battle of Toba-Fushimi. March of the Imperial armies to Yedo. Surrender of the Yedo Castle without bloodshed. Battles at Uéno, Utsunomiya and Aizu.
1869 Battle at Hakodaté, May, after which all disturbances in the wake of the political change are completely subdued.
1602-1867 The Yedo period of Art history.

CHAPTER IV

GOVERNMENT

The Constitution

The fundamental source of all laws and ordinances, and of the administrative system is the Constitution of the Japanese Empire. This document, however, contains simply an outline of the principles involved, and there are many constitutional laws, written and unwritten, which condition the functioning of state organs. There are four fundamental sources of the laws of Japan; (1) the Constitution, (2) the Imperial House Law, (3) certain laws containing constitutional provisions, and (4) the unwritten constitution.

The Constitution of the Japanese Empire was promulgated on Feb. 11, 1889, and is composed of 7 chapters and 76 articles (given in full in Appendix). It was accompanied by an Imperial Declaration, the essence of which has the same legal force as the articles of the Constitution. In the declaration, the Emperor Meiji made four points clear: that the purpose of the establishment of the Constitution is to promote the welfare of his subjects and sustain the progress of the nation; secondly, that the monarchy of Japan is unchanged in form and identical with what it has always been, in the principles of the harmonious rule of sovereign and subjects and of constitutional and responsible government; thirdly, the proper means for revision of the Constitution, and that it limits not only the lawful actions of the subjects, but also the powers of the sovereign; and fourthly, the date of its coming into effect, that of the opening of the first session of the Imperial Diet or November 25, 1890.

The Highest Expression of State Will The Constitution was given by order of the Emperor and is the highest expression of the will of the State. All laws must conform to it, while the functions of the highest political organs of the nation are stated in it. But there is no means specified for prevention or correction of a breach of the Constitution by those organs, whether they be constitutionally established or not, except in so far as the interpretative power of the Privy Council, (see section on Privy Council), can be said to constitute such a check. Otherwise, this can only be provided for by the reciprocal restraint exercised by the Executive and the Legislative, the power of public opinion, or other means which are not specified by law. It must be remembered that not all the parts of the Constitution are new creations. Most of them are rather the expression of old laws in a new written form; many of the important political customs had already been incorporated in legal enactments before the Constitution came into being.

The Constitution does not include the whole of constitutional laws. It is one of the simplest constitutions in the world. For instance, such laws as the Imperial House Law or the laws concerning the composition of the Imperial Diet are not included in the Constitution, the reason being that, whereas the revision of these laws in accordance with changes in public thought may be necessary, it is undesirable that the

Digitized by Google

Constitution itself should be revised easily and often. Revision of the Constitution must be initiated by the Tenno (Emperor), and the Imperial Diet has the power of deciding only on such revisions as are indicated by the Throne. No revisions have been made or constitutionally suggested since its establishment.

Other Constitutional Provisions The Imperial Household Law (See Appendix) mainly regulates matters concerning the Imperial household and family, but there are many constitutional provisions contained in it. Of special importance are the articles concerning the succession of the Throne and Regency, which determine the form of the highest organ of the State and are therefore clearly of equal importance to the Constitution itself.

Other legal enactments containing constitutional provisions are the following: The Law of the Houses, the Imperial Ordinance concerning the House of Peers, the Imperial Ordinance concerning the Election of Members of the House of Peers, the Imperial Ordinance concerning the Cabinet, the Penal Law concerning the infringement of Ordinances, the Judicial Court Formation Law, the Court of Administrative Litigation Law, and the Board of Audit Law, which were enacted simultaneously with the Constitution; the Imperial Ordinances concerning the Privy Council and the Military Establishments, which were enacted before the promulgation of the Constitution; the Electoral Law and the common law for the formation of departments of the central government, which were promulgated after the Constitution. In addition there are many examples of post-Constitution laws with minor constitutional provisions.

Unwritten Provisions The Constitution of Japan is a written one in principle, but it does not exclude all unwritten provisions. There are still some spheres of government action which are not regulated by any document. Moreover, there are many cases in which the written laws have to be interpreted by unwritten laws or by national political custom or reason. For instance, the relation of the Japanese nation to the Shinto Shrines, the relation of State and religion, the site of the capital, the nature of the National Flag, the Calendar, and the customary procedure of the Imperial Diet are not defined in written laws, but are nevertheless constitutional observances. Other political customary observances of importance are that the Cabinet is formed, as a rule, by the members of the majority party in the House of Representatives, and that the Genro, Elder Statesmen, (at present only one, Prince Saionji) are consulted by the Emperor on the choice of a new Prime Minister.

The Form of Government

The form of the Japanese Government is that of a constitutional monarchy. The Empire is ruled by the Emperor (Tenno) according to the first article of the Constitution, "the Empire of Japan shall be reigned over and governed by a line of Emperors unbroken for ages eternal." The representatives of the people in the Imperial Diet participate in the rule of the State, but have no sovereign power. Sovereignty belongs entirely to the Emperor and all power is exercised in his name only. The Japanese Reigning House is the oldest dynasty in the world and, in stability and historical continuity, the Japanese monarchy is unique in history. The actual power of the Emperor at the present time is much greater than that of other constitutional monarchs.

Digitized by Google

The actions of all governmental organs are regulated by the Constitution and the collateral laws and usages above mentioned, and all the organs are co-ordinated by the central government. The supreme power is concentrated in the State, and the exercise of sovereignty is all in the hands of the central government which gives orders to all other administrative organs.

The People

All Japanese subjects are registered with the census authorities according to the Law of Nationality, and are recognized as the constituency of the state and protected by the state laws. They are required to submit completely to the control and orders of the state. By the terms of the Constitution they may, subject to qualifications determined by law or ordinance, be appointed to civil or military offices equally and may fill any other public positions. They are liable to service in the army and navy and to the duty of paying taxes according to the provisions of law. The duties they owe to the State are numerous, but these two are specially mentioned in the Constitution.

Japanese subjects are guaranteed liberty of abode and of changing the same. Within the limits of law, they shall not be arrested, detained, tried, or punished unless according to law, shall not be deprived of their right of being tried by the judges determined by law, except in cases provided for by the law, their houses shall not be entered or searched without their consent, the secrecy of their letters shall remain inviolate, and their right of property shall remain inviolate. They enjoy freedom of religious belief, speech, writing, publication, public meeting and association; and they may present petitions to the authorities in the forms provided by law.

The feudal social castes were abolished at the Meiji Restoration, and the class names of Kazoku (Peers), Shizoku (Samurai class), and Heimin (Common people) were given according to family standing and lineage. The two last are purely social and represent no political distinction. Peerage carries with it the privilege of membership of the Upper House of the Legislature (Kizokuin, House of Peers), subject to certain conditions. In 1884 the peerage was divided into the following five ranks: Prince, Marquis, Count, Viscount, and Baron. The class name of "Common people" has fallen into complete disuse, while that of "Samurai class" is being rapidly forgotten.

Tenno, The Emperor

The Japanese Throne is hereditary. The custom was established with the foundation of the State 2,593 years ago, and had been a constitutional unwritten law till it was clearly stated in the Imperial House Law by order of the Emperor Meiji. According to this law, the Japanese Throne "shall be succeeded to by male descendants in the male line of Imperial Ancestors" (Art. 1). In the history of Japan there were some Empresses in their own right, but their cases were always regarded as exceptional. The succession to the Throne as defined by the Imperial House Law is as follows:

(1) Imperial eldest son. (Kotaishi)

(2) Imperial eldest grandson. (Kotaison)

(3) Other male descendants of eldest son.

(4) Imperial son next in age.

(5) Male descendants of same in the same order as above.

Digitized by Google

(6) Other Imperial sons in order of age.

(7) Male descendants of same in the same order as above.

(8) Imperial brothers in order of age and their male descendants in the same order as shown in the above.

(9) Imperial uncles and their male descendants in the same order as above.

(10) Next nearest relative of the Emperor.

In all cases precedence is given to descendants of full blood over those of half blood.

The Three Sacred Treasures The Imperial heir ascends the Throne and is invested with the three Sacred Treasures, the Mirror, the Jewel, and the Sword, of the Imperial Ancestors upon the demise of the Emperor, and in no other circumstances. In ancient days, the Throne was succeeded to only for this natural reason, but the good custom was broken in the middle ages. The Imperial House Law aims at the re-establishment of the oldest custom and absolutely prohibits the abdication of the Throne in the Emperor's life time. The Imperial heir ascends to the Throne immediately upon the demise of the Emperor, although the ceremonial ascension comes later. For instance, the present Emperor came to the Throne in a room of the Hayama Winter Palace, where his father died, immediately after the demise was announced by the doctor on December 25, 1926, while the formal ceremony of ascension was held about two years later in accordance with Art. 11 of the Imperial House Law which states that the ceremonies of Enthronement shall be performed and a Grand Enthronement Banquet (Daijo-sai) in honour of the Ancestral Gods held at Kyoto. Upon the ascension, a new era is inaugurated and the name of the era remains unchanged during the whole reign of the Emperor.

The Regency As abdication of the Throne is impossible, Art. 19 of the Law provides for a regency to be instituted, when the Emperor is a minor (the Tenno, Kotaishi and Kotaison attain majority at 18 years of age) or when he is prevented by some permanent cause from personally governing. In the second case the advice of the Imperial Family Council and of the Privy Council is required. The Regency shall be assumed by major members of the Imperial Family in the following order:

Family Status	Majority Age
(1) The Imperial Eldest son	18
(2) Imperial Eldest Grandson	"
(3) Imperial Prince	20
(4) Prince	"
(5) The Empress	"
(6) The Empress Dowager	"
(7) The Grand Empress Dowager	"
(8) Imperial Princess or Princess	"

Imperial Prerogative

According to the provisions of the Constitution, the Japanese Emperor is the head of the Empire, combining in himself all the rights of sovereignty. According to the provisions of the Imperial House Law, he is the head of the Imperial Family, and he carries out his function as such by the advice of the Minister of the Imperial Household without reference to the Diet. By hereditary custom he assumes the position of the Highest Priest of the national cult of Shinto and conducts august ceremonies in honour of the gods of heaven and earth and of the ancestral gods directly and in person. He is in supreme

Digitized by Google

command of the Imperial Army and Navy and exercises this power with the help of special organs established to that end and independently of the advice of State ministers. Lastly, he has power to confer all titles of nobility, rank, orders and other marks of honour.

The Emperor uses these sovereign powers with the assistance of various organs. In exercising legislative power he gets the consent of the Imperial Diet as a rule, although Imperial ordinances are often issued independent of the Diet, (under Article 9 of the Constitution), and for the colonies the exercise of ordinance power is unlimited by the Constitution. In the administration of State affairs he is advised by the Ministers of State, and in certain special cases by the Genro, the Keeper of the Privy Seal, and the Privy Council. In Military administration he is advised by the chiefs of the Naval and Military General Staffs, while in the exercise of judicial power, he is represented by the Courts of Law.

"The Emperor is sacred and inviolable" (Constitution, Art. 3). He cannot be removed from the Throne for any reason; and he is not to be held responsible for overstepping the limitations of law in the exercise of his sovereignty. All responsibility for the exercise of his sovereignty must be assumed by the Ministers of State and other organs. Thus, no criticism can be directed against the Emperor, but only against the instruments of his sovereignty. Laws are not to be applied to the Emperor as a principle, especially criminal laws, for no court of law can try the Emperor himself and he is not subject to any law.

The Cabinet

The Ministry is composed of 13 State ministers headed by the Prime Minister. The twelve ministers are (1) the Minister of Foreign Affairs, (2) the Minister of Home Affairs, (3) the Minister of Finance, (4) the Minister of War, (5) the Minister of Marine, (6) the Minister of Justice, (7) the Minister of Education, (8) the Minister of Agriculture and Forestry, (9) the Minister of Commerce and Industry, (10) the Minister of Communications, (11) the Minister of Railways, and (12) the Minister of Overseas Affairs.

Though all the ministers are separately responsible to the Emperor for all the administrative work under their respective jurisdiction, they are united by the Prime Minister (Naikaku Sori Daijin), one of whose functions is to preserve unity among the State ministers. Through this specific function of the Premier (which, though not mentioned in the Constitution, is prescribed in the Cabinet Organization Ordinance), and the rapid growth of party government, his controlling power over the other state ministers has, of late, been greatly augmented, and as all matters of national importance are decided upon in cabinet meetings, State ministers are now, as a matter of fact, held jointly responsible to the Emperor.

Thus, each departmental minister has a twofold function, first as a state minister and secondly as a departmental executive head. As a State minister he is an adviser to the Emperor in the exercise of his sovereign power over national administration, and for the advice given assumes a joint responsibility with his colleagues. As a departmental head his function is to direct, control and supervise all the administrative affairs within his departmental jurisdiction, for which his responsibility is individual.

The Present Cabinet Prime Minis-

Cabinet Bureaux

Important offices of the Cabinet are the Secretariat, Pension Bureau, Statistics Bureau, and Printing Bureau. There are three other bureaux which are affiliated to the Cabinet and which are under the Premier's direct control, namely the Legislation Bureau, Merit Bureau and Resources Bureau. All bills to be submitted to the legislature by the Government and all ordinances to be promulgated are drafted at the Legislation Bureau in accordance with the order of the Premier. Proposals of amendment or repeal of laws or ordinances are also submitted to this bureau. In the discharge of his duties the Chief of the Legislation Bureau is at liberty to present his opinion to the Cabinet.

The Merit Bureau handles all business pertaining to the Order of Merit, decoration and the pension affiliated to it, national and international. The Resources Bureau supervises all the matters concerning the planning, utilization, and administration of the national resources, human and material.

On December 26, 1934, the Bureau for Manchurian Affairs was established. The bureau is under the Premier's direct control as the other three bureaux. Its function is to supervise all matters concerning Kwantung Leased Territory and the South Manchuria Railway Zone through the Kwanto Bureau in the Japanese Embassy in Hsinking.

There are the following committees under the direct control of the Premier:—(a) The Higher Civil Service Examination Committee which is in charge of the higher civil service examinations, and of recommendations to certain higher posts. It consists of 8 members who are chosen from among high officials of the Government and its chairman is the Chief of the Legislation Bureau. (b) The Central Statistics Committee, (c) the Pensions Arbitration Committee, (d) the Educational Investigation Committee, which investigates and deliberates on educational problems of national importance. It consists of 53 members including the president and two vice-presidents. (e) The Resource Investigation Committee, (f) the Rice and Cereals Investigation Committee, (g) the Investigation Committee for the Correction of Election Evils, (h) the Temporary Industrial Investigation Committee, and (i) the Temporary Administrative and Financial Investigation Committee.

On May 10, 1935, (Imperial Ordinance, No. 118) the Naikaku Shingikai or Cabinet Advisory Board was established. The function of the board is to make investigations and find out conclusions on important national policies upon the request of the Cabinet or may present views on such policies to the Cabinet on its own initiative. The board consists of the president, the vice-president and 15 members. The chairs of the president and the vice-president are taken by the Premier and a member of the Cabinet respectively. Fifteen members are chosen, by the Imperial order, from among experienced statesmen or citizens.

Cabinet Bureaux

Important offices of the Cabinet are the Secretariat, Pension Bureau, Statistics Bureau, and Printing Bureau. There are three other bureaux which are affiliated to the Cabinet and which are under the Premier's direct control, namely the Legislation Bureau, Merit Bureau and Resources Bureau. All bills to be submitted to the legislature by the Government and all ordinances to be promulgated are drafted at the Legislation Bureau in accordance with the order of the Premier. Proposals of amendment or repeal of laws or ordinances are also submitted to this bureau. In the discharge of his duties the Chief of the Legislation Bureau is at liberty to present his opinion to the Cabinet.

The Merit Bureau handles all business pertaining to the Order of Merit, decoration and the pension affiliated to it, national and international. The Resources Bureau supervises all the matters concerning the planning, utilization, and administration of the national resources, human and material.

On December 26, 1934, the Bureau for Manchurian Affairs was established. The bureau is under the Premier's direct control as the other three bureaux. Its function is to supervise all matters concerning Kwantung Leased Territory and the South Manchuria Railway Zone through the Kwanto Bureau in the Japanese Embassy in Heinking.

There are the following committees under the direct control of the Premier :—(a) The Higher Civil Service Examination Committee which is in charge of the higher civil service examinations, and of recommendations to certain higher posts. It consists of 8 members who are chosen from among high officials of the Government and its chairman is the Chief of the Legislation Bureau. (b) The Central Statistics Committee, (c) the Pensions Arbitration Committee, (d) the Educational Investigation Committee, which investigates and deliberates on educational problems of national importance. It consists of 53 members including the president and two vice-presidents. (e) The Resource Investigation Committee, (f) the Rice and Cereals Investigation Committee, (g) the Investigation Committee for the Correction of Election Evils, (h) the Temporary Industrial Investigation Committee, and (i) the Temporary Administrative and Financial Investigation Committee.

On May 10, 1935, (Imperial Ordinance, No. 118) the Naikaku Shingikai or Cabinet Advisory Board was established. The function of the board is to make investigations and find out conclusions on important national policies upon the request of the Cabinet or may present views on such policies to the Cabinet on its own initiative. The board consists of the president, the vice-president and 15 members. The chairs of the president and the vice-president are taken by the Premier and a member of the Cabinet respectively. Fifteen members are chosen, by the Imperial order, from among experienced statesmen or citizens.

Digitized by Google

On the same date (Imperial Ordinance, No. 119) the Cabinet Investigation Bureau was established to make investigations on important national policies and to handle matters in connection with the working of the Cabinet Advisory Board. The bureau is under the direct control of the Prime Minister and consists of 37 officials beside the director.

The Executive Departments

Department of Foreign Affairs The Minister of Foreign Affairs administers all the diplomatic affairs of the Empire; organizes the protection of the Empire's commercial interests and resident Japanese subjects in foreign countries; and directs and supervises Japanese diplomats and consuls. The Department of Foreign Affairs is subdivided into five bureaux, namely, (1) East Asiatic, (2) European and Asiatic, (3) American, (4) Commercial, and (5) Treaties.

The East Asiatic Bureau is divided into three sections; The First Section handles diplomatic matters related to China, HongKong and Macao; the Second Section those concerning Siam and protection and control of Japanese residences in those countries; and the Third Section those concerning Manchoukuo.

The European and Asiatic Bureau is divided into two sections; the First Section handles diplomatic matters related to the U.S.S.R., Finland, Estonia, Latvia, Listhuania, Turkey, Poland, Persia and Afghanistan; the Second Section those of all the European and other countries not coming under the control of any other bureau or section.

The American Bureau is divided into three sections; the First Section handles diplomatic matters concerning Canada, the United States of America and her territories; the Second Section, the Central and South American countries; the Third Section handles matters concerning emigrants and passports.

The Commercial Bureau is divided into three sections; the First Section handles matters concerning institutions and policies of trade and navigation; the Second Section control, promotion and protection of trade and navigation; the Third Section commercial affairs and reports.

The Bureau of Treaties is divided into three sections; the First Section handles matters concerning drafting, interpretation, sanction, publication and revision of treaties with foreign countries; the Second Section international judicial matters; the Third Section the League of Nations.

There are other three offices of importance. The Information Bureau is divided into three sections. The First Section handles matters concerning news in daily papers and broadcasting; the Second Section books, magazines, publication, foreign news agencies, propaganda, international meetings; the Third Section distribution of diplomatic knowledge.

The Investigation Bureau is divided into five sections and their duties are as follows; The First Section general business and study of diplomatic facts; the Second Section keeping of records and materials; the Third Section investigations on diplomatic and commercial situations in Asia and the Near East; the Fourth Section investigations on Europe and Oceania; the Fifth Section political and diplomatic investigations on North and South American countries.

The Cultural Works Bureau handles matters concerning the cultural works for China which mainly consist of promotion and assistance of cultural investigations and enterprises on China.

Portugal	Lisbon
Siam	Bangkok
Mexico	Mexico
Argentine	Buenos Aires
Chile	Santiago
Peru	Lima
Cuba	Havana
Colombia	Bogota

(The list of the envoys to and from foreign countries is given in Chapter VI with the full addresses of embassies and legations.)

Department of Home Affairs The Minister of Home Affairs is in charge of national shrines, prefectural administration, national and local political elections, police, public undertakings, public health, town planning, publication and copyrights, etc. It is also his function to supervise the Chief of the Metropolitan Police Board and the prefectural governors. The Ministry of Home Affairs has in recent years become the most important Government office politically, inasmuch as it supervises elections and administers local public works. The Minister is assisted by a parliamentary vice-minister, a vice-minister and a counsellor. The department has five bureaux, respectively in charge of the following affairs :— (1) Shrines, (2) Local Affairs, (3) Public Order, (4) Public Works and (5) Public Hygiene. The Bureau of Social Affairs is affiliated to the Ministry and responsible to the Minister.

The Bureau of Local Affairs has a vast field to supervise. It has to be in close touch with (1) all matters affecting elections, (2) all the work concerning local public associations and other general administration, (3) financial and economic matters of various local public associations, (4) all matters concerning conscription and requisition to be executed by the prefectural governments, (5) all matters concerning forests, reclamation and settlement in Hokkaido and other matters in Hokkaido which do not come within the scope of any other bureaux.

The Bureau of Public Order is the depository of the highest authority over ordinary as well as political police matters, and the publication of books and other printed matter.

The Bureau of Public Works is in charge of all public undertakings, not only those under the direct control of the Home Department but also those of all the prefectural governments. All matters regarding the expenditure for public works of all sorts directly undertaken by the Department of Home Affairs and the subsidies to be granted for prefectural public works are handled by this Bureau.

The Bureau of Public Hygiene is in charge of measures for the prevention of the spread of epidemics. The Bureau is also in charge of quarantine work, and supervises the medical, pharmaceutical and dental

Digitized by Google

professions, including the issue of licences to practice, and the sale of medical goods. All matters concerning hygienic associations and local hospitals come also under the supervision of this Bureau.

The Bureau of Social Affairs handles all matters concerning :— (1) labour, (2) enforcement of the factory law, (3) miners, as prescribed in the mining law, (4) application of the minimum-age-for-factory-employment law, (5) arbitration of labour disputes, (6) social insurance, (7) the prevention of unemployment and relief of the unemployed, (8) international labour arrangements, (9) protection of children, (10) military relief work, and (11) other social works.

The Department of Home Affairs has the following other bureaux under its control :— (a) The Reconstruction Bureau, which is still working for the improvement of the streets and buildings of Tokyo and Yokohama as part of the plan of reconstruction of the cities damaged by the Great Earthquake of 1923. (b) The Japanese section of the International Labour Office, which is located at Geneva for the management of international activities of labour organs of Japan. (c) The Labour Exchange Bureau, which handles matters pertaining to the unity and interrelation of the work of labour exchanges throughout the country.

The following institutions also come under the control of the Minister of Home Affairs :— the Asylum for Disabled Soldiers, the National Shrines Building Office, the Police Educational Institute, the National House of Correction for the Improvement of the Juvenile Criminals, the Hygiene Laboratory, the Aliment Investigation Laboratory and the National Leper-House. Twelve special committees advise the Minister on the following matters, respectively :— (1) Investigation of a Proper System of Shinto Shrines, (2) Examination of Medical Practitioners, (3) Examination of Dentists, (4) Examination of Pharmacists, (5) Central Hygiene, (6) Sanitary Investigation, (7) Town Planning, (8) Labour Insurance, (9) Labour Exchanges, (10) Unemployment Prevention, and (11) Opium.

The Department of Finance The Minister of Finance is in charge of accounting, payments and receipts of public money, taxation, government bonds, coins, money in deposit and custody, negotiable instruments owned by or in custody of the Government and all matters concerning banking, trust business, "ko" (an oriental mutual loan association), and sale of negotiable instruments. He also supervises the finances of prefectural governments and other local public bodies.

The Finance Department has the following four bureaux :— (1) The Accounts Bureau, which handles all matters concerning the national budget and settlement of accounts, special accounts, co-ordination of treasury business, control of accounting officials, etc. (2) The Bureau of Taxation, which handles matters pertaining to the levying of national taxes, supervision of taxation business, the land register, and customs and excise tariffs. (3) The Bureau of Fund Employment, which is in charge of matters concerning the employment of national funds, the administration of national treasury money, the coinage, general circulation of money, national loans, accident and relief funds, deposits and negotiable securities, annuities, and public loans floated by public associations. (4) The Banking Bureau, which takes charge of matters concerning special, ordinary and savings banks, other matters pertaining to banks, the central chest

Digitized by Google

of the industrial unions and credit unions in the cities.

The following other bureaux and institutions are attached to the Department of Finance and under the direct jurisdiction of the Minister :— (1) The Deposits Bureau, which handles a huge amount of deposits from the middle and lower classes of the people, special importance being always attached to the question of how to utilize this money. (2) The National Property Bureau, which is in charge of all national properties, and makes arrangements for their disposal or acquirement. (3) The Mint Bureau, located in Osaka, which is in charge of the minting and melting down of all coins, the casting of national medals or decorations, and laboratory work on metals. (4) The Customs Bureau, which not only handles matters concerning the collection of import duties but also takes charge of the control of ships going in and out of the trade ports, examination of the health of passengers, plants and animals, and registration of epidemics in accordance with the epidemics or tuberculosis prevention laws for men and animals. Custom Houses under this Bureau are located at the six trade ports, namely, Yokohama, Kobé, Osaka, Nagasaki, Moji and Hakodaté. (5) The Revenue Superintending Bureau, which handles matters concerning tax collection. (6) The Monopoly Bureau, which administers the three government monopolies, salt, camphor and tobacco.

One laboratory and 7 committees are under the direct control of the Minister of Finance, namely, the Brewing Laboratory and the Committees on Tariff Petition Examination, the National Property Survey, Grants of National land to Buddhist Temples (temporary), Building Central Offices of the Government, Tariff Investigation, Special Accommodation for the examination of the matters pertaining to the grant of special accommodation to the Bank of Japan, and Special Accommodation Loss Examination.

The Department of War The function of the Minister of War is to direct the military administration. He controls all the men enlisted in the Army and supervises all branches of the Army. Though the War Minister is assisted by a parliamentary vice-minister and a counsellor they have nothing to do officially with military secrets and military orders (for the organization of the Department and its detailed functions, see Chapter VII).

The Department of Marine The Minister of Marine is responsible for all naval administration. He controls all the men enlisted in the Navy and supervises all branches of the Navy. The parliamentary vice-minister and counseller have nothing to do with the naval secrets and naval commands (for the organization of the Department and its detailed functions, see Chapter VII).

The Department of Justice The Minister of Justice supervises courts and procurators' offices ; and controls all judicial proceedings. The Department contains three bureaux, dealing respectively with civil affairs, criminal affairs, and prisons.

Judicial procedure is divided into three instances. The courts of first instance are the District and Local Courts. In the District Court are tried civil cases of minor importance and those involving sums not exceeding one thousand yen. The court also deals with criminal cases which are not felonies and those which do not require preliminary examination. The District Court handles cases of bankruptcy and those concerning personal status and arbitration. In rent and commercial disagreements, an arbitration committee, composed

Digitized by Google

of one judge and two laymen experienced in the matters involved in the dispute, may be appointed. The jurisdiction of a local court covers an average area of 2,587 square miles and a population of about 218,209.

The Local Court conducts trials of first instance of cases beyond the jurisdiction of the District Court and preliminary examinations of criminal cases of a complicated character.

The Local and Appeal Courts are the courts of second instance. The former handles cases on appeal from the District Courts, and the latter appeals against the first instance decisions of the Local Courts.

The court of third instance is the Supreme Court, which tries all civil and criminal cases which are brought before it, and conducts preliminary trials for (1) serious offences against the Imperial House, (2) high treason, and (3) offences committed by members of the Imperial Family.

There is one Supreme Court, and there are seven Courts of Appeal, 51 Local Courts and 291 District Courts.

Attached to each of these courts is a procurators' office, its functions being to conduct investigations, institute prosecutions, supervise the execution of sentences in criminal cases, and act as representative of the public interest in civil cases (For further details, see Chapter XXVII).

The Department of Education All matters relating to education, art, science, literature, and religion are under the direction and supervision of the Minister of Education. There are six bureaux and one division in the Department, i. e. (1) Bureau of Semmon (College) Education, (2) Bureau of Common Education, (3) Bureau of Technical Education, (4) Bureau of Social Education, (5) Bureau of Books, and (6) Bureau of Religion. There is also a Division of Student Control.

Six imperial universities, 2 commercial colleges, 7 medical colleges, 2 technical colleges, 2 normal colleges, 4 higher normal schools, and 76 colleges and special educational institutions come under the direct administration of the Department (see Chapter XXVIII).

The following institutions are also established and controlled by this Department :—the Epidemic Laboratory ; the Aeronautics Laboratory ; the Tokyo Astronomical Observatory ; the Seismological Observatory ; the Chemical Laboratory ; the Mineral Laboratory ; the Imperial Library ; the Meteorological Observatories ; the Latitude Observatory; the Tokyo Science Museum; the Physical Education Laboratory ; the Navigation Institute ; the Geodesy Committee ; the Examining Committee for Teachers' Licences ; the Physical Sciences Literature Committee, for preparing a national list of books on physical sciences, as a branch of the International Committee for the same purpose ; the Imperial Academy, which is composed of one hundred scholars appointed by the Emperor and is established for the promotion of science and culture ; the Imperial Academy of Arts, which is composed of 30 members under a president, its main work being organization of the annual exhibition for the promotion of fine arts; the Text Book Committee; the Science Council ; the National Language Committee ; the Aeronautics Council ; the School Hygiene Committee ; the Earthquake Disaster Prevention Committee ; the Religious System Investigation Committee ; the National Treasure Preservation Committee ; and the Temporary Committee on Romanization, which investigates the question of

Digitized by Google

Roman spelling of the Japanese Language.

The Department of Commerce and Industry The Minister of Commerce and Industry is assisted in administration of the Department by a parliamentary vice-minister, vice-minister and counsellor.

There are four bureaux in this Department, dealing respectively with commerce, industry, mining and foreign trade. All matters concerning insurance are handled in the affiliated Insurance Division. Examination and control of weights and measures is under the Central Weights and Measures Office. Other affiliated offices of importance are the Patent Bureau, the Mine Supervision Bureau and the Temporary Rationalization of the Industry Bureau.

In May, 1932, an ordinance was issued empowering the Minister of Commerce and Industry to establish two industrial laboratories, in Tokyo and Osaka respectively. These laboratories are open for the examination, analysis, and appraising of industrial commodities for the benefit of interested parties. Other institutions under the Department are as follows: the Fancy Mat Conditioning Houses, the Silk Experimental Stations, the Earthenware and Porcelain Experimental House, the Silk Goods Export Conditioning House, the Industrial Advice and Information Office, the Fuel Laboratory, the Industrial Art Examination Committee, the Unreasonable Low Price Investigation Committee, the Gas Business Committee, and the National Products Promotion Committee.

The Department of Agriculture and Forestry The Minister of Agriculture and Forestry controls all matters concerning agriculture, forestry, marine industry, stock-breeding and the enforcement of the Rice and Cereals Law. The Department is divided into the following five bureaux:—(1) The Agriculture Bureau, which takes charge of matters concerning agriculture, tea production, subsidiary industry among farmers, industrial unions, the central chest of the industrial unions, and the enforcement of the Rice and Cereals Law. (2) The Forestry Bureau, which deals with all matters concerning forests and meadows. (3) The Fisheries Bureau. (4) The Stock Breeding Bureau, which deals with the improvement and breeding of domestic animals, their hygiene, insurance and hunting. The Silk Bureau handles matters concerning sericulture and the silk industry.

The following institutions are under the direct control of the Minister:—the Agricultural, Horticultural, and Forestry Experimental Stations, the Fisheries Institute and Fisheries Experimental Stations, the National Stock-sheep Pastures, the Animal Disease Examination Institute, the National Bull Pastures, National Poultry Station, the Sericultural Laboratory, the Raw Silk Conditioning Houses, the Tea Experimental Houses, the Rice and Cereals Committee, the Silk Price Committee, the Committee on Subsidies for the maintenance of a proper silk price.

The Department of Communications The Minister of Communications administers the State post, telegraph, telephone and beacon services, and is in charge of all matters relating to electricity, hydraulic power and aviation. All business enterprises of electricity, ship-building, and water transportation together with navigation routes, ships and seamen are under his supervision. He also directs the operations of the Nippon Wireless Telegraph Company.

The Minister is assisted by a parliamentary vice-minister, and a

Digitized by Google

counsellor. The Secretariat, beside the ordinary secretarial work, supervises the training of clerks who are expected to enter the communications service and all matters concerning communications exhibitions. There are seven main bureaux in the Department, i. e., Postal Service Bureau, Telegraph and Telephone Service Bureau, Bureau of Engineering, Bureau of Electricity, Bureau of Mercantile Ships, Aviation Bureau, and Bureau of Accounts and Supplies.

There are in addition the following affiliated offices :— Bureau of Savings, Bureau of Post Office Life Insurance, Lighthouse Bureau, and Communications Bureau. The Savings Bureau handles matters concerning the Post Office savings, and their transfer to the national deposit. The Post Office Insurance Bureau handles matters pertaining to insurance and pensions for the working classes.

The following institutions are under the direct supervision of the Minister :— the Electro-Technical Laboratory, the Marine Court of Inquiry, the Marine Labour Exchange Committee, the Post-Office Life Insurance Investigation Committee, and the Post-Office Life Insurance Reserve Fund Utilization Committee.

The Department of Railways The Minister of Railways administers all the affairs relating to the railways operated by the Government and supervises the operations on land of all private railway companies. The Department is divided into seven bureaux, namely, Bureau of Local Railway Administration, Bureau of Traffic and Operation, Bureau of Construction, Bureau of Mechanical Engineering, Bureau of Maintenance and Improvement, Bureau of Electricity, and Bureau of Finance and Purchasing. Recently, there was operated a special Tourist Industry Bureau for attracting foreign tourists, which is subdivided into the Controlling and Investigating Section and the Promoting Section. The administrative work of the state railways is apportioned to six local regions : Tokyo, Nagoya, Osaka, Moji, Sendai and Sapporo. Each region is in charge of a director who has full powers to conduct all but the most important affairs within his jurisdiction.

The Department of Overseas Affairs The Minister of Overseas Affairs supervises the administrative work of the Chosen Government-General, the Taiwan Government-General, the Kwantung Government, the Karafuto Government, and the Government of the South Sea Islands. He also supervises the business operations of the South Manchuria Railway Company and the Oriental Development Company. He directs all matters concerning emigration excepting those of a diplomatic nature. For the performance of these duties, the Minister is empowered to direct and supervise consuls stationed in foreign countries in consultation with the Foreign Minister. There are, beside the Secretariat, the following four offices in the Department ; the Chosen Office, (having a special status and being always under the direction of the vice-minister), Industry Development Bureau, the Supervision Bureau, and the Exploitation Bureau.

The Privy Council

The Privy Council is a consultative body to advise the Emperor on questions of grave importance. The Council is composed of one President, one Vice-President (non-voting) and 24 Councillors. All the Councillors are officials of shinnin (highest) rank. All these members are appointed by the Emperor on

Digitized by Google

the advice of the Prime Minister. Cabinet Ministers are entitled by virtue of their office to sit in the Privy Council as councillors and have the right to vote. Princes of the Blood who have attained their majority and are resident in Tokyo can sit in the Council under the same conditions.

The questions that are to be submitted to the Privy Council for deliberation cover:

(1) All matters that fall within its jurisdiction according to the provisions of the Imperial House Law.

(2) All matters concerning interpretation of the provisions of the Constitution and laws and ordinances supplementary thereto.

(3) Proclamation of Martial Law under Article 14 of the Constitution, Imperial ordinances under Article 8 and Article 70, and any other Imperial ordinance which has a disciplinary clause.

(4) Treaties and all other international pledges.

(5) All matters involving an amendment in the organization and procedure regulations of the Privy Council.

(6) Other matters submitted to the Council by the Emperor.

Though the Privy Council is thus the highest consultative organ of the Emperor in important matters of state, it has nothing to do with the actual government administration.

Ministers Outside the Cabinet

There are two important offices of a quasi-administrative character of which the holders are styled "Daijin" (Minister). These "Ministers" are not members of the Cabinet and do not change with the Government.

The Office of Keeper of the Privy Seal is generally regarded as the senior of these offices. Its holder has the duty of keeping the Imperial Seal and the Seal of State, and of supervising secretarial work in connection with Imperial Edicts and Rescripts and other documents of the Imperial Court. The other office is that of Minister of the Imperial Household Department. The Minister is in charge of all business concerning the Imperial Household. (Consult the chapter on Imperial Court for fuller information as to their duties.)

The Board of Audit

The Board of Audit is provided for by Article 72 of the Constitution and is on an equal footing with the ministers of state. It is composed of a president, three divisional chiefs and 12 inspectors, who are appointed by the Emperor on the advice of the Prime Minister, but cannot be dismissed, transferred or placed on the retired list except by effect of either a criminal or a disciplinary trial.

The function of the Board is to audit accounts of the central government and other corporate bodies, public or private, receiving government subsidies or guarantees.

The Court of Administrative Litigation

The law of 1890 which established this Court is envisaged in Article 61 of the Constitution. The Court is entirely distinct from ordinary judicial courts and its function is to decide on the validity of administrative acts. The Court is not interfered by the Government. According to the law the Court of Administrative Litigation is to be located in Tokyo and no local court established. It is composed of a President and 11 Counsellors. Its members are appointed by the Emperor on the advice of the Prime Minister and are not to be removed, suspended from office or

Digitized by Google

deprived of position, without their consent. This is exactly the same as with ordinary judges (see Chapter XXVII), but the differences are that the former's position is not for life, while the latter's is and that there is no institution of the retiring age for the former. The present head of the Court is Dr. Hyoji Futakami.

The Court passes on cases relating to (1) the levying of taxes and fees except the customs tariff; (2) the disposition for the recovery of taxes in arrears, (3) the prohibition or suspension of business, (4) waterways and public works, and (5) fixing the boundary between the Government and private owned lands.

An appeal is immediately taken by the Court and the decision on it is given by a majority vote of the council of more than 5. The decision is the first, and at the same time, final.

Government Officials

Civil officials are divided into four ranks according to their grade of merits, education and ability, and their salaries differ accordingly. The four ranks are: (1) Shinnin rank, appointed by His Majesty directly, (2) Chokunin rank, appointed by His Majesty's order indirectly, (3) Sonin rank, appointed by His Majesty's approval, and (4) Hannin rank of minor officials appointed by the heads of different offices.

At the end of 1933, civil officials who received salaries from the State Treasury numbered 132,987 in total, their salaries amounting to ¥159,579,259, of which officials of shinnin and chokunin rank numbered 1,535 with an aggregate salary of ¥7,883,000 a year, officials of sonin rank 14,447 with ¥37,581,000, and officials of hannin rank 117,005 with ¥114,115,000. The average salary of officials of chokunin rank was ¥5,135, a year, that of officials of sonin rank ¥2,601 and that of officials of hannin rank ¥975.

As to the number of officials of chokunin, sonin, and hannin ranks classified according to departments, the Department of Communications had the largest with 27,847, which was followed by 27,441 of the Department of Railways, 13,489 of the Government-General of Chosen and 12,094 of the Department of Finance. Departments other than those given above had less than 10,000 each, viz. the Department of Justice had 8,577, the Department of Education 7,808, the Government-General of Formosa 6,003, the Department of Agriculture and Forestry 3,897, the Home Department 2,429, Department of War 2,153, Government of Kwantung Province 1,831, the Department of Commerce and Industry 1,796, the Department of Marine 1,366, the Government of Saghalien Island 1,117 and the Department of Foreign Affairs 1,107. Other Departments had less than 1,000 each. Among prefectural offices, Hokkaido Office had 2,315, Tokyo Metropolitan Police Office had 1,327 and all other prefectures together 9,220. Each prefectural government office had 200 on the average.

Number and total amount of salaries paid to civil officials of the Government in the past 10 years follow:

Year	Number	Salary
1924	137,566	¥147,130,579
1925	144,925	153,939,715
1926	148,014	161,150,445
1927	124,116	147,096,570
1928	128,792	156,572,037
1929	134,831	163,745,391
1930	126,995	160,265,485
1931	134,537	160,644,249
1932	130,988	157,688,618
1933	132,987	159,579,259

The Imperial Diet

The parliamentary system could not develop in Japan before the Meiji Restoration, because politics were controlled by the Samurai class for hundreds of years. Thus, the Imperial Diet was established solely according to the pattern of Western countries. In accordance with the promise contained in the Charter Oath of the Emperor Meiji, councils or assemblies of various kinds were established at the beginning of the Meiji Era, but their members were not elected by the people and consequently they were of a different nature from the parliaments of the West. In 1881 it was promised to convoke a National Assembly within 10 years, and the Imperial Diet on Western lines was first opened in 1890.

The Diet is much limited in its power and the duration of its sessions, but in its fundamental nature it has much in common with the national assemblies of Western countries. According to Art. 5 of the Constitution, the legislative power belongs to the Emperor and the Diet's function is only to give (or presumably withhold) consent to legislation proposed by the Throne. But this is a formality, and the Diet has almost the same power of legislation, including that of initiative as the parliaments of other civilized nations. At the same time, the Diet, in virtue of its being an assembly of representatives, has been invested with the power of supervising the administrative organs, as represented by the state ministers. It is a bicameral legislature, consisting of the House of Peers and the House of Representatives, and the decisions which are harmoniously made by both Houses are the decisions of the Imperial Diet.

The House of Peers The House of Peers is composed of the Imperial Princes, Peers, and Imperial nominees, according to the provisions of the House of Peers Ordinance. This Ordinance was promulgated at the same time as the Constitution and has been revised several times since. In 1925, important revisions were made to the effect that the number of the peerage members was lessened and that of the representatives of the wealthy people was increased, together with an addition of representatives of the Imperial Academy. Thus the former majority of peerage members was brought to an end and their number became equal to that of members chosen by Imperial order.

According to the present House of Peers Ordinance, the House is composed of the following members:

(a) all the Imperial Princes above 20 years of age, and the Kōtaishi and Kōtaison if above 18.

(b) all Princes and Marquises above 30 years of age, with the term of office for life.

(c) 18 Counts, 66 Viscounts and 66 Barons elected by the Peers of their respective ranks. They must be above 30 years of age and their term of office is 7 years.

(d) Imperial nominees from among statesmen and scholars who have made valuable contributions to politics or science. They must be above 30 years of age and their term of office is for life. Their number must not exceed 125.

(e) 4 members of the Imperial Academy, elected by the members thereof and nominated by the Emperor. Their term of office is 7 years.

(f) Members elected by and from among the highest tax-payers, in any prefecture, in direct national taxation on land, income and business profits. Each member represents 100 such high tax-payers, his age

Digitized by Google

must be above 30, and his term of service is 7 years. The number of this class of members must not exceed 66.

The House of Peers, therefore, consists of 150 Counts, Viscounts, and Barons, 195 representatives of statesmen, scholars and wealthy business men, and a certain number of Imperial Princes, Princes and Marquises, the number of the last named not being fixed for obvious reasons. The present (November, 1934) total of the members of the House of Peers is 409, vacancy 3.

The House of Representatives The House of Representatives is composed of members elected by the people in accordance with the provisions of the Electoral Law. This Law was first promulgated simultaneously with the enactment of the Constitution in 1886, and has undergone many minor revisions since. Important revisions were made in 1900, 1919 and 1925. The Law of 1889 required yearly payment of direct national tax of ¥15 as a qualification for both candidates and voters, and prescribed the system of small constituencies and the open ballot. In 1900, the requirement of tax payment was removed in the case of candidates and lowered to 10 yen for voters. Constituencies were divided into two classes municipal and rural, making each city an independent district and each prefecture one district; and the secret ballot was adopted. In 1919, the tax requirement was again lowered to 3 yen and the old small constituency system revived. In 1925, the male universal suffrage system was finally adopted, the division of municipal and rural districts was abolished, and a system of constituencies electing from 3 to 5 representatives each was established.

The universal suffrage of Japan is restricted as yet in comparison with that of Western countries, as to sex, age, residence and the conditions of eligibility. Women are totally ineligible and the age qualification for male voters is 25. The Electoral Law itself says nothing of the restriction on residence, but the list of voters must be made by Sept. 15 of the year previous to that of the general election and only persons who have lived a minimum period of one year in the same city, town or commune are eligible for inclusion. The Law also contains provisions for withholding the right to vote from criminals, legally disabled persons, such as bankrupts etc., actual holders of peerages, persons engaged in active combative service.

Candidates must be 30 years of age; otherwise their qualifications are the same as those for voters, except that of residence. The present number of the members of the House of Representatives is 440, vacancy 26.

According to the relevant articles of the Constitution, the Diet has power over all affairs of state which belong to the responsibility of the State Ministers. There is, however, a working but not complete separation of the legislative and executive powers between the Diet and the Ministers. There are certain statutory limitations of the Diet's power to control the executive. The Imperial Diet must not interfere with matters pertaining to the Imperial House. Except in regard to matters within the Diet itself, it can neither use the power of administration directly upon the people nor represent the State vis-à-vis of foreign nations.

Fixed Number of Lower House Representatives and Number of Votes at Recent General Elections

Date of election	Representatives	Voters
March, 1904	379	757,788
May, 1908	379	1,582,676

Feb., 1932	466	13,095,621

Function of the Diet The Diet has five kinds of function, namely, constituent, legislative, financial, general supervision of the administration, and executive on matters in the Diet itself.

(1) The constituent power of the Diet is confined to deliberation on constitutional amendment initiated by the Throne. Action can only be taken by a two-thirds majority of a quorum of two-thirds of the membership of both Houses, as provided for in Article 73 of the Constitution.

(2) The Emperor exercises the legislative power with the consent of the Imperial Diet and all laws and legislative ordinances must obtain that consent. Bills may be presented by the Diet itself as well as by the Government. The right of consent of course contains the rights of amendment and rejection. This right is subject only to the condition that the Diet's action does not contravene the Constitution, the Imperial House Law, and international law. Thus the power of legislative "consent" contains within it that of initiative. Legislative ordinances promulgated by the Emperor must be submitted to the Diet at the next session for approval or rejection but not amendment.

The legislative authority of the two Houses is equal in theory, and projects of law may be initiated in either. Naturally, therefore, no legislative enactment is complete without the consent of both Houses to all its provisions.

(3) The national budget must get the consent of the Diet. The budget is presented by the Government first to the House of Representatives, but consent to it must be accorded by both Houses. Article 70 of the Constitution, however, empowers the Government to take all necessary financial measures by Imperial Ordinance, and Article 71 empowers it, if the Diet has not voted in the budget or if the budget "has not been brought into actual existence" to carry out the budget of the previous year. National loans must obtain the consent of the Diet. All contracts outside the budget which involve state financial liability must also be approved by the Diet. Any disbursement of public money by the Government made without the Diet's consent between sessions must be submitted for approval at the earliest opportunity. The restrictions of the Diet's financial power, other than those mentioned above, are clearly stipulated in Article 67 of the Constitution. It is to be noted that the Budget as a project of administrative action is confined to expenditure. Revenue is determined by law, so that the Diet's control thereof comes within its general legislative competence.

(4) The responsibility of Ministers, collective or individual, to the Diet is not clearly established either in law or custom, but so far as the responsibilities of Ministers are concerned, the Diet clearly has a certain supervisory power. The Government can do what it wishes without the consent of the Diet in its administrative function, but the Houses can express independently of each other their judgement on what the Government had done. They may present written appeals to the Emperor against the actions of State Ministers. They can make proposals by resolution to the Government concerning administration. They may receive petitions from the people

Digitized by Google

(the only function of the Diet to keep a direct contact with the people), and if these concern administrative matters, they are handed to the Government with the opinion thereon of the House to which they were addressed. The Houses may also pass resolutions on important state matters which are not addressed to the Government directly, but which, being made public as they are, naturally have an effect on the Government's popularity if they contain adverse criticisms. In these ways the Diet subjects the Government to a limited measure of control.

The Diet has the right of investigating the conduct of the administration, although this is very narrowly limited and rarely used. The Diet has the right of making inquiries on the responsibilities of the Ministers, the right of receiving reports from the Government on the income and disbursements of the National Treasury, on the handling of petitions sent in by the people through the Houses, and on serious diplomatic questions, unless they are such as require absolute secrecy.

(5) The Houses of the Diet have the right of self-government as to the regulations of their own Houses, on the procedures of session, on the police system in the Houses. The House of Peers has also the right to be consulted by the Emperor as to the privileges of peers.

The Diet is convoked annually by the Emperor (under Article 41 of the Constitution) for a period of ordinary session of 90 days. This period may be prolonged if necessary by Imperial order. Extraordinary sessions can be convened in the same way. The annual session is usually called at the end of year, although there is no regulation to this effect in the Constitution, and continued to the end of the following March, so that the budget can be voted before the new fiscal year begins. The Emperor may give orders to open or close the Diet; or suspend the session for a certain number of days for negotiations between the Diet and the Government or the two Houses; or dissolve the House of Representatives. All these actions are taken on the advice of the Prime Minister.

Officials of the Houses Each House has a President and Vice-President. The President not only presides and keeps order during the sessions but also directs the business of the House between sessions. The manner of appointment of the officers differs in the two Houses. In the House of Peers, they are appointed by the Emperor from among its members for a term of 7 years, the House itself having nothing to do with the appointment. In the House of Representatives, the House chooses three candidates for each of these positions and the Emperor makes the appointments from among the candidates. Their term of office is that of the life of the House.

There is an Official Bureau attached to each of the Houses, and officials such as the Chief Secretary, secretaries, stenographers, and the chief sergeant are appointed by the Government although they act under the orders of the respective House Presidents. Several things in the Japanese parliamentary system have been copied from the British and this official bureau is one of them.

The House of Peers has five and the House of Representatives four standing committees, and special committees are appointed when the need arises. Each House may sit as a committee of the whole for which chairmen are elected at the beginning of the session. The procedure of discussions and resolutions is similar to that customary in the English-speaking countries.

Local Government

The units of local government are four: the prefecture, the city, the town, and the commune.

The Prefecture Japan proper, except Hokkaido, is administratively divided into 3 urban prefectures and 43 prefectures which are administered by governors. The function of the governor is to be the highest local administrative organ of state, and, at the same time, the head of the prefecture as a unit of local self-government. He is directly controlled by the Ministers of State and takes charge of the general national administration within his prefecture. In a prefecture all administrative business is unified under the control of the governor who supervises every kind of administrative work in the district according to the orders of the Premier and Ministers of the central government. Thus, the scope of his function is quite large and complicated. The appointment and dismissal of governors are made by the Minister of Home Affairs.

The system of prefectural government has undergone several changes and the nature of the work done is not necessarily the same in all the prefectures, but it is common, at present, to divide the duties into three divisions, namely, the Home Affairs Division, the Educational Division and the Police Division. Some prefectures have an Engineering Division.

As a unit of local self-government, the prefecture stands between the state and the municipalities. It has a prefectural assembly and a prefectural council as organs for decision, but the right of decision of these organs is much narrower than that of the city assembly and council, while the chief executive is the governor who is officially appointed by the Central Government.

The Prefectural Assembly is elected by universal suffrage, and the number of the members is fixed by the law. Membership of the assembly is honorary and the term of service is four years.

The Prefectural Council is composed of 10 members elected by and from among the assemblymen. The Governor is ex-officio chairman of the council, which is in fact a standing committee of the assembly, although entrusted with certain functions of arbitration which are not specifically devolved from the larger body.

Hokkaido is not divided into prefectural districts, but is itself an administrative unit as a whole, under one procurator, although it covers an area of 88,775.04 square kilometres and is thus many times as large as most of the prefectures. The procurator or chief is controlled by the Minister of Home Affairs directly and his function and duties are mostly the same as those of a prefectural governor. The special features of his function are that he undertakes colonization work, that as there is no national forestry law applied to the district the administration of forestry is left altogether in his power, and that he has to take care of the native Ainu according to the Protection Law for the Hokkaido Natives. The Hokkaido Office is divided into five divisions, namely, Divisions of Home Affairs, Education, Civil Engineering, Colonization and Police. The organization and rights of the Hokkaido Assembly and Council are almost the same as those of similar bodies in the prefectures. (On the governmental system of the Colonies see Chapters XL–XLIII.)

The Municipality (City, Town, Village) In 1932 there were 112 cities, 1,716 towns and 9,946 villages in Japan proper. (A village here means an

Digitized by Google

administrative unit composed of a village or villages.)

There was some measure of local self-government in old Japan. The heads of villagers were chosen from among the villagers and were asked to rule over them. For some time after the Meiji Restoration, these customs were continued, although the official names of the heads of villages were changed. Moreover, towns and villages were allowed to exercise the right of managing public affairs with their own money as financial units. But it was with the formation of prefectural assemblies according to the new laws issued in July, 1878, that the local self-government of Japan began to assume a modern form. The self-government system of cities, towns and communes has been several times revised, the last revision being that of 1929.

There were formerly several restrictions on citizenship of the local communities, but according to the laws now in force every man is entitled to it in virtue of the male universal suffrage principle. The requirements of citizenship are about the same as those for the right to vote in parliamentary elections. Every male inhabitant of and above 25 years of age who has resided for a minimum period of two years in the same municipality is a citizen of the same and has the right to vote or to be elected and at the same time owes the duty of accepting any honorary post of service to which he may be elected.

The organs of local self-government are the assemblies of the representatives and the chiefs of the municipalities. The fixed minimum number of representatives in these assemblies is 30 in the cities and 12 in the towns and communes. The cities have also councils of ten members elected by and from among the assemblymen.

The Mayor of a city is a salaried official while the corresponding posts in a town or commune are honorary in principle. Mayors are elected by their respective assemblies for a term of four years. Their function and responsibilities are diverse, for they not only administer the affairs of the municipalities but also handle matters delegated to them by the central and prefectural governments and are entrusted with the supervision of some public bodies. As servants of the central government they take charge of the census register and all the business related to it, the election of the members of the Lower House, several kinds of national investigation, public engineering, public hygiene, relief work, educational supervision and encouragement, and certain work under the Conscription Law. This work is done without consulting the local assemblies, but simply as entrusted by the respective national officials.

CHAPTER V

PARTIES AND POLITICS

Pre-party Cabinet Period

Japan's modern political life fairly started with the promulgation of the Constitution and opening of the Diet. The Imperial Edict for opening the national assembly within ten years was issued (see Chapter III) on October 12, 1881.

Party Formation Upon the issuance of the Imperial Edict parties began to be formed with a view to be prepared for the opening of the Diet. On October 18, 1881, the colleagues and comrades of Taisuké Itagaki drafted the rules of the new Jiyu-to Party and elected Itagaki President and N. Nakajima Vice-President at a preparatory meeting which was held at Asakusa, Tokyo. The governing principle of this party was that of Rousseau's social contract.

The next great party to be organized was the Kaishin-to. It came into being in March, 1882, with Shigenobu Okuma as President. The leading thought of this party was English liberalism, and it aimed at a healthy, mild policy with the educated class of people as its central constituency. It was, therefore, natural that the Kaishin-to won the sympathy of the intelligentsia of the cities, while the Jiyu-to got a hold on the people in the country districts, where the inhabitants were peasants who sympathized with more radical political thought because of their long sufferings under the feudal governments. Nowadays it can no longer be considered that the strength of the Minsei-to lies mainly in urban, and that of the Seiyukai in the rural constituencies, but until a few years ago this clear difference in spheres of influence was very marked. Many parties were born contemporaneously. It is said that there were formed 40 parties, besides these two, mostly local.

The first Ito Cabinet, which was organized in 1885 was not, of course, connected with any political party.[1]

The First Election The Jiyu-to was once dissolved into smaller groups, and the first general election was carried out amid a general confusion of political parties. Its result was as follows so far as the political parties were concerned:

Daido Club 55, Kaishin-to 46, Patriotic Public Party 35, Conservative Party 22, Kyushu Association 21, Jiyu-to 17, Jichi-to 17, Officials 18, neutrals 69, independents 2.

This result presented a grave problem to the political parties, for none had a clear majority in the House of Representatives, so various amalgamations were effected before the opening of the first session of the Imperial Diet, and when it opened the classification of the members became as follows:

The Rikken-Jiyu-to (or Constitutional Liberal Party) 130, the Rikken-Kaishin-to (or Constitutional Progressive Party) 41, Taisei-kai 79, National Liberal Party 5, and outsiders 45. The first two were anti-government parties, while the second two were pro-government. The remaining 45 were neutral.

The first platform of the Constitu-

1 For the political movement before the issuance of the Imperial Edict see the Japan Year Book, 1933.

Digitized by Google

tional Liberal Party was: (1) To maintain the sacredness of the Imperial House and to extend the rights of the people, (2) To oppose such policies as might interfere with the free individual life of the people in home affairs, and to conclude treaties on equal terms in foreign affairs, (3) To realize parliamentary government and organize a party cabinet. And with these ideals the party men waged a fight for the establishment of a real parliamentary government. The number of anti-government members in the Lower House far exceeded that of the pro-government, and the bureaucratic Yamagata Cabinet feared for its very existence. Hostilities between the two started with the choice of the President of the House of Representatives and continued over the first budget subjected to the discussion of the House. The budget amounting to ¥83,075,000 was cut down to ¥75,194,300, or about 9% reduction. But the first session of the Imperial Diet was closed in March, 1891, without dissolution.

Itagaki's Party Suffers The party which suffered most from the poison of secret governmental control was the Constitutional Liberal Party, and they held a general meeting at Osaka immediately after the first session of the Diet. At the meeting, Itagaki, who had retired when the party had been once dissolved, was again chosen President, its name was made simpler by cutting away the first word "Constitutional," and the unity of its members was strengthened. The Matsukata Cabinet was formed in May of the same year; its head was as strong a foe to political parties as Yamagata, if not more so. Then there occurred the attack of a murderous fanatic on the Crown Prince of Russia at Otsu near Lake Biwa and a great earthquake wrought fearful destruction in Mino and Owari provinces; the Government was unable to cope with these emergencies while it was discredited in its policy against the parties.

Matsukata Cabinet Falls The second session of the Imperial Diet was convoked on Nov. 21, 1891, in a menacing atmosphere from the outset, and was finally dissolved on Dec. 25. The general election of Feb. 15, 1892, was carried out under extreme interference of the Government. Shinagawa, Minister of Home Affairs, ruled the local governors with an iron hand and used every effort for obtaining as many pro-governmental members as possible, the freedom of the vote being completely trodden underfoot. It was reported that 25 persons were killed and 388 were injured in this savage struggle. The result was, however, the victory of the anti-governmental party men, who numbered 163 against 137 of the pro-governmental, and they passed a vote of non-confidence in the third session, although the stubborn Matsukata Cabinet clung to its position in defiance of it.

But the Cabinet fell to pieces from within, and the second Ito Cabinet was formed in August, 1892. It was Ito who drafted the Constitution and stood aloof from the political parties in those days, although he later became the President of the Jiyu-to or the Liberal Party himself. And the Ito Cabinet cleverly managed the fourth session of the Diet. But the Cabinet was taken to task by the Diet over the misbehaviour of some Ministers and the fifth session was dissolved without any reason given on Jan. 30, 1894. At the third general election the Ito Cabinet took a very fair attitude, because Ito was always anxious to be or at least to seem constitutional. Its outcome was again disadvantageous to the Government, and the sixth session,

Digitized by Google

which was convoked on May 12, 1894, was dissolved on June 2 because of the non-confidence resolution on the last dissolution and the diplomatic inability of the Government. It may be remarked here that Tsuyoshi Inukai, the late Premier, appeared on the surface of the political world for the first time at this session. He was a member of the Lower House from the beginning and had organized a progressive party of his own a little before this, but his motion of wholesale non-confidence was the first occasion that his earnestness and sincerity for the maintenance of parliamentary authority began to show itself.

The Sino-Japanese War The interval between the sixth and seventh sessions was but half a year, yet it was marked by many important political and diplomatic affairs. The Sino-Japanese War, 1894-1895, broke out in July, 1894. The general election was carried out on September 1 of the same year. The seventh session had been expected to witness a repeated collision of the Diet and the Government, but the first international war drew all the attention of the people and the session closed peacefully after lasting but four days instead of a week as fixed, on the 22nd of October, 1894, at Hiroshima, where the Emperor was staying during the war to command the Imperial Army and Navy. All parties were united for the national cause and supported the Government with one accord, and the military emergency budget amounting to ¥150,000,000 was immediately passed without any reduction. All the political conflicts at home were stilled in the face of the international war and the eighth session convoked on Dec. 22, 1894, was quietly carried out. The peace treaty with China was sanctioned on March 20, 1895. But the interference of the Three Powers on the lease of the Liaotung Peninsula aroused indignation throughout Japan, and this feeling soon centred in an attack on the Government.

A Political Bloc The Kaishin-to, Kakushin-to, People's Association, Chugoku Progressive Party, Financial Kakushin-to and Ohté Club were united in criticizing the Government's weak diplomacy, and formed a great union called the Central Representative Club. The Liberal Party did not join the Club, because it had come to some understanding with the Government, and had a special connection with Ito, who gradually had drawn nearer to this political party. The tacticians in both the Government and the Liberal Party had succeeded in bringing Ito and the party nearer, and just before the 9th session the Liberal Party took off its mask and openly declared its coalition with the Ito Cabinet. This was the first instance of a political party being publicly united with the Government.

The Progressive Party Ito's policy was a success and the 9th session ended in the victory of the Government by the faithful support of the Liberal Party. The defeated parties recognized the need of a stronger union and on March 1, 1896, the Kaishin-to, Kakushin-to and three other bodies dissolved themselves and organized the Shimpo-to or Progressive Party under Okuma. The platform of the new party was to exalt the sacredness of the Imperial House and to advance the rights and welfare of the people, (1) by establishing a responsible cabinet with the removal of political evils, (2) by enlarging the national power with the renovation of diplomacy, and (3) by developing private enterprises with the readjustment of financial policy.

From now onwards the Liberal Party and the Progressive Party be-

Digitized by Google

came rivals as the greatest political parties in the country. The members of the Lower House, by party grouping, were as follows at the end of March: the Liberal Party 110, the Progressive Party 100, Peoples' Association 32, Yamaguchi Group 5, Kishu Group 4, unaffiliated 49.

Itagaki Joins Ito After the 9th session, Itagaki of the Liberal Party entered the Ito Cabinet and took the post of Home Minister. The Ito Cabinet was in power three full years and managed numerous political matters of importance, but it collapsed in August, 1896. The Matsukata Cabinet which came next was a coalition of Matsukata's Satsuma clan and Okuma's Progressive Party. This cabinet took a very progressive policy in removing long political evils and financial defects and its activity was welcomed with much expectation. But the Liberal Party, now in opposition, was ready to make attacks against the Cabinet which contained Okuma, their political enemy. The tenth session which was convoked on Dec. 25, 1896, passed off with little trouble for the Government, although the Liberal Party attacked it on the score of its foreign diplomacy. It is to the credit of the Matsukata Cabinet that it established the gold standard of national currency.

Exit Okuma Okuma, Home Minister, resigned in November, 1897, and the relation between the Cabinet and his party was severed. Matsukata now endeavoured to get the support of the Liberal Party, but in vain, and the Cabinet faced the 11th session of the Diet without any assistance from political parties. A non-confidence resolution was proposed by 38 members in the session and seconded by 150. On Dec. 25, 1897, the Lower House was suddenly dissolved, and the Cabinet itself resigned in miserable defeat. Ito was ordered to form a cabinet for the third time, and it was again a transcendental one. The 12th session was begun on May 14, 1898. The Government proposed an increase of taxes on land, saké, and incomes, but was defeated by an absolute majority of 247, and the House was dissolved in revenge. This action of the Government, however, greatly stimulated the development of anti-governmental parties and brought about an extraordinary political phenomenon. It was but a faint herald of the dawn of party government, but it gave a real shock for the first time to the foundations of the clan and bureaucratic forces in Japanese politics. Both the Liberals and the Progressives had had a very hard time in the past to wage war against clan statesmen and bureaucracy, but in most cases they had been treated by the latter like mere instruments for accomplishing their own purposes. Now they came to their senses and saw that their real foes were these same clansmen and bureaucrats who monopolized the government, and that their first aim must be the destruction of them. On June 21, 1898, both parties held final meetings simultaneously and dissolved themselves, and on the 22nd they all met at the Shintomi Theatre, Tsukiji, and amalgamated themselves into a new party, the Kenseikai, or Constitutional Party, to put an end to bureaucratic government and to establish that of a party.

The Kenseikai and Ito All the elder statesmen, clan and bureaucratic bodies were alarmed in the extreme by this organization of the Constitutional Party. A meeting was called before the Emperor on the 24th and a hot discussion on counter measures against the power of the party was continued for several

Digitized by Google

hours. Ito asserted that there were but three ways for him to meet the situation: either to form a governmental party himself to carry on the government, or to resign first and form a party to support the Government from outside, or lastly to surrender altogether before the Constitutional Party and let them organize a cabinet with Okuma and Itagaki at their head. Yamagata of the Nagato or Choshu clan was firmly opposed to this proposal and declared, "It is against the Japanese Constitution to establish a cabinet upon a party foundation; let us quit the Constitution for the time being if necessary to meet the critical moment!" On June 27, 1898, however, Okuma and Itagaki were finally called to the Imperial Court and ordered to form a cabinet. A coalition cabinet was thus formed on the 30th of that month, all the posts except those of Naval and Military Ministers being filled by party men. Its composition was as follows:

Premier and Minister of Foreign Affairs, Okuma (Progressive); Home Minister, Itagaki (Liberal); Minister of Finance, Matsuda (Liberal); Minister of Justice, Daito (Progressive); Minister of Education, Ozaki (Progressive); Minister of Communications, Hayashi (Liberal); Minister of Agriculture and Commerce, Oishi (Progressive); Minister of War, Katsura (Choshu clan); and Minister of the Navy, Saigo (Satsuma clan).

It was, however, a combination of antagonistic forces for convenience' sake, and the partisans soon began to quarrel among themselves, so that the Constitutional Party, which tried to advance too quickly, soon split up again into the former Liberal and Progressive Parties, largely by the tactics of Toru Hoshi, who played an influential part in politics as a member of the Liberal Party, and was assassinated later in a room of the Tokyo City Hall. So the first party cabinet was compelled to dissolve without meeting a session of the Diet on Oct. 31, 1898, within four months of its formation.

Yamagata Returns Now came the turn of bureaucracy again, under Yamagata of the Nagato or Choshu clan (these two Japanese words indicate the same Nagato province at the south-western end of the Main Island), in November, 1898. Yamagata had had bitter experience with political parties and this time he succeeded in getting the support of the Liberal Party (which called itself Kenseito as yet) and handled the 13th session of the Diet as he wished, many important revisions of the national laws being made, and the military preparations being enlarged by raising the taxes on many important items.

It was during the life of this cabinet that the new treaties which had been concluded with foreign nations at the time of the former Ito Cabinet were put into force, and Japan came to stand on an equal footing with the other civilized countries of the world politically and diplomatically. This was on July 17, 1899. The Yamagata Cabinet accomplished great feats in the administration of complicated and extensive political affairs after the Sino-Japanese War, and laid the foundations for the future development of Japan. But as a representative of the old bureaucracy, a survivor of the discarded clan officials, he left many bureaucratic traces in the law and the governmental system by establishing the rule that the posts of War and Naval Ministers can be held only by officers on the active list, and by enlarging the power of the Privy Council, which hindered the healthy

Digitized by Google

development of political parties in later days.

Satisfied with his own performance in the enlargement of military preparations, completion of laws and institutions in general, revision of the election law, improvement of local governments, and advancement in the educational system and institutions, Yamagata tendered his resignation to the Throne in September, 1900.

Ito Forms the Seiyukai A little before that, Ito came back from his tour to China and wanted to organize a powerful political party himself, and the Liberal Party was anxious to get him to revive its power after its separation from the Yamagata Cabinet. The party wished to put Ito at its head, while Ito wanted to organize a party purely of his own without the help of any existing party. But the general trend of political affairs at this time finally compelled these two to become united into one, and the Liberal Party was renewed by Ito, assuming a new name, the Constitutional Liberal Party, or Rikken Seiyukai, on Sept. 15, 1900. On Oct. 9, 1900, Ito formed a cabinet for the fourth time, and it was welcomed by the party men and the people at large, but the reactionary movement of the House of Peers shortened its life, and Ito never again had an opportunity for organizing a cabinet, although he had much to do yet for national politics, especially in the field of Korean affairs.

The Katsura Cabinet On June 2, 1901, General Katsura formed his cabinet upon the basis of bureaucracy again. Katsura and the members of his Cabinet were rather young compared with those of the preceding cabinets, and the Elder Statesmen were anxious about their ability, but Katsura was quick to see the unrest in the Seiyukai and immediately took steps to control it for the convenience of the Government. In this he succeeded fairly well, and the 16th session of the Diet passed off in peace, at the beginning of the year 1902, winning, at the same time, the general applause of the people on the conclusion of the Anglo-Japanese Alliance on Feb. 12, 1902. The 7th general election was held on Aug. 10, 1902, in which the number of the Lower House members was enlarged from 300 to 376, and as the result the Seiyukai gained 189 seats, the Kensei-honto 104, the Empire Party 18, the San-shi Club 7, and Independents 58. As is always the case with a bureaucratic cabinet, even this clever and skilled tactician met with strong opposition from the Elder Statesmen and the two great parties over the problem of raising funds for naval expansion by increasing the land tax, and the 17th session was dissolved because of a direct collision between the Lower House and the Katsura Cabinet. It did not end in the victory of the Government, but Katsura again made a painstaking effort to utilize parties, and found a way out in the 18th session by changing his policy from raising the land tax to floating a public loan to obtain the necessary means for the proposed navy extension.

Saionji Succeeds Ito The Katsura Cabinet had been in power over two years already and the general atmosphere suggested a change when the threatening state of affairs in Manchuria was further complicated by the aggressive policy of the Russian Government. Katsura was ordered to stay at his post although he tendered his resignation, largely because of the pressure of Ito, who was a Genro (see the article in Chapter IV, Government, for the meaning of "Genro") and the head of the Seiyukai at the same time. Ac-

Digitized by Google

cording to the advice of Yamagata and Matsukata, who were also Genro, Ito and Saionji exchanged positions and President Ito of the Seiyukai was appointed President of the Privy Council; while Saionji, President of the Council, succeeded Ito as that of the Seiyukai.

Saionji is the only remaining Genro at present. He was a progressive statesman, and it was his earnest desire to see a pure party cabinet come into existence sooner or later. He had been many times suggested as Premier but had always refused, as he considered it unreasonable and bureaucratic to form a cabinet with no backing in the House of Representatives, so he gladly accepted this proposal of the Seiyukai and made great efforts for the revival of the party, which had shrunk to 120 from its absolute majority of 193 at the beginning of the 18th session largely because of long inner disturbances.

At the same time, the rival party Kensei-honto was also experiencing the same kind of internal troubles because of Katsura's despotic policy for reducing the power of all parties, and it was natural that the two parties should unite to impeach the Katsura Cabinet. The 19th session was convoked at the end of 1903, with Kono, President of the House of Representatives, and Iyesato Tokugawa, that of the House of Peers. But this session was dissolved immediately after its opening meeting because of the resolution impeaching the Government.

War with Russia War was declared against Russia on Feb. 10, 1904. The emergency session of the Diet was convoked on March 18 and the regular one on Dec. 28 of the same year, and in the latter the Diet unanimously passed a budget of ordinary expenses ₹110,000,000 and war disbursement ₹780,000,000. The famous victories at Port Arthur, Mukden and the Japan Sea finally brought peace, and by the mediation of President Roosevelt the peace treaty was concluded between Japan and Russia on Sept. 5, 1905. On the same day riots broke out in Tokyo and other big cities because of the general dissatisfaction with the terms of the peace treaty, and Tokyo was put under martial law. Ito, President of the Privy Council, went to Korea by Imperial Order in November and that country was made a protectorate of Japan, Ito becoming the first Resident-General, while Komura, who returned from Portsmouth, immediately went to Peking and concluded treaties with China on Japanese rights and privileges to settle the problems arising from the peace treaty.

The Saionji Cabinet The Katsura Cabinet remained in power as long as 4 years and 7 months and accomplished several important enterprises, but taking the responsibility for the riots and for a disturbance in the Tokyo Imperial University, which also occurred in connection with the conclusion of the Peace Treaty, resigned in January, 1906, and Saionji was ordered to form a cabinet; but he failed to organize one of pure party-government because of the great power of bureaucracy behind the national politics. The most important measure in the 22nd session of the Diet was that for the State ownership of all railways. With great difficulty it was passed with an amendment by the House of Peers. The peace-loving Saionji strove for the civilization of Manchuria, transforming the military rule into civil administration. It was an expression of this policy that the South Manchuria Railway Company was established in this year.

While the Seiyukai became prosperous as the government party,

Digitized by Google

the Kensei-honto had a hard time and Okuma finally left it on Jan. 20, 1907.

The Saionji Cabinet continued for two-and-half years fighting against the forces of bureaucracy, and the Seiyukai obtained an absolute majority of 190 at the 10th election, May, 1908. But Saionji left his position a little after the election partly because of his illness and partly owing to the stubborn pressure of the bureaucrats, who were specially critical of his liberal policy toward the socialists, who had gradually increased in numbers since the Sino-Japanese War.

The Second Katsura Cabinet The second Katsura Cabinet which was formed on July 14, 1908, was of course bureaucratic. One notable phenomenon of the 10th election was the appearance of representatives of business men in the Lower House, prophetic of the rise of the business class who now rode on the universal tide of capitalism. Katsura saw the change of the times and allied himself with business men to realize his policy for a readjustment of the taxation system and consolidation of the public loan. But the Seiyukai having so large a number of seats as 193 in the Lower House at the 25th session, Katsura could do nothing without their agreement. With his usual tactics he came to a full understanding with them and the 25th and 26th sessions passed off very quietly.

The Kensei-honto kept only 65 seats in the Lower House and internal discord caused it to dwindle further. But stimulated by the increase of the Seiyukai, it united with other forces on March 13, 1910, and merged itself into a new party named the Rikken Kokuminto or Constitutional Nationalist Party. This new party had 92 members in the Lower House and was led by Inukai and Oishi.

During the three years' régime of the second Katsura Cabinet the outstanding events were the first general arrest of socialists and the annexation of Korea. The latter was hastened by the assassination of Ito by a Korean at Harbin station on Oct. 26, 1909. Terauchi, Minister of War, was appointed to the additional post of Resident-General of Korea in May, 1910, and on Aug. 29 of the same year Korea was at last annexed to Japan.

Army Division Increase Question Saionji became Premier for the second time on Aug. 30, 1911. His Cabinet was supported by 214 Seiyukai members in the House of Representatives and this time he could form it without much regard for bureaucracy, although he could not yet wholly get rid of its interference, both public and secret. While he was in power, the Emperor Meiji passed away amid the sorrow and lamentation of the people on July 30, 1912, and the Emperor Taisho came to the Throne. After this national event, bureaucratic forces began to work again and caused through General Uyehara, Minister of War, an increase of two Army divisions proposed. Uyehara resigned his position independently because of the rejection of his proposal by the Cabinet. Saionji asked Yamagata to recommend his successor, but this Elder Statesman, who had himself established the military minister system for military and naval departments, and was the leader of the bureaucratic and military forces, rejected Saionji's request, and the Cabinet collapsed at once.

But this plot of the dark forces stirred up the party men to the extreme, and loud cries arose for the destruction of bureaucracy and pro-

Digitized by Google

tection of constitutional government, when Katsura appeared for the third time to form his bureaucratic government. Katsura tried every means to still the general antagonism, but in vain. Inukai, Ozaki, Ohoka and other influential party men led the national movement with the backing of public opinion for putting an end to bureaucracy, and the situation became so critical that to push Katsura's policy further meant something like the outbreak of a civil war, consequently he was compelled to resign after but 53 days. This was an epoch-making event in the political history of Japan and real party-government was now at hand, although Katsura was succeeded by Yamamoto, who was one of the foremost navy men at that time.

Yamamoto to Okuma The defeated Katsura sadly realized the power of parties and organized the Rikken Doshikai or Constitutional Comrades Party after his resignation, and the 31st session of the Diet was held at the beginning of 1914, with the classification of members of the Lower House as follows:

Seiyukai	208	Chuseikai	37
Doshikai	93	Independents	7
Kokuminto	40		

The Yamamoto Cabinet was supported by the Seiyukai and had no doubt about passing the Navy Increase Bill. But the unexpected exposure of bribery in high naval circles, the so-called "Commission Scandal", caused the overthrow of the Government at the end of March, 1914. The council of Genro had a hard time in the choice of the person to be recommended for the Premiership, and after considering several candidates Okuma was finally ordered to form a cabinet.

About 15 years had passed since Okuma left his party the Kenseito, and when he once more took the position of Premier the public welcomed him with sympathy and he answered to the public goodwill by reducing the power of navy men in politics with the support of the Doshikai which contained many former members of the old Kenseito. It was during his Premiership that Japan entered the World War on Aug. 23, 1914.

It was the Seiyukai's turn to tread the thorny path of opposition. President Saionji had left it in 1913, and Hara had been its practical leader since then, and the number of members was declining when the question of election of the President arose. Opinions were divided and many a member wanted to call Saionji back, but he was too unselfish to accept the proposal and earnestly recommended Hara to be the new President of the Seiyukai.

The new President Hara was a plain untitled man, but a man of rare ability, and the Seiyukai renewed its strength under his leadership.

Okuma's Sweep The 35th session was dissolved because of the rejection of the Army Division Increase Bill by the Seiyukai and the Nationalist party. The general election of March, 1914, ended in victory for the pro-governmental parties, largely because of the aggressive interference of Oura, the Home Minister, the backing of a business clan and the sympathetic campaign conducted by the faculty and students of Waseda University, which had been founded by Okuma. The Doshikai gained 150 seats in the House of Representatives against 104 of the Seiyukai, which was reduced to half its former number. But the latter stubbornly attacked the Government on Oura's interference with the election and other matters, and compelled Oura to leave the Cabinet by bringing a public suit against him.

Digitized by Google

Okuma once tendered his resignation to the Throne in relation to this matter, but was asked to stay at his post and reorganize the Cabinet on July 30, 1915, thereby prolonging its existence for three months.

The Rice Riots At this time the Kenseikai was organized under Takaaki (Komei) Kato by the combination of the Doshikai Party, the Koyu Club, and the Chuseikai on Oct. 10, 1915, in the expectation of organizing the next cabinet. But Masataké (Seiki) Terauchi was recommended instead, and he again formed a transcendental government, a sort of off-shoot of the old Choshu clan; he soon met with a vote of non-confidence by the Lower House, and the 38th session was instantly dissolved. After the general election the Terauchi Cabinet got the support of the Seiyukai and the Nationalist Party and managed to get through the 39th and 40th sessions without damage to the Government. But the general cost of living shot up to unreasonable heights owing to the vast increase of capitalistic business during the World War, and the artificial rise in the price of rice caused nation-wide rice riots in August, 1918, and the riots shook the foundation of the Cabinet, so that Terauchi was forced to resign on Sept. 21.

Formation of Party Government

Among the five Genro, Inouyé and Oyama, who had been the commander of armies at the time of the Russo-Japanese War, had died, and Yamagata, Matsukata and Saionji were the only ones left now, and they chose Saionji, the youngest, to be the next Premier. The Emperor requested Saionji to form a cabinet, but he was clever enough to see the progress of democracy among the people and courteously declined the Imperial appointment and recommended Hara instead. Yamagata finally yielded and gave his consent to this decision, but asked Hara to form a coalition cabinet of the Seiyukai and the bureaucrats.

The First Party Cabinet Hara rejected his suggestion and for the first time in Japanese party history a cabinet was organized by party men only, except for two or three ministers who were mostly pro-Seiyukai.

As was mentioned above, the political parties of Japan were originated by the statesmen of the samurai class and had much of the bureaucratic element in themselves, and the clan statesmen had the confidence of the Imperial Court and wielded real power in general politics as a matter of fact, regardless of the public opinion represented and expressed by the political parties or through the press. Up to the first half of the Taisho Era the political parties could not make much progress as independent bodies, and were almost always made use of by the clan statesmen or military leaders, not having enough power of their own to form a party cabinet, but allowing themselves to become tools of bureaucracy even when the head of the party himself organized a cabinet. But the remarkable development of capitalism and rapid progress of democratic thought among the people at the time of the World War and afterwards caused a decline in the power of the bureaucrats. The coming of Hara, President of the Seiyukai, who was a commoner, into power gave almost the last blow to the old bureaucracy, which gradually faded away by the beginning of the Showa Era.

Hara's Policy The policy of the Hara Cabinet was, in outline, the completion of national defence, the improvement of the educational sys-

Digitized by Google

tem, the promotion of all business and the adjustment of traffic organs. The establishment of the jury system, the improvement and enlargement of the higher educational organs, and the revision of the Election Law must be counted to the credit of this Cabinet. Hara showed his democratic spirit in revising the military governmental system of Taiwan and Chosen so that a civil official might become the Governor-General of a colony. The 41st session passed without much disturbance. But the Seiyukai had not yet an absolute majority and when the anti-cabinet parties proposed the bill of universal suffrage at the following session, Hara took advantage of it and dissolved the Lower House to get his much-wanted majority. The result of the general election held on May 10, 1920, was as follows:

Seiyukai	279	Kokuminto	29
Kenseikai	108	Neutrals	48

Hara was able to do as he pleased, for he again had the support of the great Seiyukai, and pushing aside all opposition from his political foes he was advancing brilliantly toward the completion of the said policies when he fell a victim to the dagger of a young assassin at Tokyo Station on Nov. 4, 1921. He was succeeded as President of the Seiyukai by Korekiyo Takahashi, who organized his Cabinet after the incident, but it was short-lived and was compelled to resign within 6 months. The Seiyukai had troubles among themselves, while the other great party, the Kenseikai, was rather weak so that bureaucratic cabinets were organized one after another for about three years. When Count Kiyoura formed his bureaucratic Cabinet in Jan., 1824, the Seiyukai was divided into two on the question of supporting or not supporting the new cabinet, and the majority of its members who were pro-cabinet seceded from the Seiyukai and organized the Seiyu-honto under the leadership of Yamamoto, Motoda, Nakahashi and Tokonami.

The General Election of 1924 The Kiyoura Cabinet dissolved the 48th session of the Imperial Diet and at the general election which was held in May, 1924, the opposition parties, namely, the Kenseikai, and the Kakushin Club stood up against the Government rallying their forces in defence of parliamentarism, and under Premier Kato who was the head of the then largest party, the Kenseikai, a coalition cabinet of the three parties was realized. This was the death-blow to the bureaucracy of Japan; the clan chieftains and bureaucrats entirely lost their power as a political class and the bourgeois parties completely took their place, the final blow being the passing of the Universal Suffrage Law at the 50th session of the Diet.

Universal Suffrage

The 50th session of the Diet was convoked on Dec. 25, 1924, and it became a memorable one by passing the Universal Suffrage Bill. The demand for universal suffrage had a long history, but it seemed impossible to realize it as long as bureaucracy had its iron grip on all such questions. But the time had come for the mass of the people to voice their convictions on politics with freedom. This time the Government itself drafted the bill and it was first subjected to the examination of the Privy Council. The conservative Council advised revisions and the Government sent it to the House of Representatives which passed the original bill of the Government and sent it to the House of Peers. The latter House could not directly oppose it, but passed it with amendments on weighty points pretty nearly to the same degree as

Digitized by Google

those of the Privy Council. The consultations between the two Houses were repeated, and the Universal Suffrage Bill was passed, to come into force on May 5 of the same year. The antagonistic attitude of the House of Peers toward universal suffrage resulted in a revision of the House of Peers Law to the effect that the number of Kazoku or noblemen among its members was decreased.

Side by side with the accession of the bourgeois parties to power, there broke out many political movements of radicals and proletarians in the form of political parties (see the following articles on these parties). Radicals among the existing parties organized their own party, the Kakushin Club, mentioned above, in Nov., 1922, by the combination of the group of Ozaki, Shimada and their comrades who had left the Kenseikai, with the Nationalists' Party which was led by Inukai, and one other group. But in May, 1925, it broke up, and Inukai and his colleagues joined the Seiyukai. Later the Kakushin Club dwindled into a very small party, although it played an important part in the doings of the Imperial Diet.

There was another movement organized by business men under the leadership of Sanji Muto in April, 1923, but this party was unable to get much sympathy from the general public.

Tanaka to Hamaguchi Viscount Takahashi resigned the Presidency of the Seiyukai and General Baron Tanaka was called from outside to succeed him in April, 1925. This change broke up the unity of the Coalition Cabinet of the three parties mentioned above, and it was forced to give up office. It was followed by a Kenseikai Cabinet under Premier Kato in August of the same year. The Premier fell ill and died, and Wakatsuki, the new President of the Kenseikai was ordered to form a cabinet in January, 1926. Tokonami, who led the Seiyu-honto, took a very ambiguous attitude toward the other parties, but finally joined Wakatsuki and the two parties became one on June 1, 1927, assuming the new name of Minseito. Of this new party Hamaguchi became President while Wakatsuki and Tokonami were made advisers.

On the other hand, the Seiyukai began to rally its power gradually under the leadership of Tanaka, inviting Inukai and his comrades and a part of the Seiyu-honto to join them and after the collapse of the Wakatsuki Cabinet in April, 1927, the Tanaka Cabinet came into being. But unsatisfied with the result of the first general election by universal suffrage in 1928, they tried hard to collect as many members as possible from among the neutrals and the Minseito. At the same time, Tokonami, who had lost hope of becoming the head of the new Minseito Party, seceded from it in August of the same year, and afterward, when the Hamaguchi Cabinet was formed in July, 1929, he went back to his old home, the Seiyukai.

In July, 1929, Hamaguchi organized the Minseito Cabinet and his party won an absolute majority in the House of Representatives as the result of the second universal suffrage election in the following year. But on Nov. 14, 1930, Hamaguchi was shot at Tokyo Station, and although he lived another year his wound finally proved fatal and hard times again visited the Minseito. Wakatsuki became its President again and formed a Cabinet in April, 1931.

With retrenchment as its war-cry, the Wakatsuki Cabinet carried out a general reduction of the salaries of officials and tried to make

Digitized by Google

readjustments in the administrative, financial and tax systems, but without success. The Manchurian Incident of Sept. 18, 1931, occurred near Mukden. The Manchurian problem and the relations between Japan and China had been becoming more acute year by year and the Manchurian railway affair called the attention of the world to the impending collision of the two nations. The incident proved a turning-point in the drift of national politics which now headed in a very different direction not only in diplomacy, but also in many home affairs. The Army and Navy took the lead over the Manchurian problem, no doubt, but they could do so only because the people at large sympathized with and supported them. The budget for the fiscal year 1931-1932 could not be made out without floating a national loan or increasing the taxes, which would of course be most unwelcome to the people at large. Rowdiness and riotous struggles in the House of Representatives at the 59th session which was held at the beginning of 1931, greatly lowered the standing of the House in the eyes of the people and the inability of the Imperial Diet to take any decided course of action after the Manchurian Incident brought parliamentary government into discredit with the nation, and this state of affairs much affected the stability of the Wakatsuki Cabinet. In October, 1931, Wakatsuki expressed his wish to resign, and there arose discussions on the wisdom of forming a new cabinet which might combine the forces of the Minseito and Seiyukai. But opinion was divided, and in the end the Wakatsuki Cabinet was forced to resign on December 11.

Inukai and the Embargo Inukai, who became President of the Seiyukai in 1929 after the death of Tanaka, publicly announced his idea of re-imposing the gold embargo at the general meeting of his party on November 10, and the resignation of the Wakatsuki Cabinet, which came immediately after it, therefore, suggested the possibility of something serious taking place in case the choice of the succeeding government was not well made. Saionji, the Genro, laid the nomination of Inukai to the Premiership before the Throne, and on December 13, 1931, the single Seiyukai Cabinet came into power.

The Inukai Cabinet proclaimed the re-imposition of the gold ban on the day following its installation, as had been expected. This Cabinet had a minority in the Lower House, so they intended to dissolve the Diet at the coming session when suitable occasion arose, to seek for an expression of national confidence at the general election, and hastened to make preparations for it. Hardly had a week passed before it changed most of the local governors to those who were favourable to the Seiyukai, because these officials had direct influence over the general election. The new Cabinet had assumed the post but two weeks before the 60th session of the Diet and had no time for planning a budget of its own, it had, therefore, to borrow that of the Wakatsuki Cabinet. It was, nevertheless, presented to the Diet with some changes or revisions, but it failed to be passed because of the dissolution on January 21, 1932.

Previous to this, an unexpected event endangered the life of the Cabinet. It was nothing less than a bomb thrown at the Emperor's procession near the Sakurada Gate of the Palace Grounds and before the headquarters of the Metropolitan Police. The Emperor and an Imperial Prince narrowly escaped injury. This act of "lése majesté" compelled the cabinet to resign, but

Digitized by Google

the Emperor did not ask them to assume responsibility, and encouraged them to continue in office, and Inukai and other members of the Cabinet pledged their patriotism and loyalty to the Throne, in spite of public opinion which was rather against their holding on to the reins of power.

The Seiyukai's Victory The general election of Feb. 20th was carried out amidst the apparent apathy of the people at large because their attention was absorbed by the Manchurian problem and the events in Shanghai which seemed to be impelling the nation towards international discord, with war as a final outcome. But the result was that the Seiyukai, the government party, piled up the grand majority of 304 while the Minseito dwindled to 146.

The Seiyukai Cabinet, which had gained the absolute majority in the House of Representatives, was to call an extraordinary session of the Diet in March to decide upon the emergency military expenses.

The May 15 Affair In the meantime, the new State of Manchoukuo was born, and the activities of international diplomacy helped to solve the complications in Shanghai, warfare there being terminated by mutual agreement. But Japan's international relations became strained and the world's attitude toward Japan, due to her persistence in military actions, became, reasonably or not, increasingly unfavourable, which reacted badly on the Inukai Government. The financial condition held out little hope for the business world, and the Government was unable to make any positive plans for the present and future of the public welfare. On the other hand, the general social and political unrest, and the discredit brought on parliamentary government helped the rapid growth of national socialistic thought in the minds of the people, and the organization of various Fascist associations among the hot-heads, both young and old. The repeated assassinations disturbed the public mind to the last extreme, and alarming rumours spread from the metropolis to the remotest parts of the Empire. The veteran statesman Inukai, the Premier, was eager to protect parliamentarism by making a thorough improvement of the political parties and realizing an even distribution of political benefits among the people in general instead of a partial accumulation of it in the hands of privileged classes. But the younger elements of the nation were too hasty-tempered to place reliance in his words and idealism, and on the evening of May 15, 1932, a dozen young cadets and officers of the Imperial Army and Navy armed with pistols broke into his official residence at Nagata-cho, Tokyo, and finding him in his Japanese sitting room pointed their weapons at him. "Wait a moment," said Inukai quietly. "Let us talk things over and you will understand my ideas." But without answering a word they fired, and the Premier fell. At the same time another band of young farmers attacked the transformer stations in the suburbs with intent to throw the city into darkness, but they were caught before they could carry it out. (See page 170.)

The Saito Cabinet Consequently the Cabinet, having lost its head, immediately tendered its resignation to the Throne. Saionji recommended Viscount Saito to the Throne after a thorough consultation with such experienced statesmen as might well be called vice-Genro. The Saito Cabinet was composed of five bureaucrats, three representatives of the House of Peers, three Seiyukai members, and two Minseito members,

Digitized by Google

so that it was called a "National Cabinet."

At its second extraordinary session in 1932, the Imperial Diet passed the most important resolutions on the relief of the financial hardship of farmers and the recognition of the new state Manchoukuo. The latter was carried out in spite of obstacles, visible or otherwise, and to carry out the former decision a vast amount of money was needed in order to give substantial aid to the hard-stricken farmers, with their debt of ¥6,000,000,000.

Strength of Political Parties The present strength of each political party may be roughly shown in the following table, which gives the results of the 18th general election in February 1932, the third since universal manhood suffrage was adopted.

Parties	Candidates	Elected	Before Dissolution	Increase or Decrease

The Kokumin Domei was organized on Dec. 22, 1932, under President Adachi, and announced itself as a non-governmental party.

The 64th Session of the Diet The 64th session of the Imperial Diet was convened on Dec. 24, 1932, with the following line-up in the Houses:

House of Peers:	
(Number of members, 402, vacancies 4)	
Imperial Princes	18
Kenkyukai	148
Koseikai	69
Dowakai	41
Koyu Club	40
Kayokai	34
Doscikai	15
Independents	37
House of Representatives:	
(Number of members, 459, vacancies 7)	
Seiyukai	298
Minseito	116
Kokumin-Domei	32
Proletarian Parties, etc.	13

This session closed on March 25, 1933. It was a peaceful or rather monotonous one, and passed the

Digitized by Google

budget of over ₹2,300,000,000 without a single cut, and 51 of the 53 bills proposed by the Government and 7 of the 97 bills proposed by the members of the Diet. Among those passed, there were such important laws as the Farmer-Village Debt Readjustment Law, a law for the relief of the people of Tohoku district who had suffered from the recent earthquake and tidal waves, the Child Ill-treatment Prevention Law, the Juvenile Protection Law, and the revision of the Iron-manufacture Promotion Law which meant the union of all the largest iron-manufacturing works.

Political Movement of the Proletariat

There were frequent outbreaks of rice riots in the days of the Tokugawa Shogunate. But the samurai class was above the farmers and artisans, who had neither political power nor military force.

Labour Movement Takes Shape When modern commerce and industry were introduced to Japan in the Meiji Era and capitalism began to have sway over the working people, labour movements became active as a matter of course.

On the 1st of December, 1897, the Iron Workers' Union was organized in Tokyo with over one thousand members, and this was the first trade union in Japan.

Public Peace Police Law In 1900 the Imperial Diet passed a bill and enacted it into a law. The law was entitled the Public Peace Police Law. It proved to be the death knell to all phases of the labour movement, preventing the working classes from organizing themselves into unions. The law practically prohibited the industrial working classes as well as the tenant farmers from agitating in their own interests and against the employers and land-owners. And later the law was interpreted to mean that all labour movements were a crime.

In 1901, a socialist party was organized which was called the Social Democratic Party, the original members being S. Kotoku, I. Abé, N. Kinoshita, K. Kawakami, K. Nishikawa, and S. Katayama. It was soon suppressed by the authorities and transformed into a non-political organization, namely, the Socialist Association.

Marxism Introduced It was in 1903 that the socialist theory of Marxism was first introduced to the Japanese radicals, and the theory soon attracted large numbers of students. In 1906, the Socialist Party was organized for the second time, and on Feb. 17th, 1907, the first anniversary meeting of the party was held in Tokyo. The resolution at the meeting announced the aims of the party as follows : a radical and fundamental change of the existing society, universal suffrage, anti-militarism and anti-religion. Later the socialists began conflicts and were divided over the question of socialist tactics into two groups, i. e. Marxists and direct actionists. Secret activities of radical socialists and stern suppression of the same by the Government developed more and more desperate tactics on both sides, and the Government finally came by a chance to destroy the entire socialist movement in the bud. They instituted the famous anarchist trial in 1911, in which Kotoku and twenty-three others were condemned as traitors, and he with eleven others suffered the death penalty.

Marxist propaganda and leadership of strikes and even anarchists' movement did not cease with the trial and execution of Kotoku and his comrades. One of the most conspicuous events in the annals of their movement was the death of S.

Digitized by Google

Osugi and his colleagues in the midst of the Great Earthquake commotion in Tokyo at the hands of the reactionaries.

But it must be said that Japanese social movement entered into a new era by the stimulus from the Russian Revolution in 1917 and its later development.

The Labour-Farmer Party The suppression of the Nippon Socialist Party in 1907 and the stern policy of the Government against socialist movements made the Japanese proletariat suffer and grope in the dark for the next decade.

In June, 1924, a society was established for the study of politics to prepare for the organization of a proletarian party. And by the proposal of the Japan Farmers' Union the first national proletarian party was organized on Oct. 1st, 1925, and it was called the Farmer-Labour Party. But this party met the Government's order of suppression on the very day of its organization because of its communistic elements. Thereupon, the left-wing elements were expelled and right-wing elements in the shape of the Japan Federation of Labour, were added, and in March, 1926, the Labour-Farmer Party was formed, with Mr. Motojiro Sugiyama as its president.

Schism in Proletarian Parties The Labour-Farmer Party soon became a nest of quarrelling cliques, and the question of opening the door to communistic elements gave a motive for the secession of the Japan Federation of Labour and the right leaders Iso-o Abé, Toyohiko Kagawa, etc., who established the Social Democratic Party with the Federation as its main element and Abé as its President on December 5, 1926. The new party rejected communism and insisted upon parliamentarism as a pure social-democratic party.

Contemporaneous with the formation of the Social Democrats, the left-wing elements of the Japan Federation of Labour and the right-wing elements of the Japan Farmers' Union organized the Japan Labour-Farmer Party under the leadership of Hisashi Aso-o on December 9, 1926, insisting upon the establishment of a right road for the proletarian movement.

The Labour-Farmer Party, which was stripped of half its force by the continuous secession of the right-wing elements, made Ikuo Ohyama its head and opened its doors to the communistic societies. The result was that it was practically led by the Japan Communists and played the part of a legitimate communistic party; and it was compelled to dissolve on the 10th of April, 1928, being suppressed by the Tanaka Cabinet after the wholesale arrest of the Japan Communists on the 15th of March of the same year.

The old leaders of the dissolved Labour-Farmer Party organized a preparatory society for the establishment of a new party and endeavoured to realize their plan, but always met with the pressure of the authorities, and finally organized the Proletarian People's Party under the theoretical leadership of Hitoshi Yamakawa.

Their Union In the meantime, the right-wing elements of the Japan Union of Farmers organized the Japan Farmer Party with the idea of establishing a representative Japanese party of farmers under the slogan, "Farmers come to the Party of Farmers", on October 17, 1926, and there arose many small local proletarian societies or parties in different districts.

Such rivalry and disunion among proletarian parties naturally called forth a demand for the unification of fighting lines, and the parties, which kept to the middle way, like

Digitized by Google

the Japan Labour-Farmer Party, the Japan Farmer-Labour Party and the General Proletarian Party, which were the three national proletarian parties, and the Proletarian Constitutional Party, the People's Party in the central district and two other local parties were all united into one and organized the Japan Mass Party.

The General Proletarian Party organized an anti-separation union and protested against the leaders of the Japan Mass Party, but they themselves were soon dissolved into the Tokyo Proletarian Party for the Masses and other local proletarian parties.

The leaders of the former Labour-Farmer Party, who had formed a preparatory society for the establishment of a new party just after the dissolution of their party, continued their movement for its reconstruction, but their project was prohibited half-way, and the preparatory society itself was ordered to close. They were thus compelled to organize a labour-farmer union, an illegitimate body, for obtaining political freedom and did not cease to follow a communistic policy. But they were involved in the wholesale raids on the Japan Communists on March 15, 1928, and April 16, 1929, in which the ablest radical leaders were accused of being members of the Communistic Party and were mostly arrested so that their movement came to an end. The leaders who escaped the raid such as Ikuo Ohyama and Hajimé Kawakami organized a Labour-Farmer Party on November 1, 1929. The purpose of their new movement was to proclaim the need of obtaining the right of public activity as a lawful left-wing party by establishing a standing political organization.

While the left and midway parties had been continually combining and re-dissolving, the right-wing party of the proletariat or the Social Democratic Party alone developed without a hitch for some time, but in Sept., 1929, the Osaka Union of the Japan Federation of Labour, the main element of the party, separated from the federation and consequently withdrew from the party and established the National Democratic Party on January 15, 1930. But this party was united with the Japan Mass Party on the 20th of July of the same year and formed the National Mass Party.

The N. L. F. Mass Party The movement for the greater union of the proletarian parties was continued and the Society for the Realization of Unity of Proletarian Parties, which was a bloc of those who insisted on the unconditional union among the members of the National Mass Party, the Labour-Farmer Party and the Social Democratic Party, organized the National Labour-Farmer Mass Party on the 5th of July, 1931. In this new party there was no head of the central executive committee, but Hisashi Aso-o, President of the former National Mass Party, was appointed to the chair of the chief secretary, who also served as Acting President. Ikuo Ohyama, President of the former Labour-Farmer Party, retired from all official positions and went abroad. This National Labour-Farmer Mass Party stood between the extreme left and right, but the inner control gradually became loose and Hajimé Kawakami and Kanemitsu Hososeko were expelled along with some other members. These two were arrested as strong sympathizers with the Japan Communists.

Social Mass Party In 1931, the National-Socialist movement suddenly appeared on the surface of the sea of social unrest, and the tide of Fascism began to permeate the

Digitized by Google

proletarian fighting lines ; the right-wing of the legitimate proletarian parties turned toward National Socialism. On the other hand, the left-wing was influenced by the Japan Communists, who never ceased their secret movements in spite of the constant interference of the authorities, and the power of the proletarian parties was greatly reduced. This state of affairs induced another union, and on the 24th of July, 1931, the Social Mass Party was organized by the union of the Social Democratic Party and the National Labour-Farmer Mass Party. This new party elected Iso-o Abé, Chairman of the Central Executive Committee ; and Hisashi Aso-o, Chief Secretary. The platform of the party was as follows :

(1) We will fight for the protection of the lives of the labour, farmer, and general working masses.

(2) We aim at the destruction of capitalism and the emancipation of the proletariat.

And this new party is acting as a social democratic party, rejecting both Communism and Fascism.

Universal Suffrage and Proletariats Since the birth of proletarian political parties with the purpose of sending representatives to the Diet, there have been three general elections. The latest campaign was at the third general election which was held on February 20, 1932, under the Inukai Cabinet in consequence of the dissolution of the Diet at the 60th session in the previous month. In this election, the proletarian parties made plans for fighting against capitalistic parties, from their past experiences and on the basis of their characteristic principles and policies, and sending out 36 candidates, fought bravely with public speeches as their only weapon. The result was 5 members elected, with the gain of 290,979 votes. To make a comparison with the former elections, the number of successful candidates on the first occasion was 8 or 3 more, and on the second one it was 5 or the same number as at the last, while in the number of votes they lost at the third election 201,242, compared with the first one, and 207,242, compared with the second one. But the number of the candidates was much smaller than the previous ones, so that the number of votes per capita increased to 8,083 from 5,593 of the first and 5,475 of the second election, or every proletarian candidate at the latest election gained about 3,000 more votes than at the previous two general elections.

Decrease in Candidates The reason of the decrease in the number of candidates at the third general election may be sought in the long financial depression the country over, and especially in the extreme poverty of the farming villages which caused difficulty in raising funds for the campaign. And the reasons of defeat may be counted as follows :

(1) The rivalry among the proletarian parties themselves in the same field of campaign.

(2) The defects in the system of the proletarian parties and the weakness of their influence on their constituencies.

(3) The lack of appeal of the proletarian parties for the unorganized mass of people.

(4) The inconveniences of the existing election laws for the proletarian parties.

The following table shows a comparison of the results of the three campaigns conducted by the proletarian parties :

Feb., 1928	Candidates	Elected	Votes Cast

The National Socialists

Orientation to National Socialism In 1931 the Labour Union established the Japan Labour Club with the purpose of realizing a great union of the right wing. Stimulated by the supremacy of Fascism in Italy and the Fascisti movement of the Nazis in Germany, there appeared a movement for National Socialism among the members of the Social Democratic Party. Besides, after the Manchurian Incident the atmosphere among the Japanese people was very suitable for the growth of nationalism and patriotism, and the national socialistic section of the Party increased their power under the leadership of K. Akamatsu, chief secretary, and R. Hirano.

Their Platform At the same time, National Socialism began to make its mark among the members of the National Labour-Farmer Mass Party, which kept to the middle way, and especially it gained power among the members who belonged to the National Labour Union, the strongest supporter of the party. Some powerful leaders of the National Labour Union moved for the establishment of a National Socialistic Party, but their motion was rejected by the party and they seceded from it in one body. The seceders met with those from the Social Democrats, and, on the 29th of May, they established the Japan National Socialist Party with K. Akamatsu at its head.

Activities of the Old Nationalists

The rise of the nationalistic tide, which coaxed the proletariat partisans away, correlatively gave inspiration to the activities of the old nationalists, and their leading principles began to take national socialistic colour in compliance with the change of the social state of affairs.

The Production Party The Great Nippon Production Party, an extreme right-wing party, which had hailed Japanese nationalism but vaguely, showed a sudden activity and absorbed the Nippon Nationalists, the Radical Patriots and other parties of similar nature at the end of 1931. Their aims are the reconstruction of anti-nationalistic institutions, according to the fundamental national spirit of Japan.

The Jimmu-kai On February 11, 1932, the anniversary of the Foundation of the Empire, the Jimmu-kai, a strong nationalists' society, was organized. The central element of the society was the Ko-chi Sha of Dr. Shumei Ohkawa, who had intimate connections with military men, and the new party was also helped by Hiroichiro Ishihara, a business man, Daisaku Komoto, a colonel, and the like. At the general election of 1932, rallying the young members of the Ko-chi Sha, the Great Nippon Production Party and other Nationalistic bodies, they sent out bands on a canvassing tour over the whole country for the propaganda of Nipponism, and put advertisements denouncing the existing political parties in all the leading newspapers. It is said that they gained over 50,000 new members in

Digitized by Google

a month or so of the campaign.

Super-legal Movements of the Rights In addition to the national commotion arising from the Manchurian Incident, the failure of the crops in the north-eastern districts dealt a heavy blow to the poor villagers groaning under financial depression, and the problem of finding some means of relieving the people in the emergency became so acute that no time was to be lost. This nation-wide suffering and anxiety urged the right-wing movement to proceed to extremities, and they passed far beyond the limits of lawful action. In the midst of the election campaign, on February 9, 1932, Junnosuké Inouyé, ex-Minister of Finance, was shot to death by a young man, Konuma, of the Blood Brotherhood League headed by Nissho Inouyé, a priest of the Nichiren sect. On March 5, Takuma Dan, Chairman of the Board of Trustees of the Mitsui Company and one of the ablest contemporary business men, was assassinated by Hishinuma, a member of the same secret association. At 5:30 in the afternoon of the 15th of May, Premier Inukai, was killed. This was the so-called "5:15 Affair" as it occurred on the fifteenth of the fifth month, 1932. The after-claps of the event appeared in the secret plots of Dr. Imamaki, adviser to the Jimmu-Kai, in the middle of August, and of the Tenko-Kai and the Independent Young Men's Association in November, and finally at the arrest of Dr. Shumei Ohkawa, head of the Jimmu-Kai and the Far Eastern Economic Research Bureau. With the May 15 Affair, Japanese Fascism reached its climax.

Later investigations showed that those directly connected with the affair were 10 young Navy officers, 11 students of the Military Academy and 21 farmers and scholars. After the arrest of members of the Blood Brotherhood League formed by Nisho Inouyé, who entertained a plan to kill representative men one by one, his comrades undertook the continuation of the work. Lieutenant Hitoshi Fujii a leader, had died in the battle at Shanghai on February 5, 1932, but had left a strong influence among his friends. Second lieutenants Kiyoshi Koga and Yoshio Nakamura, who belonged to the Kasumigaura airship corps, began to form bands with a view to bringing about a new government with the military as the central force, in plunging Tokyo into a state of siege by their sudden attack upon the capital. In the plot they were soon united by Kozaburo Tachibana, head of the Aikyo Juku (Village Loving School) of Ibaraki prefecture, and a leader of agricultural movement. Dr. Shumei Okawa, Hidezo Toyama, head of the Tenko-kai, and Kenichiro Homma also came to their help and, moreover, supplied them with necessary funds and arms. At 5:30 p. m. May 15, 1932, four bands composed of military officers and cadets armed with pistols, attacked several points of the capital and killed Inukai and others as mentioned above, while another band of farmers attempted to break into the transformer stations to throw the capital into darkness. Most of them were arrested on the day and the sentences for all of them (except one farmer who died in the meantime) were passed by February, 1934, the heaviest penalty given being imprisonment for life for Kozaburo Tachibana, but none of them were sentenced to death.

The Farmer-Central Movement As a result of the May 15 Affair the Saito Cabinet was organized. The new Government called the second Emergency Session of the Diet in June and the third one in August, and the Diet passed the "Resolution

Digitized by Google

for the Relief of the Economical Depression", for the purpose of relieving the impoverished villages of the farmers. The motive power of this action of the Imperial Diet was the Farmer-Central Movement of the Self-governing Farmers' Council and its sympathizers which became an incentive to the petition movement for the rescue of the peasant villages from the ruin which threatened them.

The Self-governing Farmers' Council is led by the farmer-central idea of Mr. N. Gondo, and rejecting both the strikes of farmers and national socialism, it endeavours to realize a farmer-central government with the harmonious co-operation of the ruling class and the people, putting the landowners, the landed farmers and the tenant farmers into one. The Council was organized by the association of the Nagano-Prefecture Japan Farmers' Association, the Emancipation Society, Mr. K. Tachibana, the head of the Aikyo Juku, (Village Loving School) and Mr. R. Nagano of the Japan Village Government Union, which was established in 1931, with him as its moving spirit.

Communist Movements

The fundamental idea of the socialistic movement in Japan is Marxism.

The Nippon Communist Society was apparently broken up by the wholesale raids of 1914 and 1915, and the members who then escaped arrest hid themselves deep in the bottom of society, and secretly continued their endeavours to reconstruct it. But the leaders of the new society, which they organized in 1927, were all arrested on the 16th April, 1928, and the remaining members had a hard time to accomplish the work under the constant oppression of the authorities, and the society showed its activity before the public at the general election of 1931. It was for the third time scattered by the iron hand of the Government after February, 1931, but it continued its secret activities by the order of the International Headquarters with the side or sub-divisions of the communists.

The Japan Communist Society Its activities are carried on secretly and the Government prohibits its propaganda whether by speeches or the press, so it is difficult to know of its real nature. But it is understood that its power and influence are on the increase in spite of the constant arrest of its members. Its slogan of 1932 was "the reconstruction and enlargement of the Society and its popularization." It aims at and works for the abolition of parliamentary government, the destruction or revision of capitalistic control of industry and reactionary labour laws, the relief of international unemployment, the improvement of all labour managements, the betterment of the conditions and privileges of women, the abolition or lightening of the penalties imposed upon communists, and its propaganda among the factory workers and the people at large.

The Kopf[1] This federation of proletarian artists was organized in November, 1932, and it works for the education of labourers, farmers and other workers in politics and economy, the improvement of the labourer's living, the establishment of proletarian civilization on Lenin-Marxism, the freedom of speech, publication, exhibition, drama, movies, and broadcasting, the creation of cultural institutions for labourers and all workers.

Political Affairs in 1933-34

On January 8th Admiral Okada, Minister of Marine, resigned and the portfolio was given to Admiral Minéo Osumi.

The 64th session of the Diet came to an end on March 25, after passing the 1933-34 budget, of over ¥2,300,000,000, and 58 bills. Among the latter there were such important laws as the Farmer-Village Debt Readjustment Law, the Relief Law for Tohoku district, the Child Ill-treatment Prevention Law, the Juvenile Protection Law, the Rice Control Law and the Iron-Manufacture Promotion Law.

In the meantime, Shibata, Chief Secretary of the Cabinet, resigned and was succeeded by Zenjiro Horikiri. Ikki, Minister of the Imperial Household, also resigned and was succeeded by Kurahei Yuasa.

On March 27 Japan served notice to withdraw from the League of Nations to which she had made valuable contributions for over 12 years (see Chapter VI).

Immediately after the close of the Diet the Saito Cabinet was confronted with the question of "red" judges in the Court, and a committee on thought problems was organized in the Government.

Another difficulty arose in connection with the expressed desire of Takahashi to resign from his post as Finance Minister. The difficulty was increased by the manœuvres of the Seiyukai to come into power. But the disquieting rumour about the probable appearance of a Fascisti government, was put in order by Saito's success in keeping Takahashi to his Cabinet.

The year also witnessed a decided decline of the left wing socialistic parties, especially the communists, many of the leaders leaving the camp and dropping their activities.

In September Uchida, Minister of Foreign Affairs, retired and Koki Hirota was called to fill the position.

The Government met unusual difficulties in making out the Budget for 1934-35, because of military expenses and the farmer relief funds, and was compelled to face the 65th session of the Diet, with a very unsatisfactory Budget of over ¥2,120,000,000.

The happiest event of the year was the birth of the Crown Prince Akihito on December 23. (For international events of the year consult the last pages of Chapter VI.)

65th Session On December 23, 1933, the 65th Session of the Imperial Diet was convened and after the customary recess for the New Year's holiday, resumed its work on January 23, 1934.

Foreign Policy Foreign Minister Hirota enlarged upon a firm policy to be followed for the strengthening of the world peace, referring in this to Japan's withdrawal from the League of Nations and the Imperial Rescript issued on that occasion. He dwelt on the intimate relations between Japan and Manchoukuo, expressed the great necessity for China to work out her own salvation and hopes for the quick rectification of the relations between Japan and China. On the relation with the U.S.S.R. he regretted that its unwarranted criticism was directed against Japan, but maintained hope that the Soviet Union would soon come to appreciate the true intentions of Japan and the North Manchuria Railway negotiations would be resumed. On the relation with the United States of America he said that there was no question existing between the two nations which was intrinsically difficult of solution, and earnestly desired that they would continue in cultivating their historical friendship and good understanding, which

Digitized by Google

is too tenacious to be broken even by such a question as the Manchurian Incident. Concerning England and Japan, Hirota stated that the traditional amity between them remained unshaken and that the Japanese Government were seeking to readjust whatever conflict of interests there might arise between the two countries relating to questions of trade. He did not deny the fact that Japan's foreign relations were beset with serious problems, but expressed his firm conviction that things would amend in time. Finally he stated that Japan's national defence was solely for defensive and self-protective purposes.

The Budget Finance Minister Takahashi presented the 1934-35 budget, which amounted to ¥2,112,000,000 (¥8,000,000 less than the previous year), of which ¥1,248,000,000 was to be met with by the ordinary income, ¥19,000,000 to be covered by the balance of the previous year, and ¥785,000,000 to be obtained from loans. Of the ¥785,000,000 loan, ¥606,000,000 was for covering the deficit. (See Chapter VIII.)

Then the following four days were spent for interpellations. Contrary to the general expectation that the political parties would be quiet as they had been in the last session, their attitude toward the Government and the Military Ministers was rather aggressive. Takejiro Tokonami of the Seiyukai and Chuji Machida of the Minseito emphasized the importance of the constitutional and parliamentary political system and criticized the Fascisti treason reported to exist in certain quarters. Open attacks against the tendency of military men to meddle with politics drew out earnest explanations from military authorities. It was patent, however, that neither the enquirers nor the explainers had no ulterior motives, but they were actuated by a spirit of patriotism.

Discussions on the 1934-35 Budget continued from January 26 to February 4, and on February 13 the House of Representatives passed it by unanimous vote without amendments. The discussion mainly turned upon the issuance of Government loans, the military expenses, the need of establishing a definite financial plan for the future, and the increase of taxes. As to the last point, Takahashi disclosed his decision to increase taxes at a most convenient time.

The problems of farmers, smaller merchants and industrials were discussed by many members, who urged the Government to take more definite and positive measures for the control of rice (last year's crop reaching the excessive amount of 78,000,000 koku), and silk business.

Dissatisfaction with the outcome of the Simla Conference was expressed and acquiesced in by the Foreign Minister, but, as a whole, his answers gained confidence in the Government's policy.

On March 14 the Budget passed the House of Peers without amendment. (See Chapter VIII.) But the amount of the expenses voted for the relief of the farmers was meager and by the request of the Diet, the Government presented an additional budget for the purpose amounting to ¥20,990,000 for Japan proper and ¥8,200,000 for Korea, which passed the Diet as a matter of course.

Difficulties arose on the Revision of the Election Law because of the amendments made by the House of Representatives, and after a joint session of the two Houses, it was finally passed with important amendments on March 25.

On March 26 the 65th Session of the Diet adjourned, passing the bud-

Digitized by Google

get for the fiscal year 1934-35 and 50 laws.

Political Affairs in 1934-35

The Privy Council President Changes On May 2, 1934, Prince Saionji, the Genro, entered his Tokyo residence at Surugadai and the political world grew tense with expectancy and the general public expected something important to take place. Seiyukai and Minseito were reconciled as preparation for regaining their long-lost power in anticipation of the resignation of the Saito Cabinet.

But the irony was that the nomination of Baron Kitokuro Ikki to the Presidency of the Privy Council took place on the following day, which re-inforced the Cabinet rather than weakened it. The prevailing custom was to promote the vice-president at the resignation of the President of the Privy Council and thus Baron Kiichiro Hiranuma was naturally expected to succeed Kuratomi, who tendered his resignation on April 25. But fact belied the expectation and Ikki, an outsider, was nominated to the post.

The first reason of Ikki's choice was evidently the fact that Hiranuma was connected with Kokuhonsha, a nationalistic group. Another reason has evidently to do with the function of Genro. Prince Saionji, the only Genro living, nearly 90 years old and a break in the office of the Genro must not be allowed to take place. The Lord Keeper of the Imperial Seals, the Minister of the Imperial Household and the President of Privy Council, who are most intimately related to the Throne are most likely persons to be in position to advise the Throne in the matter of forming a cabinet and the choice of Ikki was evidently made by keeping this point in mind.

The Saito Cabinet Resigns The detention on May 19 of Hideo Kuroda, the Vice-minister of Finance, on charges connected with the Teikoku Rayon scandal was sufficient reason for the resignation of the Saito Cabinet. This was a matter of political common sense. But on the other hand, the charge partook somewhat of a political nature and it was considered unwise to tender resignation hurriedly. So the resignation was delayed, but the development of the case and outburst of other cases to the disadvantage of the Cabinet finally compelled Premier Saito to tender resignation to the Emperor on July 3, 1934. The new cabinet with Admiral Keisuké Okada as Premier came to power on the 8th of the same month.

The Okada Cabinet The Okada Cabinet is virtually the continuation of the Saito Cabinet. It is a non-party cabinet, as was the Saito Cabinet, and has likewise the tiding-over of the crisis years as its objective. The first plan of the cabinet making was to exclude party men, but later it was changed, due to difficulties which such cabinet would probably meet. Thus it was finally composed of seven men out of officialdom and five party men (2 from the Minseito and 3 from the Seiyukai). The Seiyukai had turned down Okada's invitation to join his cabinet and three of its members became ministers in the new Cabinet, it forthwith announced their expulsion from the Seiyukai.

Farm-village Problem By the end of October, 1934, the National Treasury disbursed approximately ¥300,000,000 for the relief of farm-villages. This means that the yearly disbursement is approximately ¥100,000,000, and, when left alone, it will necessitate increased taxation. The relief of farm-villages has thus assumed the position of an important factor in national finance.

Digitized by Google

The impending questions which have to be solved are how to dispose of the stock of rice and how to restrict the over production so as to increase farmers' income by higher prices. The solution of the questions is complicated by the fact that over a half of the farmers can hardly afford to consume rice which they themselves raised because of the high price. A famine of rice, therefore, takes place.

In order to cope with the situation, though partially, it was decided at the 65th session of the Diet to increase the fund for purchasing surplus rice, and also the Government promised to find out more effective means to meet the situation. Under the Okada Cabinet a committee was appointed for the study of the problem from among the members of both Houses and also private persons. The Seiyukai and Minseito were also united in organizing a committee for drafting a more effective law dealing with the problems.

Three possible ways of solving the question are in view: the governmental control, self-control and monopoly by the Government. Each plan, however, has its own obstacle and in order to carry any one of them out is no easy matter.

Extraordinary Session and After The Okada Cabinet at first took a lukewarm attitude towards convening an extraordinary session of the Diet in spite of the resolution passed at the last session under the Saito administration and the strong demand on the part of the Seiyukai, which is essentially a farm party. But an unexpected event compelled the Government to give heed to the above demand. A damage greatest since 1923 was sustained in the Kansai district and central Japan by the typhoon of September 21, 1934. The year 1934 was also a very unfavourable one for farmers. An untimely cold weather checked the growth of rice plants in the northeastern districts and Hokkaido, precipitation was scanty in Shikoku and Kyushu islands, and the southwestern half of the country was visited by the typhoon just mentioned. An immediate relief of farmers thus became a national necessity, and on September 28 the Government decided to convene an extraordinary session by December.

The 66th Session An extraordinary session of the Diet was, therefore, convened on November 27 and closed on December 10. The main objective of the session was the relief of the sufferers in a variety of natural calamities in the year. The budget for the relief was as follows:

Year of disbursement	Amount (in ¥1,000)
1934–5	70,664
1935–6	68,318
1936–and after	74,957
Total	213,940

The budget passed both Houses without amendment, though it was attacked as being too small to meet the need, specially by the Seiyukai. Among other things which gave rise to hot discussions were the War Ministry's pamphlet, entitled "On the True National Defence and its Reenforcement," the disturbance among the Kwantung Government officials in connection with the organization of Japanese military and civil organs in Manchoukuo, and the charge on maltreatment of the suspected persons in relation to the Teikoku Rayon scandal.

The session, however, closed without giving any material harm to the Government, except the so-called "Bakudan Dōgi", or "bomb" motion, thrown on December 5 by T. Azuma of the Seiyukai demanding an increase of ¥180,000,000 in the relief appropriation.

The "bomb" took the Government

Digitized by Google

and the people by surprise and the dissolution of the Diet was seriously talked about. But Okada's vague promise to give consideration to the increase when the Government thought it necessary, settled the matter for the time being, leaving the final solution to the regular session of the Diet.

Naturally the interval between the 66th and 67th sessions was a period of much political speculation and gossip was rather rampant in regard to the relations between the Government and the Seiyukai, and also to the possibility of dissolution. The two Houses were composed of the following :

THE HOUSE OF REPRESENTATIVES
(November 25, 1934)

Seiyukai	264
Minseito	118
Kokumin Domei	31
Tokonami and followers, Proletariats and others	27
Vacant seats	26
Total	466

THE HOUSE OF PEERS
(November 25, 1934)

Princes of the Blood	18
Kayōkai	41
Kenkyukai	155
Doseikai	23
Dowakai	32
Koseikai	66
Kōyū Club	38
Unaffiliated	36
Vacant seats	3
Total	412

The 67th Session The regular session of the Diet was convened on December 24, 1934, and closed on March 26, 1935. Notwithstanding the expectation generally entertained of a collision between the Government and the Seiyukai on the various questions pending, both sides were, in the final analysis, willing to come down the wall half way and the session was carried on in peace. The peace was, however, an armed peace and the Seiyukai took care that a number of important government bills were killed. The promise which the Government made at the last session in regard to the relief appropriation was made good to the amount of ¥15,000,000, instead of ¥180,000,000, as was originally demanded by the Seiyukai.

The Government, beside the Budget for 1935-1936 (given in full in the chapter on Public Finance and passed without amendment) proposed over 50 bills to the Diet. Of the over 50 bills only 5 passed the Diet and among those shelved there were important bills as Rice Control Law, Cocoon Distribution Law, Manure Control Law, Iron and Steel Tariff Law, and the Regulations of Fishing in the Northern Seas.

The session was enlivened unexpectedly with a discussion in regard to the interpretation of the Constitution. It was in February that a criticism on the exposition of the Constitution by Dr. Tatsukichi Minobé, Emeritus Professor at the Tokyo Imperial University and Professor at the Commercial University, was raised. Dr. Minobé's theory is that the Tennō, the Emperor, is the highest institution of the Empire and against this the assailants stated that the Tennō is the absolute Sovereignty and origin of all laws. The discussion was ended, at least so far as the Houses and the session were concerned, by the promise given by the Government at the initiative of the House of Peers that it would do all to clarify the specific nature of the Japanese State.

CHAPTER VI

FOREIGN RELATIONS

Earlier Contacts with Foreign Countries

China and Korea China and Korea were the first foreign nations to come into contact with Japan. To these two countries the ancient Japanese were indebted in a large measure for various institutions of civilization. It was, however, not until about the middle of the fourth century A. D., when the Empress Jingo sent an expedition to South Korea and established a resident Japanese government in Silla, one of the three Korean kingdoms, that the Japanese began systematically introducing Chinese culture and learning through Korea. After this, Chinese civilization continued to influence the Japanese to an increasing extent, and in 593 the Prince Regent Shotoku began the construction of an imposing Buddhist temple and pagoda at Tennoji (now a section of Osaka). This was intended to help propagate Buddhism among the Japanese as well as to impress the Chinese envoys and traders who, in those days, were in the habit of coming to this country by small sailing craft and landing at what is now known as Osaka.

Other contacts with China and Korea occurred on the occasion of the Korean resistance against the encroachment of the Chinese under the Tang dynasty in the seventh century, when the Emperor Tenchi sent assistance to Korea, and at the time of the invasion of the northern shores of the island of Kyushu by an expeditionary force under Kublai Khan in the thirteenth century, which was the first and last instance of the security of Japan being menaced by foreign invasion. The Mongolian expedition was finally repulsed by the Japanese with the help of a hurricane which wrecked practically all the Mongolian fleet.

Another major event in Japan's earlier foreign relations was the expedition sent to Korea by Hideyoshi Toyotomi in 1592. This expedition was recalled without any decisive results shortly after the death of Toyotomi. It is regarded as probable that the failure of this military action was partly due to the assistance given to Korea by China, which claimed sovereignty over the Korean peninsula.

Chinese civilization was also brought to Japan by the Chinese refugees who emigrated when the Manchus invaded and subjugated China proper in the middle of the seventeenth century.

Spain and Portugal Japan's first contact with Western countries occurred in the middle of the sixteenth century, when Portuguese and Spanish traders first visited the shores of this country. These traders were instrumental in introducing Christianity.

Britain and the Netherlands Shortly afterwards, Dutch and English traders arrived in Japan and were granted every facility for the conduct of business. In the meantime, the Jesuit and Franciscan missionaries had erected churches in various parts of the country, and their activities came to be regarded with grave apprehension as it was believed that they had political motives. Con-

Digitized by Google

sequently, the Shogunate Government ordered all missionaries to leave Japan and strictly prohibited Christianity in 1597. The Shogunate Government later went so far as to close the country entirely against communications with foreign countries, issuing a decree to this effect in May, 1636. After this, only a limited number of Chinese and Dutch traders were allowed to reside at Deshima in Nagasaki, and all contact with foreigners was made through them.

Russia Over one and a half centuries of complete seclusion followed until 1792, when Russia sought the opening of the Japanese ports to trade through her representative. In 1806, two Russian ships attacked the coast of Saghalien, plundering a Japanese town and carrying off a number of its inhabitants.

Great Britain during the Napoleonic wars attempted to supplant the Dutch merchants at Deshima by British nationals. These British ventures were followed by the arrival of Americans in Japan. Arriving in the Bay of Yedo in 1837, aboard a ship called the Morrison, these Americans tried to convince the leaders of the Tokugawa Shogunate of the inevitability of Japan entering into relations with the Western powers. A similar attempt was made by King William II of the Netherlands who, in February, 1844, sent a friendly communication to the Shogunate Government urging Japan to enter into treaty-relations with Western countries. It was not, however, until 1853, when the American fleet commanded by Commodore Perry arrived at Uraga, that the leaders of the Tokugawa régime came to consider seriously the question of regular foreign contacts.

The United States As a result of Commodore Perry's visit, Japan concluded her first treaty of amity with the United States on March 1, 1854, providing for the opening of the ports of Shimoda and Hakodaté to American citizens and for the extension of reciprocal aid to vessels in distress. Russia, Great Britain, France and other Western countries soon concluded treaties of a similar nature.

The conclusion of these treaties, for which no Imperial sanction was sought immediately, gave rise to a strong anti-foreign sentiment and several resident foreigners were murdered. A British squadron avenged these outrages by bombarding the city of Kagoshima at the southern tip of the Island of Kyushu in 1863. A similar attack was made on Shimonoseki the following year by a combined fleet of British, American, French and Dutch warships.

The international engagements entered into by the Shogunate Government were sanctioned in 1865 by the Throne, which reassumed its civil and military powers from the Shogunate Government in 1868 after having left *de facto* power in other hands for nearly seven centuries.

The Meiji Era

The "Maria Luz" Incident The first noteworthy incident in Japan's foreign relations in the Meiji Era was what is known as the Maria Luz incident which took place in 1872, when the Japanese Government successfully helped in releasing 200 Chinese slaves from the Peruvian ship Maria Luz at Yokohama. This action was upheld by an international tribunal presided over by Emperor Alexander II of Russia and was instrumental in strengthening the position of Japan as an independent nation in international politics.

Saghalien and the Loochoo In 1872, the Japanese Government proposed to buy the Island of Saghalien for

Digitized by Google

¥2,000,000, but the negotiations for this purchase were broken off on the advice of Count Kuroda, who contended that the island was worthless. Three years later Japan gave up all claim to Saghalien in exchange for Russia's recognition of Japan's sovereignty over the Kurile Islands.

The Loochoo Islands, a group lying between Kyushu and Taiwan, were formally incorporated in the Japanese Empire in 1871, when, inviting the King of Loochoo to Tokyo and creating him a peer, the Japanese Government organized the archipelago into a prefecture called "Okinawa-ken."

The Bonin Island Dispute The Bonin Islands, called in Japanese "Ogasawara-jima," were officially recognized as a territory of Japan in 1875 by the United States following a dispute as to sovereignty therein between the two nations.

Expedition to Formosa When a group of shipwrecked Loochooan sailors were massacred by the savages of Formosa (now known as Taiwan) in 1872, the Japanese Government sent a punitive expedition to the island, and a strong protest was received from China. The situation threatened to become very tense, but through the intervention of the British Minister at Peking, the trouble was settled, Japan evacuating the island and China consenting to pay an indemnity to the families of the victims of the outrage.

Treaty Revision Revision of Japan's unequal treaties with the foreign Powers was accomplished in 1894, after a series of unsuccessful attempts, which had led to the collapse of several of the most powerful Cabinets. The treaties of commerce and navigation concluded by the Shogunate Government with the Western Powers provided for the opening of the ports of Yokohama, Kobé, Osaka, Nagasaki, Niigata and Hakodaté, together with Tokyo, to commerce and residence, with extraterritorial privileges for foreign residents. These treaties also required Japan to maintain a very low scale of import duties.

It was for the purpose of seeking revision of the treaties, on the basis of a provision therein that revisions could be made after 1871, that Prince Tomomi Iwakura's mission was sent to America and Europe in 1871. The great difficulty standing in the way of the proposed revision was the agreement among the eighteen nations concerned to the effect that they would act conjointly in their negotiations with Japan. The United States alone consented to conclude a separate treaty, but a proviso in it that it should not be put into force until after the conclusion of similar treaties with the other nations deprived the document of its practical effect.

In 1882, Count Kaoru Inouyé made overtures to the British Government and a preliminary conference followed to discuss the basis of negotiations, at which elaborate preparations were made for a great conference, in which every treaty Power should be represented. Great Britain and Germany showed their willingness to make liberal concessions and for a time it looked as if Count Inouyé's efforts would be crowned with success. However, the conditions of the proposed new treaties leaked out and, feeling indignant over what they described as a humiliation to Japan, the vernacular newspapers started vigorous campaign against the proposed revision. This coincided with the sinking of a British steamer in which all the Japanese passengers perished, and this incident poured oil on the fire of the anti-foreign agitation then prevailing throughout the

Digitized by Google

country. The situation was so threatening that the Japanese Government found it advisable to postpone the negotiations for revision.

The next foreign minister to take up this onerous task was Count Shigenobu Okuma, who started fresh negotiations in 1888. Before officially starting negotiations, however, he adopted a high-handed policy towards the foreign residents in this country with a view to convincing them of the advisability of revising the treaties. In approaching the foreign Powers concerned, Count Okuma preferred to negotiate with them individually instead of collectively and first of all made overtures to Mexico, offering to allow the presence of foreign legal assessors in the Japanese Supreme Court in cases involving foreigners during a space of at least three years after the enactment of the new legal codes on Western lines. This offer was accepted. After the signing of this treaty, the United States, Germany and Russia soon expressed willingness to make agreement on similar lines, it having been agreed that the new treaties should take effect in 1890. Before the signing of similar treaties by the other Powers, however, a vehement agitation broke out in Japan against the appointment of foreign assessors, and an attempt was made on the life of Count Okuma, in which he was seriously injured.

The treaty revision negotiations, which were thus interrupted, were resumed by Viscount Shuzo Aoki, who succeeded Count Okuma as Foreign Minister. Viscount Aoki's seven proposals did not provide for the presence of foreign assessors on Japanese tribunals, and there seemed to be a good chance of these proposals being accepted by Great Britain, when, owing to an attempt made on the life of the Crown Prince of Russia then visiting Japan, Count Aoki had to resign and was succeeded by Viscount Buyo Enomoto.

Viscount Enomoto continued efforts to complete the desired revision of the treaties, but soon had to resign when the Government was defeated on the budget. In 1892, Count Munemitsu Mutsu assumed the foreign portfolio and immediately reopened negotiations with Britain. A new difficulty was added in 1893 when the House of Representatives submitted a petition to the Throne urging the abolition of consular jurisdiction, restoration of tariff autonomy and prohibition of coastal trade. To make the situation worse still, the people agitated against foreigners being allowed unrestricted right of residence and against foreign ownership of property in Japan. The Government, however, dissolved the Diet and concluded a new treaty with Great Britain on July 16, 1894, at London, signed by Lord Kimberley and Viscount Aoki, thereby finally settling the long pending question. Similar treaties were concluded with Austria, France, Germany, Italy, Russia and the United States in 1897.

The Sino-Japanese War The war with China, which arose from a complicated dispute over the independence of Korea, resulted in enhancing the prestige of Japan in the eyes of the entire world. The question whether or not Korea was an independent nation was of long standing and an open clash of interests between Japan and China led to the inevitable war.

In 1880 Japan opened a legation in Seoul, but peaceful relations between Japan and Korea were often disturbed as the result of intrigues, if not active interference, by the Chinese. In 1882, a Korean mob attacked and burned the Japanese Legation, and the legation officials

Digitized by Google

had to flee to a British gunboat then lying at anchor off Chemulpo. This incident, though settled by Count Inouyé, then Foreign Minister, who visited Seoul and succeeded in inducing the Korean Government to offer an official apology and pay an indemnity, pointed to the inevitability of war between Japan and China.

Another incident, though not directly connected with the affair just referred to, proved a more direct cause of the Sino-Japanese War. This incident took place on December 4, 1884, when, during the celebration of the opening of the Postal Bureau of Korea at Seoul, at which were present all the foreign diplomats and high officials of the Korean Government, the leader of the reactionaries was murdered and the progressives sought the assistance of Japanese troops in carrying out an anti-reactionary coup d'état. However, the Chinese troops in Seoul, who outnumbered the Japanese by twenty to one, sided with the reactionaries and the Japanese troops were forced to retreat to the Japanese Legation, which was then attacked and burned by the Chinese. In settlement of the dispute arising from this incident what is known as the Treaty of Tientsin was signed on April 18, 1885, between Count (later Prince) Hirobumi Ito and Viceroy Li Hung-chang, under the provisions of which China and Japan agreed not to send troops to Korea without previously notifying each other.

Actual warfare between China and Japan started when a party called the "Tong-haks" rebelled against the corrupt officialdom of Korea. Seeing the régime which she favoured seriously menaced by this uprising, China dispatched troops to Korea and Japan also sent an expedition in accordance with the Treaty of Tientsin. After minor clashes both on land and sea, Japan and China declared war on August 1, 1894, after which the Japanese carried out a short and entirely successful campaign. The result of the Sino-Japanese War was the Treaty of Shimonoseki, concluded on April 14, 1895, by which China recognized the full and complete independence of Korea and ceded the Liaotung Peninsula and the adjacent waters, as well as Formosa and the Pescadores, to Japan. In addition, China promised to pay an indemnity of 200,000,000 taels to Japan and open up Shashi, Chungking, Soochow and Hangchow to trade and the Yangtse-kiang river to navigation. The acquisition of the Liaotung Peninsula by Japan, however, was objected to by Russia, with the apparent support of Germany and France, and Japan had to return the territory to China, receiving, as compensation, a sum of 30,000,000 taels.

The Boxer Uprising The rendition of the Liaotung Peninsula by Japan was followed by the acquisition of territorial interests in China by various Powers. First of all, Russia obtained the right to extend the Siberian Railway through Manchuria as far as Dairen. Then Germany was granted a 99 years' lease of Kiaochow, while Russia forced China to grant her a lease of the Liaotung Peninsula for a period of 25 years. Great Britain and France subsequently obtained similar leases of Weihaiwei and Kuangchow Bay respectively.

This foreign penetration infuriated a group of Chinese patriots calling themselves Boxers who rose in arms in South Chihli in May, 1900 and besieged Peking, where the foreign envoys and their families faced imminent massacre. The legations were relieved by an allied force furnished by Japan, Russia, Great Britain, the United States, France and

Digitized by Google

Germany. In this expedition, the Japanese played the most important part, sending some 10,000 troops and 54 field guns.

The Anglo-Japanese Alliance Sharing common interests in the Far East, Japan and Great Britain concluded a treaty of alliance on January 30, 1902, in order to maintain the status quo and general peace in the Far East, simultaneously making it clear that the two countries were specially interested in maintaining the independence and territorial integrity of China and Korea. Against this, France and Russia took the precautionary measure of making the Franco-Russian Alliance applicable to the Far East.

The Russo-Japanese War After her penetration into Manchuria, Russia was forced to agree on April 2, 1902, to withdraw her troops from that region, largely through the intervention of Japan, Great Britain and the United States. According to this agreement, Russia was to complete her evacuation of Manchuria within 18 months. Shortly afterwards, however, she made new demands on China, in exchange for her agreement to withdraw troops, apparently with a view to securing a position of political and economic predominance in Manchuria. This was followed by the sending of Russian soldiers in the guise of civilians to Korea.

Thus menaced, Japan made proposals to Russia for the conclusion of an agreement aimed at guaranteeing Korean independence and reciprocal recognition of Japan's preponderant interests in Korea and Russia's special interests in Manchuria. These proposals were virtually rejected by Russia, with the result that Japan declared war on February 10, 1904. This conflict ended in the victory of Japan and a treaty was signed at Portsmouth, New Hampshire, U.S.A., between the two countries through the good offices of President Roosevelt, on September 5, 1905.

By this treaty Russia recognized the preponderant interest, political, military and economic, of Japan in Korea, and the two signatories agreed to evacuate Manchuria simultaneously. Russia also turned over its lease of Port Arthur and Dalny (Dairen) and their adjacent lands and waters to Japan, while provision was made for joint Russo-Japanese operation of the Manchurian railway. The treaty also stipulated the cession to Japan of the southern part of Saghalien Island as far north as the 50th degree of north latitude, together with the adjacent islands.

After the Russo-Japanese War Japan concluded a convention with China, on December 2, 1905, known as the Treaty of Peking, embodying the relevant terms of the Treaty of Portsmouth. This was followed by the signing of the Franco-Japanese Convention, on June 10, 1907, the exchange of what are known as the Takahira-Root notes on November 30, 1908, and the conclusion of the Russo-Japanese agreement, on July 30, 1907, all these pacts being designed to preserve peace in the Far East.

Annexation of Korea As a result of the Russo-Japanese War, Korea was made a virtual protectorate of Japan, but to make Japan's protection over Korea complete, Prince Hirobumi Ito, as Japanese ambassador, concluded a convention with the Korean Government on November 17, 1905, providing for the transfer of the control of Korean foreign relations to Japan and establishment of a Japanese Residency-General in Seoul.

Later developments in Korea, however, led to the abdication of the Korean King on July 17, 1907, and a week later a new agreement

Digitized by Google

was signed according to Japan practical control of the administration of the country. The formal Treaty of Annexation of Korea to Japan was signed on August 22, 1910.

The Taisho (1911-1926) and Showa Era (1926-)

The World War Less than two months after the outbreak of the European War, Japan participated on the side of the Allies, sending an ultimatum to Germany on August 16, 1914, followed by declarations of war on Germany and Austria on August 23 and 27 respectively. Refusing to send troops to Europe, her activities were confined to her attack on the German fort at Tsingtao and rendering naval assistance for the protection of Allied shipping in the southern Pacific and other waters.

At Tsingtao, the Japanese military and naval forces occupied the German base on November 7, 1914, after operations lasting only a week. In the meantime, the Japanese Navy occupied between October 3 and 19 all islands in the southern Pacific north of the equator with the exception of the island of Yap, which a British squadron had taken before the arrival of the Japanese. From the beginning Japan insisted on occupying these islands permanently despite repeated refusals on the part of Great Britain officially to support the Japanese claim. Moreover, in March, 1917, a secret agreement between the two countries provided for the permanent occupation of these islands by Japan in return for her dispatch of destroyers to the Mediterranean Sea. At the Peace Conference, however, her claim to permanent sovereignty was rejected and she was given only a mandate over the islands.

The Washington Disarmament Conference Japan first participated in international efforts to limit armaments in 1921 at the Washington Conference which opened on November 11. After strongly insisting on a 7-10-10 ratio against the navies of Great Britain and the United States, she accepted a 3-5-5 ratio with regard to capital ships.

At this conference, Secretary Hughes of the United States proposed with regard to capital ships that the United States, Great Britain and Japan scrap respectively 30 ships totaling 845,740 tons, 23 ships totaling 583,375 tons and 17 ships totaling 448,928 tons, including those in course of building, and that the three countries be allowed to retain 506,050 tons in 18 ships, 604,450 tons in 22 ships and 299,700 tons in 10 ships, respectively. After negotiations on the basis of the Hughes proposal, an agreement was reached, with some changes made in the ships to be scrapped. By this agreement Japan was allowed to retain the "Mutsu" instead of the "Settsu" and the United States the "Washington" and the "Colorado" instead of the "North Dakota" and the "Delaware," while Great Britain agreed to scrap four King George V class ships, building two new ships of not more than 35,000 tons each instead. Consequently, the capital ship tonnage which the three Powers were allowed to retain was 525,000 tons in 18 ships for the United States, 581,200 tons in 20 ships for Great Britain and 313,000 tons in 10 ships for Japan.

As regards the replacement of obsolete ships, it was agreed that capital ships might be replaced after 20 years in service, providing that the new ships do not exceed 35,000 tons each in displacement. On completion of the replacement stipulated above, the United States and Great Britain were to have 15 capital ships totaling 525,000 tons each against

Digitized by Google

9 ships aggregating 315,000 tons for Japan, while France and Italy accepted a total capital ship tonnage of 175,000 tons each.

With regard to auxiliary ships, no agreement was reached on the total tonnage for each country, France claiming 350,000 tons in auxiliary ships and 90,000 tons in submarines, to which Great Britain and the United States were vigorously opposed. The proposal made by Great Britain favouring the total abolition of submarines added to the difficulties of making a total tonnage agreement regarding auxiliary ships. It was finally decided that an auxiliary ship must not exceed 10,000 tons in displacement and must not carry guns of more than 8 inches in calibre. A summary of the Washington provisions is given in the following table:

CAPITAL SHIPS

	Japan	G. Britain	U.S.A.	France	Italy
Total tonnage for each signatory	315,000	525,000	525,000	175,000	175,000
Tonnage limit for a single ship	35,000	—	—	—	—
Limit of gun calibre	16 inches	—	—	—	—

AIRCRAFT CARRIERS

	Japan	G. Britain	U.S.A.	France	Italy
Total tonnage for each signatory	81,000	135,000	135,000	60,000	60,000
Tonnage limit for a single ship	27,000	—	—	—	—
Limit of gun calibre	8 inches	—	—	—	—

AUXILIARY SHIPS

Total tonnage	Not agreed on
Tonnage limit for a single ship	10,000 tons
Limit of gun calibre	8 inches

As to fortifications and naval bases in the Pacific, it was agreed that the status quo should be maintained.

In addition to the general disarmament treaty the five Powers also concluded an agreement limiting the use of submarines and poison-gas in warfare.

At this conference, Japan was represented by Admiral Baron Tomosaburo Kato, then Minister of Marine.

Tri-partite Conference This conference opened on June 20, 1927, and was participated in by Japan, Great Britain and the United States, with a view to settling certain questions left over from the Washington Conference. Japan was represented by Admiral Viscount Makoto Saito, then Governor-General of Chosen. At the outset the three countries presented their respective proposals, when it became evident that there was an almost unsurmountable difference between the claims of Great Britain and the United States.

The Japanese delegate did his best to reconcile the British and American theses, while making it clear that Japan was in no position to accept the 3-5-5 ratio in regard to auxiliary ships. In this latter connection, Japan succeeded in reaching a compromise with Great Britain but failed to induce the United States to agree to it. Thus all efforts ended in failure and the three Powers concerned closed the conference after publishing a joint declaration.

The London Conference At the naval disarmament conference called in London on January 21, 1930, in which the United States, Great Britain, Japan, France and Italy participated, the Japanese delegation

Digitized by Google

headed by Mr. (later Baron) Reijiro Wakatsuki, upheld what they called "the three great principles" of Japan. These were (1) a total tonnage of 8-inch gun cruisers for Japan equal to 70 per cent. of that possessed by the United States, (2) no abolition or material reduction of submarines and maintenance of the then existing submarine strength of Japan, i. e. 78,500 tons, and (3) a ratio of 7-10 against the United States in the global tonnage of auxiliary vessels on the basis of the two foregoing conditions.

The conference was fraught with numerous difficulties. In the first place, opinion was divided as to whether global tonnage or different categories of vessels should be taken as the basis for proposed reduction, but this difficulty was overcome by a compromise allowing these two bases of reduction to be discussed simultaneously. By far the greatest difficulty was the difference between the Japanese and American theses, Japan claiming the ratio of 7-10 and the United States insisting on that of 5-3. To make the situation still worse, France claimed a global tonnage of 721,400 tons. The American-Japanese entanglement, however, was in a large measure smoothed out through informal conversations between Mr. Tsuneo Matsudaira, Japanese Ambassador in London, and Mr. David A. Reed, of the American delegation.

To summarize the Japanese-American compromise, Japan was accorded a global tonnage of auxiliary vessels equal to 70 per cent. of that held by the United States, and in regard to submarines, Japan reduced her claim of 78,500 tons to 52,700 tons on the condition that parity was to be maintained between Japan and the United States in this respect. As for the ratio of 10,000 ton cruisers, Japan was allowed to retain a number of such ships equal to 70 per cent. of those possessed by the United States until 1936, while the United States was allowed to lay down the keels of three more ships of this category on condition that they should not be completed during the stated period.

Besides extending the naval holiday for a period of another six years, the London Naval Treaty, which was signed on April 22, 1930, affects Japan in the following respects:

(1) Japan was required to remove from active service the capital ship "Hiyéi", although she was allowed to retain it for training purposes.

(2) Japan was allowed to replace the minelayers "Aso" and "Tokiwa", provided that the two new ships should not exceed 5,000 tons in displacement.

(3) Japan was required to dispose of the "Asama", "Yakumo", "Izumo", "Iwaté" and "Kasuga" when the first three vessels of the Kuma class were replaced by new ships.

The following table gives the tonnage limits in the cruiser, destroyer and submarine categories which, under the London Treaty, the ships of the three greatest naval Powers, as completed by the end of 1936, are not allowed to exceed:

Categories	United States	Great Britain	Japan
Cruisers:			
(a) with guns of more than 6.1 inch calibre	180,000 tons	146,800 tons	108,400 tons
(b) with guns of 6.1-9 inch or less	143,500 „	192,200 „	100,450 „
Destroyers:	150,000 „	150,000 „	105,500 „
Submarines:	52,700 „	52,700 „	52,700 „

The League Disarmament Conference

Late in 1932, when the general disarmament conference was called at Geneva after years of preparation by the disarmament commission of the League of Nations, Japan also submitted a plan of her own with regard to naval limitation and reduction. This proposal, which was published on December 11, 1932, made it known that Japan was desirous of making it the guiding principle of the conference that offensive power should be reduced and that the geographical and other special circumstances of each country should be fully taken into consideration in making any settlement.

As regards the formula of the projected agreement, Japan proposed to divide it into general and special agreements. In the general agreement, it was proposed to arrange for the qualitative reduction of all vessels, and also the quantitative reduction of "offensive" vessels, belonging to Japan, Great Britain, the United States, France and Italy.

With regard to the special agreement, all the countries of the world should be divided into four groups, under (1) the Pacific group, (2) the Atlantic group, (3) European group and (4) the South America group; and each group should arrange for limitation and reduction of the armament of each of its members. Any country interested in more than one group should participate in the disarmament discussions of all groups in which it is interested.

As a concrete plan in line with these principles, Japan proposed to limit the sizes of vessels of the various categories and their gun calibres as follows:

Capital ships	25,000 tons	14-inch guns
A class cruisers	8,000 ,,	8- ,, ,,
B class cruisers	6,000 ,,	6.1- ,, ,,
Destroyers	1,500 ,,	5.1- ,, ,,
Submarines	1,800 ,,	5.1- ,, ,,

It was further proposed that aircraft carriers should be totally abolished and no vessel of war should be equipped with a landing platform or deck for aeroplanes.

Further, the capital ships of the three greatest naval Powers should be reduced to 200,000 tons in 8 vessels for Japan, and 275,000 tons in 11 vessels each for the United States and Great Britain. France and Italy should be allowed to retain any number of vessels within a total limit of 150,000 tons.

In respect of the A class cruisers, Japan proposed to limit them as follows:

Japan	10 ships	80,000 tons
Great Britain	12 ships	96,000 ,,
United States	12 ships	96,000 ,,

France and Italy should be allowed to fix the ratio between their strengths in this class of vessel by mutual negotiations within a limit of 7 ships with a total tonnage of 56,000 tons each.

Finally, the Japanese plan proposed that Japan, Great Britain, the United States, France and Italy should each be allowed the maximum limit of 150,000 tons in B class cruisers, 150,000 tons in destroyers and 75,000 tons in submarines.

Relations with the League of Nations

Japan's connection with the League of Nations began with the inception of the international organization in April, 1919, when the Covenant was officially adopted at Paris, and came to a virtual end on March 27, 1933, when Japan gave notice of her withdrawal from membership on grounds of dissatisfaction with the dealings of the Geneva body with the Sino-Japanese dispute, particularly with the report adopted by the League Assembly on February 24 and the recommendations for the settlement of

Digitized by Google

the problem as contained therein. Her membership will not, of course, be officially withdrawn for two years after the notice, in accordance with the provisions of the League Covenant.

Contribution to League's Work During the period of her participation in the activities of the League Japan made a material contribution to its work. In the Secretariat of the League, too, Japanese co-operation was by no means negligible, Dr. Inazo Nitobé and Dr. Yotaro Sugimura having served as Assistant Secretary-General in succession until early March, 1933, shortly before Japan's virtual withdrawal. What follows is a cursory review of Japan's relations with the League.

From the inauguration of the League until the present, Japan has served as one of the five permanent members of the Council. Moreover, she has contributed a considerable sum to the revenue of the body, her annual subscriptions between 1926-1932 having amounted to 16.5 per cent. of the total expenditure.

The problem of general disarmament was taken up by the disarmament preparatory commission of the League in 1925. After meeting in session several times the commission submitted its draft formula for general disarmament to the Council in January, 1931 and the General Disarmament Conference was convened to meet at Geneva to discuss limitation of the military, naval and aerial armaments of all countries late in 1932, when Japan's delegates submitted their proposal regarding naval disarmament as outlined on page 185.

Relations with the Permanent Court As regards the Permanent Court of International Justice at the Hague, Japan has rendered due assistance to the League of Nations' efforts for arbitration at this court by sending jurists to sit on its benches, but she has not yet participated in the general provisions for peaceable disposal of international disputes, which were adopted at the Assembly in 1928. Nor has she decided yet on the adherence to the "optional clause" of the Hague court, which has been signed or accepted by Great Britain, France, Italy and about forty other countries, thereby expressing their willingness to accept compulsory arbitration in international disputes.

Relations with the International Labour Office Among the various conventions drafted by the International Labour Office of the League of Nations, Japan has ratified the following on the dates given in parenthesis:

(1) Convention concerning workmen's compensation for occupational diseases (November 2, 1922).

(2) Convention fixing the minimum age for admission of children to industrial employment (June 3, 1926).

(3) Convention fixing the minimum age for admission of children to employment at sea (June 4, 1924).

(4) Convention for establishing facilities for finding employment for seamen (November 23, 1922).

(5) Convention concerning the age for admission of children to employment in agriculture (December 9, 1923).

(6) Convention concerning the compulsory medical examination of children and young persons employed at sea (June 7, 1924).

(7) Convention concerning workmen's compensation for occupational diseases (October 8, 1928). Note: this convention does not apply to such overseas dependencies of Japan as Chosen, Taiwan, Karafuto, the Kwantung Leased Territory and the mandated islands in the Southern Pacific.

Digitized by Google

(8) Convention concerning equality of treatment for national and foreign workers as regards workmen's compensation for accidents (October 8, 1928). Note: this convention also does not apply to the overseas dependencies of Japan mentioned above.

(9) Convention concerning the simplification of the inspection of emigrants on board ship (October 8, 1928). Note: this also does not apply to the above mentioned territories.

The League commission on international communication and transit has drafted several conventions, of which Japan ratified the one concerning freedom of communication in 1922, and two others concerning seaports and railway systems in 1926.

World Economic Conference

This conference was preceded by informal inter-governmental pourparlers held in Washington in May, 1933, through the good offices of President Roosevelt of the United States, with the object of coming to some general understandings in preparation for the more formal negotiations. At these pourparlers Japan was represented by Viscount Kikujiro Ishii, veteran diplomat and privy councillor, who headed the Japanese delegation to the London Conference. The Japanese delegation also included Mr. Tsunéo Matsudaira, Ambassador in London, and Mr. Eigo Fukai, Vice-Governor of the Bank of Japan. Mr. Sotomatsu Kato, counsellor of the Japanese Embassy in London, acted as secretary-general to the delegation.

The London Conference opened on June 12, and on the second day of the plenary session Viscount Ishii delivered an address on behalf of the Japanese Government, expressing Japan's willingness to co-operate and emphasizing the urgent need of "a free interchange of world commodities on a basis of equality", adding that it was "highly desirable that there should be an unrestricted application of the most favoured nation clause" and that the conference had "a great rôle to play" in that connection.

During the following sessions of the conference, however, a series of unforeseen difficulties arose and finally the exchange problem proved an unsurmountable stumbling block, wrecking the parley officially on July 27, when the plenary session was declared adjourned indefinitely. Efforts were made by some delegates to avert failure. In this connection, it may be remembered that during a meeting of the conference bureau Viscount Ishii suggested that discussion should be continued on questions other than the exchange problem instead of adjourning the conference altogether.

Relations with Great Britain

Abrogation of 1905 Convention The trade relations between Japan and India received a serious setback in 1933 when notice was served Japan in April through the British Government of the abrogation on October 10, 1933, of the Indo-Japanese Trade Convention of 1905.

This step was followed by an increase of the import duty of the Indian Government on Japanese cotton fabrics from 50 per cent. to 75 per cent. ad valorem on June 6, 1933. The duty on British cotton fabrics remained at 25 per cent. This drastic action on the part of the Indian Government caused the Japanese cotton spinners to boycott Indian cotton, and the situation was such that the British Government suggested the opening of negotiations between the industrial and trade in-

Digitized by Google

terests of Japan, India and Great Britain in the hope of finding a solution.

Simla Conference Opinion was divided among industrialists in Japan with regard to acceptance of the British proposal, but it was finally decided to send representatives both to London and Simla to confer with representatives of the British and Indian interests. For the Simla conference, which was scheduled to be held on September 22, with the British and Indian delegates present, Mr. Setsuzo Sawada, former chief of the Japanese Bureau of the League of Nations, Mr. Susumu Terao, chief of the Trade Bureau of the Commerce and Industry Ministry, and Mr. Tetsuichiro Miyaké, Consul-General at Calcutta, were appointed to represent the Japanese Government, although they were not given full powers because the British Government had made it known that any agreement to be reached at Simla was subject to the approval of the British Government, while no official assurance was obtainable as to whether such an agreement would be adopted by the British Government without modification.

The Agreement Negotiations were not easy due to conflicts of interests of the two countries and more than 3 months was spent before it came to the final agreement of January 5, 1934, at New Delhi. Agreement was reached on various important problems relative to the commerce between Japan and India, including: (1) most-favoured-nation treatment; (2) a provision to open negotiations with a view to modifying customs tariff; (3) measures to be taken to adjust the effects of the exchange fluctuations; (4) customs duties applicable to Japanese cotton piecegoods imported into India; (5) a quota to be applied to the same; and (6) enforcement of the agreement entered into. The gist of the agreement follows:[1]

(1) Customs duties to be imposed on Japanese cotton piecegoods should not exceed following rates.

Duty on plain greys	50 per cent. ad valorem or 5.25 annas per pound
Duty on others	50 per cent. ad valorem

It is understood that the Government of India shall not impose on Japanese cotton piece-goods other than plain greys a specific duty exceeding 5.25 annas per pound subject to agreement concerning most-favoured-nation treatment.

(2) Basic quota of Japanese cotton piecegoods to be exported to India in a piece-goods year shall be 325,000,000 yards, and it shall be linked with 1,000,000 bales of India raw cotton exported to Japan in corresponding cotton year.

(3) Treaty shall come into force immediately after exchange of ratifications and shall remain in force until March 31, 1937.

Specific Duties The conference however could not come to happy ending because of specific duties imposed by the Government of India on December 23, 1933, which are applicable to large part of Japanese miscellaneous goods exported to India. The increase in duties are so heavy as to deal a serious blow to the export of miscellaneous goods from Japan, notably hosiery, earthenwares and potteries, enamelled ironwares and pencils the new duties are prohibitive, although Sir Joseph Bhore told Mr. Sawada that the new tariffs were meant to protect domestic industry and in no way unreasonable.

On January 22 Mr. Sawada met Sir Joseph Bhore, member of the Executive Council, Railways and Commerce, to call attention of the Indian Government concerning the new duties imposed upon the Japanese miscellaneous goods presenting Japanese views in a written form. On January 26 in answer to the inquiry of Sawada on the intention of

1 For particulars of the agreement see "Commercial Treaty between Japan and India" (Appendix).

Digitized by Google

the Government of India to increase in duties on Japanese rayon goods, Bhore admitted the fact, and it caused another apprehension among the Japanese manufacturers and traders concerned.

The Indo-Japanese Trade Agreement was signed in London on July 12, 1934.

Anglo-Japanese Trade Issue The marked progress of Japanese cotton textiles and miscellaneous goods in the world markets and especially of those of the British Empire caused the London authorities to take measures to minimize its effect in order to protect the interests of their own manufacturers. On May 15, 1933, the British Government intimated the Japanese Government with their intention of exempting West Africa from the operation of the Commercial Treaty of 1911, with one year's grace. This act seemingly spurred a tendency of impeding by several means the import of Japanese goods. Simultaneously with the above notification the British Government suggested an Anglo-Japanese trade conference to be held at London between the delegates of traders of the two countries. To this proposal Japan consented and in August, 1933, sent delegates to London. But circumstances delayed its opening till February 14, 1934.

The initial meeting was held in the Board of Trade building and was attended by Thomas Barlow, John Grey, J. Ainsley, Raymond Streat and H. G. Hughes representing the British side; and Gentaro Okada, Gota Miyaké, Kazuyoshi Mimura, Masao Kawaguchi, Tokuzo Tamagaki and Katsunosuké Shimada the Japanese side.

A British note was presented defining the geographical areas to which an agreement to be reached should apply. The British intention was evidently to cover all of the world markets where a ratio of imports of British and Japanese goods should be established. To this, however, the Japanese delegation took strong exception, saying that neither the British nor the Japanese Government had right to drag in a third country over which it had no control into the business. It proposed that the agreement to come should not apply to all the British Empire, but only to the Crown colonies.

At the second meeting of February 21 the Japanese delegation handed a formal answer to the British note regarding the division of geographical areas. The answer reiterated what was said at the first meeting, saying that the agreement to come should apply only to England and her colonies, and not to the third States and the British Dominions. On February 26 the third parley was held and the British delegation stated that in order to initiate peace in the world cotton textile market the Anglo-Japanese negotiations must be based upon the condition of the world market in general and there would have been no need of a conference, if it were to discuss the matter only in relation to England and Crown colonies. To this the Japanese delegation countered with the contention that it was out of the question to negotiate with Britain about matters which entirely or mainly belong to the third parties.

Together with the division of geographical areas, the British delegation proposed a ratio of British and Japanese cotton textile exports to the world markets, ¥2,190,000,000 for the British and ¥1,410,000,000 for the Japanese. But the question of whether or not to include all the world markets being unsolved, discussion on the ratio question practically made no headway and in spite of the efforts on both sides in and out of the conference room, the ne-

Digitized by Google

gotiations were closed on March 14, leaving the entire problem where it had been before.

Japan-Dutch Conference

On the heels of the Indo-Japanese trade conference, Japan decided to negotiate on trade with Holland. In the talks at The Hague in December, 1933, between the Dutch Premier and Japanese diplomatic representatives, it was decided that Japanese and Dutch delegations negotiate in Java on the trade relations of Japan and the Dutch East Indies and that the outcome of their discussions be further debated at the Hague by representatives of both governments.

Dutch Indies constitute Japan's fourth most important market, and since 1932 they have been taking more from this country than from Holland itself, a situation that has naturally led the Dutch industrialists to campaign for restrictions against Japanese commodities.

With the purpose, on the part of the Dutch East Indies, to adjust the one sided trade relation with Japan for it bought ¥157,487,000 and sold ¥55,709,000 in 1933, the Japan-Dutch trade conference has been opened at Batavia on June 8, 1934. In the opening adress Dr. J. W. Mejer Ranneft, the chief Dutch representative and Vice-president of the Dutch East Indies Council, pointed out that to uphold and maintain one's own interests in new economic world was the right position to adopt.

Dr. Haruichi Nagano, the chief Japanese delegate and former Ambassador in Paris, made his speech after Dr. Ranneft and urged that the relations between the Dutch East Indies and Japan not only must be of an enduring nature but also must harmonize with the economic aspects of each country.

General committee meetings have been held on June 26 and 27, without much results. (See Chapter XVIII.)

Relations with Soviet Russia

After the Siberian expedition in which Japan participated from 1918 until 1920, diplomatic relations were not restored between the Japanese and Russian Governments until 1924, although Japan had withdrawn her troops from Siberia few years previously.

After her participation in the World War, Japan concluded an agreement with Russia on July 3, 1916 for the purpose of preventing Russia from making peace with Germany independently of the other Allies. At this time there was a rumour that the two countries had concluded an offensive and defensive alliance. Following the establishment of the communist régime in Russia, in 1917, Japan sent the 3rd and the 12th divisions and a part of the 7th division to Siberia between August and October of 1918, in compliance with a proposal from the United States, in order to enable some 50,000 Czechoslovak troops (formerly prisoner of war taken by the Russian from the Austrian armies) to establish contact with the Allied armies in the East. This expedition to Siberia automatically disrupted the diplomatic relations between Japan and Russia, and even after the Czechoslovak troops had re-established liaison with the other allied armies, the Japanese remained in Siberia with fresh troops relieving the first expeditionary forces. The American and other foreign troops were withdrawn early in 1920, but Japan in spite of the demand for withdrawal by the Soviet Government of Irkutsk on March 11, 1920, continued to station her troops in the vicinity of Vladivostok and Habarovsk for the professed purpose of protecting the Japanese resi-

Digitized by Google

dents there. On March 18 and 19, 1920, partisan troops attacked the Japanese consulate, Nikolaevsk, killing all the officials and guards. On March 31, the Japanese Government issued a statement to the effect that Japan had no territorial designs in Siberia, but that the withdrawal of troops was impossible in the circumstances. Japan maintained relations with the Far Eastern Republic, constituted an independent state in February, 1921, until January, 1922, when this region was incorporated in the U. S. S. R.

With a view to restoring diplomatic relations with Soviet Russia, with which she shared interests on the Asiatic mainland, Japan undertook to negotiate with the Russian representatives on several occasions at Changchun and Dairen. Such efforts were resumed in 1923 in Tokyo, where M. Joffe and Mr. Toshihiko Kawakami met in conference officially representing Soviet Russia and Japan respectively, through the good offices of Count Shimpei Goto, but no satisfactory results were forthcoming. It was at Peking that the diplomatic relations between the two countries were resumed officially on January 20, 1925, when Mr. Kenkichi Yoshizawa, the Japanese Minister there, succeeded in concluding an agreement with M. Kharahan, the Soviet representative, after seven months' negotiations.

The Fishery Dispute The first fishery convention between the two countries had been concluded in 1907, and after the resumption of Soviet-Japanese relations, efforts were made for its revision and, following the visit to Russia by Count Shimpei Goto in this connection, the revised convention was signed on January 24, 1928, remedying such provisions as had proved disadvantageous to the Japanese and otherwise improving the pact to meet the new situation. However, this revision was later found to be imperfect and disputes arose one after another between the Japanese fishing interests and the Soviet authorities regarding the details of the fishery convention.

Among other issues in this connection the most notable in recent years was that concerning the exchange rate of the rouble. This dispute originated in the inspection of the Vladivostok office of the Bank of Chosen by the local Soviet authorities and the subsequent prohibition of free transactions in rouble exchange. As a result, the Japanese fishing interests, which had been paying various taxes and rates to the Soviet authorities with Soviet currency obtainable at the Vladivostok office of the Bank of Chosen at depreciated exchange rates, now faced the necessity of exchanging the yen for the rouble at an official rate five or six times higher than the open market value. In order to settle this problem, the Japanese Government demanded that either the rents of the fishing leases or the official exchange value of the rouble be reduced, and this proposal was followed by prolonged negotiations in Moscow and Tokyo.

The negotiations were started in Moscow in October, 1930, but soon afterwards the Soviet Ambassador to Japan, M. Troianovsky, took up the dispute in Tokyo, and communicated the willingness of his Government to reduce the official exchange rate of the rouble by 25 per cent., when selling debentures of the state operated corporation, "Aco" (in charge of the Russian fishery interests), fixing the rate at 75 sen in Japanese currency. In reply Japan insisted on the rate of 30 sen for the rouble, and negotiations continued until April 26, 1931, when a compromise was reached providing that the payments of the Japanese fishing

Digitized by Google

interests to the Soviet authorities during the year of 1931 should be made with "Aco" debentures to be purchased at the rate of 32.5 sen for the rouble.

In view of this dispute and other difficulties arising from the differences between the two countries in the interpretation of the provisions of the Fishery Convention, Japan proposed on June 22, 1931, to open a conference with Soviet Russia to reconsider the whole convention. After a delay of five months, Soviet Russia consented to negotiate with Japan and pourparlers were started between Mr. Koki Hirota, the Japanese Ambassador, and M. Kharahan, Assistant Commissar of Foreign Affairs of Soviet Russia, on November 27, 1931. No substantial progress, however, was made during the negotiations, which were carried on with frequent interruptions for several months.

On February 20, 1934, the auction for the current year of the fishery grounds was held at Vladivostok. Bids were submitted by both Japanese and Soviets. The Soviets, however, declared that the Japanese bids were unacceptable, because they were accompanied by a guarantee made out at the rate of 32.5 sen, instead of 75 sen as ruled by the Vladivostok fishery authorities, per ruble, and the Soviets' bids, which numbered 60, were accepted as valid. The reason that a Japanese interests insisted upon a 32.5 sen rate of exchange is based upon a provision in the Shidehara - Troiaunovsky Agreement of April 26, 1931.

On February 25 the Russian authorities proposed a compromise which purported to permit Japanese bidders to enter new offers at 32.5 sen on February 28 for the remaining 66 fishing grounds, provided that the exchange rate question would be held open for future negotiations. This was accepted by the Japanese interests and the grounds were given them at the auction held on May 20.

The question of yen-ruble exchange still remained and negotiations to settle the matter were opened on June 17 at Moscow, from then up to February 21, 1935, the negotiations were held 15 times. At the date of writing (July 31, 1935), however, the negotiations remain in abeyance. The reason for this was that both the Soviets and Japan insisted upon their original rates, the former upon 75 sen and the latter 32.5. The yen-rouble question had to be solved in the negotiations incidental to the Japan-Soviet Fishery Treaty. This treaty will mature in May, 1936. As Japan thought it necessary to revise it, the Foreign Office caused Ambassador Tamekichi Ohta, in Moscow, to make a proposal to the Moscow Government in May, 1935, one year prior to the date of maturity, in conformity with Article XV of the treaty, for its revision. Four things which are held essential by the Tokyo Government are: (1) the revision of the method in acquiring fishing grounds by bids (2) the readjustment in the restriction of the amount of fishing (3) the rationalization of the method of lease rental payment and (4) the concrete plans for the protection of fishes. The Japanese Government sees that the present method of bidding for fishing grounds is a source of disputes and it intends to do away with this once for all. It also regards the restriction of the amount of catch improper and intends to revise it properly. In the third place, the Japanese bidders find it very inconvenient to pay the rental on the basis of yen-rouble quotation, because it is in no way stabilized, and are desirous of placing it on the yen basis. As regards the protection of fishes, the Japanese have

Digitized by Google

already enforced the control of open-sea fishery to prevent reckless catches of salmon and salmon-trout in Kamchatka and the Japanese Government desires that the Soviet side will also prohibit catches of salmon and salmon-trout in Kamchatka rivers.

Non-Aggression Pact Proposals Frequent overtures have been made by Soviet Russia with a view to concluding a non-aggression pact with Japan. This question was first broached when Mr. Kenkichi Yoshizawa visited Moscow on December 31, 1931, on his way home from Paris to be installed as Foreign Minister. Receiving Mr. Yoshizawa and Mr. Koki Hirota, M. Litvinoff, Commissar of Foreign Affairs, and M. Kharahan, proposed the conclusion of a non-aggression pact. On January 12, 1932, the Soviet Ambassador in Tokyo, M. Troianovsky, called on Mr. Inukai, then Premier and Foreign Minister, to obtain the views of the Japanese Government on this question, and a few days later Tass, the official news agency of the Soviet Government, carried a report endorsing the truth of the Kharahan-Yoshizawa conversations in Moscow and the Troianovsky-Inukai meeting in Tokyo.

The Soviet proposal was further explained by Mr. Yoshizawa, who, on his arrival in Tokyo on June 16, told the press that the Soviet Government was very eager to conclude with Japan a non-aggression pact similar to those they had concluded with Turkey, Persia, Afganistan and Lithuania. However, no great enthusiasism was evinced in government circles in Japan regarding this proposal, which was little discussed by the press until the late autumn of 1932, when a special dispatch to the Tokyo Nichinichi, dated from Mukden October 22, reported that the Government had sought the counsel of the headquarters of the Kwantung army in Manchuria on this question. According to this report, General Nobuyoshi Muto, commander of the Kwantung army, replied that the local military authorities were in favour of the non-aggression pact project provided that conditions necessary for Japan's defence were accepted by Soviet Russia.

When Mr Yosuké Matsuoka, the chief Japanese delegate to the League of Nations, visited Moscow on his way to Geneva on November 4, 1932, this question seems to have been taken up anew during his conversations with M. Kharahan.

Since then, however, no further steps have been taken in the matter on either side.

Negotiations for Sale of the N. M. R. Through the good offices of the Japanese Government a conference was opened in Tokyo on June 26 between representatives of Soviet Russia and Manchoukuo regarding the proposed sale of the North Manchuria Railway (formerly the Chinese Eastern Railway). Japan took no active part in the railway negotiations, except that a few Japanese officials attended the sessions as observers.

According to a memorandum stating the fundamental principles for the transfer of the North Manchuria Railway submitted by the Soviet Russia at the third official meeting held on July 4, 1933, the sale price was put at 250,000,000 gold roubles. The price offered by Manchoukuo was ¥50,000,000. The Soviet side based its calculation on the amount of its investment totalling 411,690,000 gold roubles up to 1932 and, taking into consideration the depreciation of economic value of the railway and its condition of damage, it finally estimated the total amount of transfer at 250,000,000 gold roubles. The Manchurian side appraised the value

Digitized by Google

on the basis of the prevailing construction cost. In March, 1934, the Soviet side brought down the price to ¥200,000,000, but the Manchurian side lowered it to ¥100,000,000 in April of that year. Through mutual concession, the price was fixed at ¥170,000,000 on September 21, 1934. During the intervening period Foreign Minister Koki Hirota held interviews with Ambassador Youreneff ten times and Mr. Shigenori Togo, Director of the Europe and Asia Bureau, of the Foreign Office, saw M. Benedict I. Kazlovsky, one of the Soviet delegates, eight times on negotiations. Finally, the negotiations were concluded on January 21, 1935, and on March 23 the signing of the agreement took place at the official residence of the Foreign Minister in Tokyo. According to the resume of the Transfer Agreement, all the property of the North Manchuria Railway (the old Chinese Eastern Railway) will be sold to Manchoukuo for ¥140,000,000. In addition, Manchoukuo shall pay ¥30,000,000 as retirement allowances for Soviet employees of the railway. It is also provided for in the Agreement that one-third of the transfer price shall be paid in cash and two-thirds in goods, all to be completely paid in three years. The Japanese Government guarantees the Manchoukuo Government completely fulfils the payment.

North Saghalien Oil Concession Problem

The North Saghalien Oil Concession contract, based on Article VI of the Japanese-Soviet Basic Treaty, concluded in October, 1925, proves very disadvantageous to Japan as well as the Japanese-Soviet Fishery Treaty. The whole area where oil prospecting is to be undertaken is divided like a checker board. If one bloc of the board is assigned for Japan to prospect, the adjoining bloc is claimed by the Soviet side as its prospecting field. When Japan succeeds in turning out oil by prospecting paying an enormous amount of expenses and changes it into an oil mining section, the Soviet side enlists the adjoining bloc into its oil fields, thus profiting without much trouble and expenses. It is also disadvantageously provided for in the treaty that the term of oil prospecting in unexploited fields covering an area of 1,000 versts in Ocha districts is fixed at only 10 years. Moreover, North Saghalien is open to the practicability of actual work for a brief period of only two or three months during summer. The actual period of operation throughout 10 years is therefore only about 20 or 30 months. The term will mature at the end of 1936. The North Saghalien Oil Company has been negotiating with the Soviet Government for extension of the term of prospecting since about seven years ago. The Foreign Office also has been negotiating with Soviet authorities in Moscow for extension of the term through Ambassador Tamekichi Ohta.

Relations with the United States

The mutual friendship of Japan and the United States largely hinges upon their respective interests on the Asiatic continent, most notably in Manchuria and China proper. The United States first made it known in 1899 that she had an equal claim in China to that of other Powers by advocating the so-called Open Door policy. The United States thought it necessary to assert this principle in order to catch up with the other Powers, which had already acquired extensive interests in China, and it followed naturally that the Americans should sympathize with Japan in her des-

Digitized by Google

perate attempt in 1904-5 to force Russia out of Manchuria and leave the region open to all nations interested.

The Four-Power Treaty For the same reason the United States objected to Japan's occupation of Shantung during the World War. The result was that Japan formally restored the territory to China on May 17, 1919 and at the Washington Conference, 1921-22, agreed to complete evacuation thereof. The Four-Power Treaty concerning the insular possessions of the signatories in the Pacific and the Nine-Power Treaty regarding the sovereignty and the open door principle of China, which were signed at the Washington Conference, also had a more important bearing upon Japan and the United States than on the other signatories. The Four-Power Treaty provided that the signatories should mutually respect the right of the Powers regarding their respective insular possessions in the Pacific and also that in case a dispute arose regarding such rights with likelihood to prove detrimental to the peaceful relations between the powers concerned, the parties involved in such a dispute should call a joint conference of the other signatories to discuss settlement of the entire issue. So far as Japan is concerned, however, this provision applies only to Karafuto, the Pescadores and her mandated islands in the Southern Pacific. The most important provision in this treaty for Japan is embodied in its fourth article which stipulates that the Anglo-Japanese alliance, which had been concluded at London on July 13, 1911, should terminate simultaneously with the conclusion of this treaty.

The Nine-Power Treaty The Nine-Power Treaty also has an important bearing on Japan in that it consolidated the open door policy in connection with China, where Japan has greater interests than any other foreign country, especially in Manchuria. This treaty was invoked against Japan both by the United States and the League of Nations in connection with the Manchurian incident.

In the first article of this treaty, what are known as Root's four principles were incorporated, providing, first, that the sovereignty and independence as well as the territorial and political integrity of China should be respected, second, that most perfect and unrestricted opportunities should be offered China in order that she might be able to establish and maintain a powerful and stable government, third, that efforts should be made to establish and maintain the principle of equal opportunity for commerce and industry to be undertaken by people of all nationalities throughout the territory of China, and fourth, that the signatories should refrain from utilizing conditions in China to seek special rights or interests detrimental to the interests of the subjects or citizens of other friendly nations, or from recognizing actions detrimental to the welfare of such friendly nations.

The Immigration Question In view of the agitation in the United States against Japanese labour, the Tokyo Government has taken every precaution not to aggravate this issue and from 1907, when what is known as the "Gentleman's Agreement" was concluded, Japan continued to restrict emigration to the United States by withholding passports from intending emigrants above a limited number.

However, on August 19, 1913 the State of California promulgated the Alien Land Law (the Webb Bill) prohibiting Japanese and other aliens ineligible for citizenship from own-

Digitized by Google

ing land, in spite of three protests by Baron Sutemi Chinda, Japanese Ambassador in Washington. In 1919, the Japanese Government took the further precaution of stopping the emigration of so-called "picture brides" to the United States, but nevertheless an ever increasing anti-Japanese sentiment continued to prevail in the United States, and on April 19, 1920, the Federal Immigration Bureau revised the regulations governing the entry of the adopted children of Japanese parents. Moreover, the State of California enacted a second law of exclusion barring the Japanese and other aliens from leasing land, or owning land in the name of corporations or from operating land owned in the name of their American-born children.

The immigration problem assumed its greatest gravity in 1924, when the United States Congress passed a new federal immigration law, which included a provision absolutely prohibiting immigration of Japanese labourers. While this bill was before Congress, the Japanese Government instructed its ambassador at Washington, Mr. Masanao Hanihara, to call the attention of the United States Government to the importance attached by the Japanese to the proposed legislation. The steps taken by Mr. Hanihara, however, resulted in provoking the American sentiment owing to a phrase "grave consequences" which he used inadvertently in a communication to the Secretary of State, Mr. Hughes.

When the United States President signed the bill on May 24, 1924, the Japanese Government sent in a strong protest but could not improve the situation in any way. The Japanese people took this action on the part of the United States as a serious insult to their national honour.

A resolution calling for ejection of Japanese farmers for the next 10 days from Arizona farmlands was adopted at a convention of about 200 American tenant farmers near Phoenix, the capital of Arizona State in the United States, on August 15, 1934. A movement of forcing Japanese farmers out of their farmlands was subsequently staged several times. These American farmers approached the Governor of the State to recognize their movement, but, when he rejected their petition they resorted to direct action to force Japanese farmers out. The situation then spread to California and in February, 1935, an anti-Japanese exclusion bill was submitted to the Californian State Legislature. The bill provided for an absolute prohibition of Japanese people from engaging in agriculture under any circumstances. The exclusion bill was submitted to an agriculture committee of the Lower House and then was turned over to a judicial committee. Finding that the bill was too exacting and aimed at depriving the Japanese farmers of the right of agriculture, the committee doubted it might conflict the U. S. Constitution and submitted it to the plenary session of the Californian State Lower House with a desiratum for amendment, but it was shelved at the Upper House. The problem thus was apparently solved, but the exclusion tendency against Japanese was growing keener. Even Japanese who legally entered that country and are engaged in peaceful vocations are not given treatment the same as that accorded the American citizens.

Other Issues The attempted intervention in the Manchurian and Shanghai affairs in 1931 and 1932 by the American Secretary of State, Col. Henry L. Stimson, at one time

Digitized by Google

seemed to menace seriously the relations between Japan and the United States.

Hirota-Hull Messages As soon as Mr. Koki Hirota took office as Foreign Minister he commenced to devote himself to strengthening Japan's friendly relations with her neighbouring countries. As one of the manifestations of such endeavour, he sent, through Mr. H. Sato, the new Ambassador, his personal message to Mr. Hull, the Secretary of State of the United States, on February 21, 1934:

"I firmly believe that, viewed in the light of the broad aspect of the situation and studied from all possible angles, no question exists between our two countries that is fundamentally incapable of amicable solution. I do not doubt that all issues pending between the two nations will be settled in a satisfactory manner, when examined with a good understanding on the part of each of the other's position, discussed with an open mind and in all frankness, and approached with a spirit of co-operation and conciliation."

To this, Secretary Hull replied on March 3 with his personal message in the form of a letter, to Mr. Hirota, a summary as follows:

"I believe that there are in fact no questions between our two countries which, if they be viewed in proper perspective in both countries, can with any warrant be regarded as not readily susceptible to adjustment by pacific processes."

The Manchurian Incident

What is known as the "Manchurian Incident" broke out with the blasting of a section of the South Manchuria Railway near Liutiaokou by Chinese regular troops on September 18, 1931. It has brought about the foundation of a new nation in Manchuria and the withdrawal of Japan from the League of Nations. The incident though called in the singular was not really a single incident, but a series of incidents which followed one another after the unexpected outbreak, the inevitable sequel to long-continued and growing anti-Japanese activities on the part of the old Mukden militarists.

The hostilities which occurred in Shanghai in January, 1932, as well as the threatening situation in Tientsin some time earlier were only two of the manifold ramifications of the "Manchurian Incident." The state of affairs known as the Manchurian Incident continued until the truce concluded on May 31, 1933, at Tangku between the Japanese and Chinese forces, which to all intents and purposes wound up the Jehol expedition carried out by the combined Japanese and Manchoukuo armies to pacify the province and protect the provincial people from local banditry and invading troops from the south across the Great Wall.[1]

Founding of Manchoukuo

The Manchurian Incident having resulted in the over-throw of the old régime of Chang Hsueh-liang, various groups came to declare independence in different districts of Manchuria.

The chief principles of the projected new government called for the suppression of the military cliques, co-operation with the rest of the world in line with the principle of the open door and equal opportunity for all, elimination of anti-foreignism, and promotion of the welfare of the people in place of the oppression and grinding taxation from which they had hitherto suffered.

Thus, on March 1, 1932, a manifesto was promulgated announcing

1 For particulars of the incident see the Japan Year Book, 1933, Chapter VII.

Digitized by Google

that Manchoukuo was founded in response to the unanimous aspirations of the 30,000,000 people of Manchuria and Mongolia. On March 7, Mr. Henry Pu-yi, who had once reigned over the entire territory of China as the 12th Emperor of the Ching dynasty, consented to become the Chief Executive of Manchoukuo. This was followed by the installation in office of Mr. Henry Pu-yi and the ceremony celebrating the founding of Manchoukuo at Changchun on March 9. (For particulars see Chapter on Manchoukuo.)

Japan and Manchoukuo

The Japanese Envoy On August 8, 1932, General Nobuyoshi Muto was appointed commander of the Kwantung army with concurrent offices as Ambassador Extraordinary and Minister Plenipotentiary to Manchoukuo and Governor of the Kwantung Leased Territory.

Recognition of Manchoukuo The Japanese Government extended de jure recognition to Manchoukuo on September 15, 1932, when the protocol completing this procedure was signed at the Chief Executive's offices in Hsinking between General Muto representing Japan and Premier Cheng Hsiao-hsu representing Manchoukuo.

The official English translation of this protocol follows :

Whereas Japan has recognized the fact that Manchoukuo, in accordance with the free will of its inhabitants, has organized and established itself as an independent State ; and

Whereas Manchoukuo has declared its intention of abiding by all international engagements entered into by China in so far as they are applicable to Manchoukuo ;

Now the Governments of Japan and Manchoukuo have, for the purpose of establishing a perpetual relationship of good neighbourhood between Japan and Manchoukuo, each respecting the territorial rights of the other, and also in order to secure the peace of the Far East, agreed as follows :

1. Manchoukuo shall confirm and respect, in so far as no agreement to the contrary shall be made between Japan and Manchoukuo in the future, all rights and interests possessed by Japan or her subjects within the territory of Manchoukuo by virtue of Sino-Japanese treaties, agreements or other arrangements or of Sino-Japanese contracts, private as well as public ;

2. Japan and Manchoukuo, recognizing that any threat to the territory or to the peace and order of either of the High Contracting Parties constitutes at the same time a threat to the safety and existence of the other, agree to co-operate in the maintenance of their national security ; it being understood that such Japanese forces as may be necessary for this purpose shall be stationed in Manchoukuo.

The present Protocol shall come into effect from the date of its signing.

The present Protocol has been drawn up in Japanese and Chinese, two identical copies being made in each language. Should any difference arise in regard to interpretation between the Japanese and the Chinese texts, the Japanese text shall prevail.

The Shanghai Affair

The Causes Anti-Japanese feeling in China was increasingly accentuated following the Wanpaoshan affair, the conflict between Koreans and Chinese in Chosen and the Manchurian incident in particular. Among other places Shanghai was the scene of most vigorous and or-

Digitized by Google

ganized anti-Japanese activities, which culminated in the publication of an article disrespectful to the Imperial family of Japan by the Minkuo Jipao, a Chinese newspaper in Shanghai, in January, 1932. Shortly afterwards there occurred an assault on two Japanese Buddhist priests and three Japanese Buddhist believers of the Nichiren sect by a mob of workers of the Sanyu Business Company, manufacturers of towels, on January 18, when all of the Buddhist group were seriously wounded, one of them dying later on January 24.

Indignation among the Japanese residents in Shanghai over this outrage was such that they immediately held a mass meeting and lodged a strong protest with Wu Tieh-cheng, mayor of Shanghai.

The Ultimatum Consul-General Murai had filed an official protest with Mayor Wu of Shanghai demanding an apology from the mayor, the arrest and punishment of the marauders, payment of solatiums and expenses of medical treatment for the injured and also immediate dissolution of anti-Japanese organizations.

Seeing the general situation, Consul-General Murai sent an ultimatum to the Chinese with a time limit set for 6 p. m. on January 28 and received a reply from Mayor Wu promising to suppress the anti-Japanese agitators and accept all the Japanese demands.

Opening of Hostilities On the evening of January 28, however, Chinese crowds gathered around the municipal offices of Shanghai loudly accusing the mayor of having weakly yielded to the Japanese, and a serious situation threatened to prevail in all parts of the city, with the result that the Municipal Bureau of the International Settlement had to declare a state of siege, the foreign garrison forces taking up their positions in their respective areas of defence.

The situation, however, went from bad to worse, and the Japanese and Chinese troops came into a collision, which lasted from January 29 to March 3, when the former completely drove out the latter from the Chapei district.

On the completion of this achievement, General Shirakawa, commander of the Japanese expeditionary forces, and Vice-Admiral Nomura, commander of the Japanese fleet, ordered suspension of all hostilities at 2 p. m. on March 3.

Sino-Japanese Issue and the League

Japan's Attitude Following the outbreak of the Manchurian Incident, the Council of the League of Nations held an urgent session in compliance with a request of Dr. Alfred Sze, the Chinese representative, on September 22, 1931.

The League Adjourns Following the publication of the statement of the Tokyo Government, the intentions of Japan gradually came to be understood by the Powers, and the League Council adjourned on September 30 after adopting a resolution.

Activities of Council The situation, however, threatened to grow worse when, on October 8, the air raid on Chinchow was reported, and on the following day Japan lodged a protest against the anti-Japanese movement and sent a naval force to South China.

For three days from October 14, the Council discussed the question of the proposal to invite an observer of the United States to attend the Council meeting. The Japanese representative objected to this proposal from a juridical viewpoint, but at a private session held on the 15th,

Digitized by Google

the Council passed this proposal as a question of "procedure" by a majority vote with Japan alone dissenting.

Accordingly the United States was represented by Mr. Prentiss Gilbert, the American consul-general at Berne, as an observer at the Council meeting from October 16.

At its private session on October 17, which is known as the 13-power conference because of the absence of the Japanese and Chinese representatives, the Council, with the attendance of the American observer, resolved that the 13 Powers take steps to call the attention of Japan and China to the Kellogg-Briand anti-war pact with regard to the Manchurian situation.

Consequently the Powers interested sent notes to Japan and China to that end, and the Japanese Government replied to these notes on the basis of a decision reached at an urgent meeting of the Cabinet held on October 22.

Briand's Proposal In the course of this conference M. Briand proposed a tentative plan to Mr. Yoshizawa, suggesting that Japan recognize the sovereignty of China in Manchuria, that China suppress her anti-Japanese agitation, boycott and anti-Japanese education, that China guarantee the safety of the lives and property of the Japanese nationals in China, that China recognize the right of Japanese nationals to reside, travel and engage in business in Manchuria, and that China confirm before the League of Nations the rights vested by all the existing treaties including what is known as the "Twenty-one Demands."

There were indications of these five proposals, if accepted by China, proving instrumental in improving the situation by making it possible for Japan to start direct negotiations with China regarding the concrete procedure of the withdrawal of the Japanese troops.

The situation, however, underwent a sudden change for the worse for an unknown reason, and at its session of October 22 the Council proposed to make Japan complete the withdrawal of her troops by November 15 with neutral observers seeing to it that perfect peace and order would be maintained after the Japanese evacuation, and to make Japan and China appoint their respective representatives to take charge of the evacuation of the occupied area, it also being suggested that Japan and China start direct negotiations immediately after the completion of the evacuation.

These proposals were regarded as the most disadvantageous ones to Japan that had ever been considered by the Council.

The Counter Proposal Against this, the Japanese representative, Mr. Yoshizawa, submitted a counter-proposal to the Council on the 23rd to the effect that the Japanese Government should withdraw those of its troops still remaining in a few localities outside the railway zone as the then-prevailing atmosphere of tension cleared and the situation improved, by the achievement of a previous understanding between the Chinese and Japanese Governments as regards the fundamental principles governing normal relations, that the Japanese and Chinese Governments should confer together at once with a view to arriving at the understanding as mentioned above, and that the Japanese and Chinese Governments should appoint representatives to arrange the details of execution of the evacuation and of taking over the districts evacuated.

The Japanese counter-proposal was defeated by a vote of 13 to 1,

Digitized by Google

and the Council's resolution also failed to pass by a unanimous vote, the vote being 13 to 1 in favour of the Council proposal, the Japanese representative dissenting.

The "Fundamental Principles"

The Five Principles Following this, the Japanese Government published a statement on October 26, regarding the "fundamental principles" In this statement Japan made it clear that these so-called "basic principles" related to :

1. Mutual repudiation of aggressive policy and conduct.
2. Respect for China's territorial integrity.
3. Complete suppression of all organized movements interfering with freedom of trade and stirring up international hatred.
4. Effective protection throughout Manchuria of all peaceful pursuits undertaken by Japanese subjects.
5. Respect for the treaty rights of Japan in Manchuria.

Resolution of December 10

Tension Continues The League of Nations' Council held its third session to discuss the Sino-Japanese issue on November 16, 1932. Whereas League circles had been looking to the withdrawal of the Japanese troops by that date, the situation in Manchuria was such that Japan could not live up to their expectation, with the result that a frontal clash threatened to take place between Japan and the League of Nations.

In this connection League circles were reported advocating severance of economic relations with Japan, withdrawal of diplomatic representatives from Japan or exclusion of Japan from the League. These reports were met by an outburst of strong nationalistic sentiment in Japan and serious tension prevailed.

The Council met on November 16 as scheduled amid an atmosphere of such tension and was continued until December 10.

The Resolution Before adjourning, the Council adopted a resolution by a unanimous vote on December 10. This resolution in effect provided that the Japanese Government should withdraw its troops within the railway zone in proportion as the safety of the lives and the protection of the property of Japanese subjects were effectively secured and that the two parties should undertake to adopt all measures necessary to avoid any further aggravation of the situation and to refrain from any initiative which might lead to further fighting and loss of life.

Regarding this resolution, the Japanese representative declared that his Government accepted the resolution on the understanding that it would not prevent the Japanese military authorities from taking action in defence of lives and property of Japanese nationals against bandits and other lawless elements rampant in various parts of Manchuria.

Opinion Adverse Just after the League Council met in its 66th regular session on January 25, 1932, troubles broke out in Shanghai and Mr. W. W. Yen, the Chinese representative, appealed to the Council on January 29 to invoke Article 15 of the League Covenant in regard to the affair.

Thus, at the Council meeting on January 30, it was decided that only the first paragraph of Article 15 of the Covenant would be invoked, in regard to the Shanghai incident alone. Accordingly, representatives of the neutral members of the Council organized an international committee at Shanghai to gather information on the spot and submit

Digitized by Google

it to the Council.

This committee sent in four reports successively, first under date of February 6, second under date of February 12, third under date of February 20 and fourth under date of March 6. Of these, the first report was very favourable to Japan, but the second report proved decidedly unfavourable to Japan, it declaring that the Japanese and Chinese troops had been in a state of open hostilities since February 3.

Consequently, the Council caused the representatives of the 12 members of the Council other than Japan and China to address an appeal to Japan on February 16, regretting that it appeared that Japan could no longer trust to the peaceful settlement to be provided by the League of Nations.

Japan's Refutal Thereupon, in a statement published on February 23, the Japanese Government refuted this appeal in detail asserting that, although China had been treated in the past, by common consent, as if the expression connoted an organized people, such fictions could not last forever, nor could they be tolerated when they became grave sources of actual danger. Thus the Japanese Government declared that the time had inevitably come when realities, rather than fictions, had to be reckoned with.

Views unfavourable to Japan were also expressed in various quarters about that time, and Japan's relations with the League of Nations seemed seriously menaced.

The Shanghai Armistice

A Parley Proposed On February 27, 1932, the Japanese delegation at Geneva unofficially notified the representatives of the 12 member Powers of the Council that Japan was willing to participate in a round-table conference if the Powers would sponsor such a parley at Shanghai.

The armistice conference was officially opened at Shanghai on March 24, but the progress of the parley was delayed owing to a divergency of opinion between the Japanese and Chinese delegates regarding the time to be fixed for the final withdrawal of the Japanese troops.

During this period of deadlock China made a sudden appeal to the League of Nations on April 11, reporting a rupture of the conference.

The Mixed Committee On receipt of this appeal, the Committee of 19, organized by the League Assembly on March 11 to continue in charge of the entire Sino-Japanese issue, immediately accepted this representation and opened a session on April 16 to discuss the situation.

At its session on April 19, the Committee of 19 drafted a resolution for the Assembly with the object of breaking through the reported deadlock between Japan and China.

This proposal was met by strong opposition from the Japanese Government as well as the military and public opinion of Japan, and another crisis arose between Japan and the League of Nations. But the situation was improved and the League Assembly adopted the Lampson plan by a unanimous vote on April 30. The crisis having thus passed, the armistic conference was resumed at Shanghai on April 28, and despite the occurrence of the tragic bombing outrage on the occasion of the celebration of the Emperor's birthday on April 29, an armistice was finally signed on May 5, 1932.

The League Commission of Inquiry

The League of Nations' Commission of Inquiry, appointed in line with the resolution of December 10,

Digitized by Google

1931, and comprising the Earl of Lytton of Great Britain, Général de Division Henri Claudel of France, Major-General Frank Ross McCoy of the United States, Dr. Heinrich Schnee of Germany and Count Pldrovandi of Italy, arrived in Japan on February 29, 1932, accompanied by a party of their secretaries. The Commissions left Japan for China on March 11, and spent about four months to make investigations in China and Manchuria.

Preliminary Report What the Commission learned was presented to the League of Nations on April 29 as a preliminary report.

In the course of this preliminary report, the Enquiry Commission stated that Manchuria was not under the authority of the Nanking Government and was infested by banditry, so that the Japanese troops could not be withdrawn, adding that the Nanking Government did not exercise its power in any part of Manchuria in the prevailing situation.

The Final Report The full text of the final report of the Commission was published at 9 p.m., Tokyo time, on October 2 in Tokyo, Geneva and Nanking simultaneously.

The contents of the report were considered comparatively impartial in its description of the outline of the history of the Sino-Japanese relations, Japan's interests in Manchuria and the general observations of the prevailing situation.

However, that the Commission gave only a cursory account of the Shanghai incident, as if this incident had been outside the scope of its investigation work, was taken to show that the Commissioners did not fully understand what their true mission was.

Further, the failure of the Commissioners to recognize the military action taken by Japan on September 18, 1931, which was dealt with in the fourth chapter of the report, as an act of self-defence, was highly resented in Japan. It was also generally held both in official and private circles in Japan that the sixth chapter of the report, in so far as the description of the circumstances pertaining to the founding of Manchoukuo was concerned, was full of prejudiced misrepresentations and that the last two chapters containing what they called "principles and conditions of settlement" and "considerations and suggestions to the Council" were for this reason practically superfluous, especially after the de jure recognition recently extended to Manchoukuo by Japan.

Report and League

Resolution of February 24 Following the publication of the Lytton Report, the League of Nations started its discussion thereon at the Council meeting convened on November 21, 1932, and, after complicated proceedings through the Assembly, the Committee of Nineteen and other committee meetings, a report with several recommendations was adopted by a vote of 42 to 1 on February 24, 1933, at the Assembly meeting, at which Siam abstained from voting and 12 countries were not represented.

The report was on the whole based upon the Lytton Report and was distinctly unfavourable for Japan and Manchoukuo, one of the recommendations contained therein purporting to recognize Chinese sovereignty and administrative integrity in Manchuria.

Japan's Withdrawal After voting against the report of the League of Nations Assembly on the Sino-Japanese dispute, the Japanese delegation to the League meetings, headed by Mr. Yosuké Matsuoka, left Geneva without attending further

Digitized by Google

meetings of the League, thereby expressing the firm determination of Japan.

In Japan, the Government decided on severance from the League of Nations and submitted a project to this end to the Throne. Accordingly the Privy Council met in plenary session on March 27, 1933, in the presence of the Emperor to recommend the project for Imperial sanction with a unanimous vote.

The Throne immediately sanctioned the project, a telegram was dispatched to Geneva addressed to the Secretary-General of the League of Nations notifying the body of Japan's withdrawal from its membership, and simultaneously with this the Emperor issued an Imperial rescript announcing the policy to be followed by Japan after this action.

The official translation of the Imperial rescript follows:

"When the League of Nations came into being upon the restoration of a general peace, Our Imperial Father was pleased to order the entry of Our Empire thereinto; and We, in Our turn, have laboured assiduously to fulfil the high purpose of the late Emperor. It is thus that Our Empire has for these thirteen years past extended consistently its co-operation to the League.

"Now Manchoukuo having of late been founded, Our Empire deems it essential to respect the independence of the new state and to encourage its healthy development, in order that the sources of evil in the Far East may be eradicated and an enduring peace thereby established. Unhappily, there exists between Our Empire and the League of Nations a wide divergence of view in this regard and it has devolved upon Us to cause Our government to take, upon mature deliberation, the necessary steps for the withdrawal of Our Empire from the League.

"However, the advancement of international peace is what, as evermore, We desire, and Our attitude toward enterprises of peace shall sustain no change. By quitting the League and embarking on a course of its own, Our Empire does not mean that it will stand aloof in the extreme Orient nor that it will isolate itself thereby from the fraternity of nations. It is Our desire to promote mutual confidence between Our Empire and all the other Powers and to make known the justice of its cause throughout the world.

"Every country is overtaken today by emergencies of an unprecedented magnitude. Our Empire itself is confronted by a situation fraught with momentous possibilities. It is indeed an hour that calls for an intensification of effort on the part of Our entire nation. We command that all public servants, whether civil or military, shall faithfully perform each his appointed duty, and that all private citizens shall pursue their wonted tasks with diligence. Stray not, in advancing, from the path of rectitude; and in action, embrace always the golden mean. Strive to meet the present situation with a united will and with courage and resolution. So may ye carry forward the glorious work bequeathed by Our Grandsire and contribute to the prosperity and well-being of Mankind."

Jehol and Tangku Truce

Jehol Expedition The expedition carried out by the joint forces of Manchoukuo and Japan to Jehol to pacify this province of the new nation, and the subsequent truce concluded at Tangku between the hostile Chinese troops and the Japanese expedition on May 31, 1933, practically

Digitized by Google

put an end to the long-protracted state of affairs popularly known as the Manchurian Incident.

The Jehol expedition, which was launched following a declaration to this end made by the Manchoukuo Government on February 26, 1933, announcing that it was dispatching without delay necessary forces "to exterminate completely all bandits within and to dislodge all the invading armies from the province," was executed with amazing speed and on March 4 a Japanese contingent occupied Chengte, the capital of the province; a few days later the Japanese troops taking several important positions along the Great Wall.

After having been driven out of the province almost without any resistance, however, the Chinese troops continued hostile operations on the Great Wall positions from the south, and the Japanese forces were obliged to advance south across the Great Wall more than once to destroy the bases of Chinese hostilities.

The Truce In fact, on the second occasion the Japanese advanced within a few miles of Peiping and Tientsin, but they refrained from actually entering these cities, and instead succeeded in inducing the representatives of the Chinese forces to sign a truce on March 31 at Tangku, providing for a demilitarized zone between the Peiping and Tientsin districts and the Great Wall.

After ascertaining the intentions of the Chinese authorities to carry out the terms of the truce, the Japanese forces withdrew to the Great Wall line, true to their repeated declaration that they had no ulterior intention other than to maintain peace in Jehol.

Meanwhile, the Manchoukuo authorities, immediately after the pacification of Jehol, started a constructive programme in the province, readjusting finances and mapping out plans for future industrial and economic development for the provincial people.

Mending of Sino-Japanese Relations

Solution of Pending Questions There are many issues that have been pending between Japan and China since the signing of the Tangku truce pact on May 31, 1933. Because of China's non-recognition of Manchoukuo, Sino-Manchoukuo relations are still officially at a deadlock. Pressed, however, by necessity, the through railway connection problem was solved in June, 1934, as the result of negotiations between Japan and China, and since July 1 of that year the Sino-Manchoukuo International Train Service has been in operation between Mukden and Peiping. This was followed by the Frontier Customs question which was solved in December of that year. By this the trade relations of China and Manchoukuo are going on smoothly. The Sino-Manchoukuo Postal question was also solved and the postal service has been in operation since January 1, 1935.

Exchange of Ambassadors In July, 1924, Japan and China agreed on the exchange of ambassadors between them, but, due to the subsequent internal relations of China, the matter failed to be realized. Sino-Japanese relations assumed a sudden turn for the better since early in 1935. Taking advantage of this situation, Foreign Minister Koki Hirota made a proposal to the Nanking Government for promotion of the Japanese Legation in China to the status of an embassy. Both sides agreed on this. The matter was formally announced in Tokyo and Nanking at the same time on

Digitized by Google

May 17. The Japanese Government promoted Mr. Akira Ariyoshi, Minister to China, to Ambassador, and the Chinese Government promoted General Tsiang Tso-pin, Chinese Minister to Tokyo, to Ambassador. At the initiative taken by Japan, both Great Britain and the United States at once promoted their Ministers in China to Ambassadors.

North China Incidents

Causes of the Incidents Infringement of the Tangku truce pact on the Chinese side and violation of an official note exchanged between the Japanese and Chinese Governments regarding the retrocession of Tientsin in 1902 were the real causes of the North China incidents. Sun Yung-chin, bandit chieftain, with his followers, was expelled from Jehol Province by Japan-Manchoukuo combined forces to Shunhua in Hopei Province, where he was given support of a peace preservation corps under General Yu Hsueh-chung, chairman of the Hopei Provincial Government. It was discovered that General Yu supplied him with ammunition and foodstuffs. The Sun banditry, however, was subjugated by the Kwantung Army late in May, 1935. It was also found that General Ho Ying-chin, chairman of the Peiping branch of the National Military Council, had been giving bandits in Manchoukuo certificates of the Northeastern Volunteer Corps. All these were glaring instances of infringement of the Tangku truce pact. Another event that made the North China situation serious was assassination of two pro-Japanese Chinese journalists. On May 3 Mr. Pei Yu-han, president of the Tientsin Hsin Pao, a Chinese daily, and Mr. Hu Ching-pu, president of a Chinese magazine, the Kuo Hsien, were assassinated in the Japanese Concession, in Tientsin, by Chinese terrorists belonging to the Blue Shirt Party and Third Peiping Gendarmery in concert with other similar secret societies. Mr. Pei was an employee of the Japanese army. This was China's violation of the official note regarding the retrocession of Tientsin.

Japan's Notification Colonel Takahashi Sakai, chief-of-staff of the Japanese Garrison in Tientsin, and Major Tan Takahashi, Japanese resident army officer in Peiping, called on General Ho on May 29 and blamed a dual policy of Generalissimo Chiang Kai-shek towards Japan, pointing out these two anti-Japanese facts. They handed the following demands of Japan to the General Ho:

1. Dismissal of Yu Hsueh-chung who is directly responsible for the incidents and the evacuation of the Central Army of China from Hopei Province.

2. Dismissal of Chang Tingyo, Mayor of Tientsin, and Li Chun-yo, Director of the Tientsin Public Peace Bureau, both directly responsible for the assassination.

The Nanking Government attempted to decline these demands by all means, but, because of a concertedly strong attitude of the Japanese Government, it could not see any way but to entirely accept the Japanese demands. On June 10 the Nanking Government replied that it accepted all what Japan demanded.

Chahar Incident

Soldiers of General Sung Cheyuan, Chairman of the Chahar Provincial Government, illegally arrested officials of the Kwantung Army on June 5, 1935, and incarcerated them at Changpei, north of Kalgan (Changchiakow). On June 11 and 12 his soldiers entered Manchoukuo and opened fires on officials of the Manchoukuo Government. The Kwantung Army instructed Colonel

Digitized by Google

Gennosuke Matsui, resident army officer in Kalgan, to demand Chahar Government authorities to make clear their responsibility for the incident. Simultaneously, the Kwantung Army notified the Nanking Government of its firm determination to carry through its object unless the latter expressed its sincerity. This caused the Nanking Government to hold an important conference among leading statesmen of the Executive Yuan on June 18 and to dismiss General Sung Che-yuan from his post as Chairman of the Chahar Provincial Government. The 132nd Division under his command was transferred elsewhere. On June 23 Major-General Kenji Doihara, of the Kwantung Army, met General Chin Te-chun, successor to General Sung, in Peiping, and, as the result of negotiations, the Nanking Government accepted the Japanese demands entirely on June 27. Thus, the North China issues were solved peacefully, promising the development of five North China provinces, namely, Hopei, Chahar, Suiyuan, Shantung and Shansi, to go on steadily through the Sino-Japanese economic co-operation.

Shanghai Lese Majeste Affair

A Chinese weekly magazine Hsin Sheng (New Life), published in Shanghai, printed an article containing lese majeste to the Imperial Court of Japan in its 15th number dated May 4, 1935. A vigorous protest was filed by Consul-General Itaro Ishii in Shanghai with Mayor Wu Te-chen, of Shanghai, against the magazine article on June 24, 1935. As it was found that the censor of magazines in Shanghai was in the hand of the propaganda committee of the headquarters of the Kuomintang and that the responsibility was to be assumed by the Kuomintang, the negotiations were made by Ambassador Akira Ariyoshi with the National Government, Nanking. Mr. Tang Yu-jen, Foreign Vice-Minister of the National Government, issued the following statement:

"That the lese majeste incident broke out is deplorable indeed. To the Japanese nation anything that impairs the dignity of its Imperial Court is absolutely unbearable. Therefore, the Nanking Government recognizes a very serious nature of the matter and is prepared to take possible steps to properly settle it."

Mr. Yeh Su-tsao, presiding member of the Central Propaganda Committee of the Kuomintang, as a man directly responsible for the censorship of the magazine, filed a formal note of apology for the lese majeste affair with Ambassador Ariyoshi on July 8, and at the same time he dismissed six men in charge of the censorship. The headquarters of the Kuomintang also issued instructions to all provincial branches of the party warning them not to make any more allegation of such a sort of propaganda. The Japanese side took the action as reasonable and thus the matter was settled.

Chronological Index of Principal Events

For the convenience of reference a chronological index of principal events in the country's foreign relations is appended:

OPENING OF THE COUNTRY

1853—Arrival of American fleet.
1854—First Japanese-American Treaty.
1856—Arrival of first American civil envoy, Townsend Harris.
1857—Harris concludes convention with the Shogunate.
1858—Japanese-American Commercial Treaty signed.

OCCUPATION OF TSUSHIMA BY RUSSIA

1861—A Russian fleet seizes the island of Tsu-

Digitized by Google

shima but abandons it shortly afterwards through the intervention of Great Britain.

BOMBARDMENT OF KAGOSHIMA AND SHIMONOSEKI
1863—A British fleet bombards Kagoshima city.
1864—A combined fleet of Great Britain, the United States, France and the Netherlands bombards Shimonoseki.

IMPERIAL SANCTION OF TREATIES
1865—Treaties with Britain, France, the Netherlands, Russia and the United States are sanctioned by the Emperor.

TREATY REVISION
1871—Prince Iwakura's mission leaves for the United States and Europe.
1882—Count Inouyé's Negotiations with Britain.
1888—Count Okuma's Negotiations.
„ Viscount Aoki's Negotiations.
1894—Revised Anglo-Japanese Treaty signed.
1897—Similar Treaties concluded with other Powers

THE PERUVIAN SLAVE SHIP INCIDENT
1872—Japanese Government seizes Peruvian slaver "Maria Luz" in Yokohama.

EXPEDITION TO TAIWAN
1872—Japan sends a punitive expedition to the island.

EXCHANGE OF SAGHALIEN AND THE KURILE ISLANDS
1875—Japan cedes Saghalien to Russia in exchange for the Kurile Islands.

BONIN ISLAND PROBLEM
1875—The United States recognizes Japan's territorial sovereignty over the Bonin Islands.

CONVENTION OF TIENTSIN
1885—Count Ito and Li Hung-chang sign the convention defining Sino-Japanese relations in Korea.

NON-ALIENATION OF FUKIEN PROVINCE
1889—Japan guarantees the non-alienation of Fukien province from China.

SINO-JAPANESE WAR
1894—Japan declares war.
1895—Treaty of Shimonoseki concluded.

ANGLO-JAPANESE ALLIANCE
1902—Alliance signed in London.

RUSSO-JAPANESE WAR
1904—Japan declares war.
1905—Treaty of Portsmouth signed.

JAPANESE-AMERICAN ARBITRATION TREATY
1905—Treaty signed in Washington, D. C. on Feb. 11.

PROTECTORATE OF KOREA
1905—Protectorate convention concluded.

PEKING TREATY
1905—Sino-Japanese convention embodying relevant terms of Portsmouth Treaty signed.

EXCLUSION OF JAPANESE SCHOOL CHILDREN IN CALIFORNIA
1906—Movement is started in California for exclusion of Japanese children from common schools.

FRANCO-JAPANESE AND RUSSO-JAPANESE AGREEMENTS
1907—Franco-Japanese Convention concluded.
1907—Russo-Japanese Agreement concluded.

NEW JAPAN-KOREAN AGREEMENT
1907—New Agreement concluded allowing Japan complete supervision of Korean domestic administration.

IMMIGRATION PROBLEM IN CANADA
1907—Japan exchanges on Dec. 3 a memorandum with Canada in connection with the immigration problem.

U.S.-JAPAN ARBITRATION TREATY
1908—Treaty concluded on Sep. 12.

JAPAN-AMERICAN ACCORD
1908—Official Notes exchanged regarding the preservation of peace in the Far East.

ANTUNG-MUKDEN RAILWAY ISSUE
1909—An agreement is signed on Aug. 15 between Japan and China regarding the Antung-Mukden Railway.

PROPOSAL TO NEUTRALIZE THE SOUTH MANCHURIA RAILWAY
1910—Japan refuses on Jan. 21 to accept the proposal of Secretary of State Knox of the United States regarding neutralization of the South Manchuria Railway.

RUSSO-JAPANESE AGREEMENT
1910—A new agreement is concluded on July 4 between Japan and Russia regarding the maintenance of the status quo in Manchuria.

FINAL TREATY REVISION
1910—Japan notifies Great Britain and 10 European countries on July 17 that existing treaties will be revised a year later. On August 4, similar notices are served to France and Austria-Hungary.

ANNEXATION OF KOREA
1910—Treaty of Annexation concluded.

INTERNATIONAL COPYRIGHT TREATY
1910—Japan signs the International Copyright Treaty in Berlin on September 8.

FRANCO-JAPANESE AGREEMENT REGARDING PATENTS AND COPYRIGHT
1911—An agreement is concluded on May 8, regarding patents and copyright in China.

Digitized by Google

NEW ANGLO-JAPANESE TREATY
1911—Treaty concluded on the basis of the arbitration treaties between Great Britain and the United States.

PUBLICATION OF THE REVISED TREATIES
1911—The United States publishes revised treaty with Japan on April 5. Great Britain, Spain, and Sweden do likewise on April 6, May 15 and July 13 respectively. Italy, Belgium, Denmark, the Netherlands, Switzerland and Canada publish revised treaties with Japan simultaneously on July 15, followed by Germany, Austria-Hungary and France on July 16, August 3, and August 26 respectively.

SETTLEMENT OF RUSSO-JAPANESE INDEMNITIES
1911—The Foreign Office announces that the amounts of the indemnification of private Russian and Japanese subjects for damage done during the Russo-Japanese War have been determined.

RECOGNITION OF THE REPUBLIC OF HUNGARY
1911—Japan accords recognition on September 13.

RUSSO-JAPANESE EXTRADITION CONVENTION
1911—Convention concluded on September 13.

ANTI-JAPANESE ALIEN LAND LAW IN CALIFORNIA
1913—Passage of the so-called Webb Bill.

NANKING INCIDENT
1913—Negotiations regarding the Kuchow, Hankow and Nanking incidents are concluded on October 7, the Chinese accepting all the Japanese demands.

MANCHURIA RAILWAY TREATY
1913—A treaty is concluded between Japan and China regarding the railway building concessions.

RECOGNITION OF THE CHINESE REPUBLIC
1913—Japan recognizes the Republic of China on October 6 simultaneously with the election of Yuan Shih-kai as President.

ABOLITION OF FOREIGN SETTLEMENTS IN CHOSEN
1914—The protocol abrogating the foreign settlements in Chosen, signed on April 20 the preceding year, is published.

THE GREAT WAR
1914—Japan declares war on Germany and Austria.

SINO-JAPANESE PARLEYS
1915—The Chinese Government requests Japan on January 3 to delimit the war zone in Shantung and withdraw her troops from that zone. Accordingly, Minister Hioki in Peking holds a conference with Yuan Shih-kai on January 18 to discuss Japan's counter proposals. Japan serves an ultimatum on May 6, and the Chinese Government accepts all the Japanese proposals.

SPANISH-JAPANESE TREATY
1915—Ratifications of a commercial treaty are exchanged on July 10.

ANTI-INDEPENDENT PEACE AGREEMENT
1915—Japan participates on Oct. 19 in the agreement of the Allied powers signed in London prohibiting the signatories from concluding a separate peace with Germany.

WARNING TO CHINA
1915—Anticipating disturbances in connection with the apparent designs of Yuan Shih-kai to revive the Imperial government in China, Japan issues a warning to China on October 28.

PARTICIPATION IN THE ALLIED ECONOMIC CONFERENCE
1916—Baron Yoshio Sakatani leaves for Europe on May 1, to attend the Conference in Paris.

RUSSO-JAPANESE AGREEMENT
1916—The third Russo-Japanese agreement for protection of Japanese and Russian interests in the Far East is signed on July 3.

ISHII-LANSING AGREEMENT
1917—Japan and the United States exchange notes declaring that territorial propinquity creates special relation between countries. This exchange of opinion, published on November 7, is generally known as the Ishii-Lansing Agreement.

SINO-JAPANESE MILITARY ENTENTE
1918—Entente is concluded on May 16, and its text published by the Japanese Foreign Office on May 30.

SIBERIAN EXPEDITION
1918—Japanese participation announced.

DECLARATION OF THE RENDITION OF SHANTUNG
1919—Count Uchida, the Foreign Minister announces the restoration of complete Chinese sovereignty on May 17.

RECOGNITION OF FINLAND
1919—Japan recognizes the independence of the Finnish Republic on May 23.

CONTROL OF THE SIBERIAN RAILWAY
1919—The Siberian Railway Joint Control Conference decides on June 2 to place

Digitized by Google

the Ussuri line, 581.1 km. in length, and the Heilungkiang line, 2,785.6 km. in length, under the control of the Japanese experts' department of the Siberian expeditionary forces.

SEQUESTRATION OF GERMAN PROPERTY
1919—An Emergency Imperial Ordinance is issued on June 23 announcing sequestration of German property.

SIGNING OF THE PEACE TREATIES
1919—Prince Kimmochi Saionji signs the Versailles treaties at 3 o'clock in the afternoon of June 28.

PARTICIPATION IN EUROPEAN PROBLEMS
1920—Baron Chinda proposes on March 2 participation in the conference concerning the Dardanelles International Control, but the Japanese proposal is rejected owing to opposition from Great Britain, France and Italy.

DEMAND FOR THE EVACUATION OF SIBERIA
1920—The Soviet Government of Irkutsk sends an ultimatum to Japan on March 11.

NIKOLAEVSK AFFAIR
1920—Attack on Japanese consulate launched.

DECLARATION OF SIBERIAN POLICY
1920—Japanese Government issues statement re withdrawal of troops.

ANTI-JAPANESE IMMIGRATIONS
1920—Revision of regulations by the Immigration Bureau of the United States.

RENEWAL OF THE ANGLO-JAPANESE ALLIANCE
1920—The Japanese and British Governments notify the Secretariat of the League of Nations on July 14, that the duration of the Anglo-Japanese alliance will be extended for another year.

REOPENING OF THE GERMAN EMBASSY IN TOKYO
1920—Dr. Solf arrives in Japan as the first German ambassador after the Great War.

WASHINGTON CONFERENCE
1921—Conference opens with Japan participating.

THE GENEVA TRI-PARTITE NAVAL DISARMAMENT CONFERENCE
1927—Conference opens with Japan participating.

THE LONDON NAVAL DISARMAMENT CONFERENCE
1930—Conference opens with Japan participating.

THE MANCHURIAN INCIDENT
1931—Outbreak occurs at Mukden.

THE JAPAN-MANCHOUKUO PROTOCOL
1932—Protocol signed whereby Japan extends *de jure* recognition to the new State.

THE WORLD ECONOMIC CONFERENCE
1933—Conference opens with Japan participating.

THE JAPAN-INDIA TRADE CONFERENCE
1933—Conference held at Simla and New Delhi, India.
1934—New treaty signed at London, on July 12.

MANCHOUKUO ESTABLISHED,
1934—The New State was proclaimed "Empire" and Mr. Pu-yi endorsed as Emperor. March 1,

THE JAPAN-BRITAIN TRADE CONFERENCE
1934—Conference adjourned on March 14 in failure.

THE JAPAN-DUTCH CONFERENCE
1934—Conference opened at Batavia on June 8 which adjourned on December 21 indefinitely.

TRANSFERENCE OF NORTH MANCHURIA RAILWAY
1935—Transference of North Manchuria Railway by the U.S.S.R. to Manchoukuo formally signed at Tokyo on March 23.

JAPAN'S WITHDRAWAL FROM THE LEAGUE OF NATIONS
1935—Becomes completely effective on March 26.

THE VISIT OF THE EMPEROR OF MANCHOUKUO
1935—The Emperor of Manchoukuo visits Japan and makes a formal call upon the Emperor of Japan on April 6.

SETTLEMENT OF NORTH-CHINA INCIDENT
1935—All demands of the Japanese garrison at Tientsin on various problems occurred in North China accepted by the Nanking Government.

CHAPTER VII

NATIONAL DEFENCE

The Imperial Precepts to The Soldiers and Sailors

The forces of Our Empire are in all ages under the command of the Emperor. It is more than twenty-five centuries since the Emperor Jimmu, leading in person the soldiers of the Otomo and Mononobé clans, subjugated the unruly tribes of the land and ascended the Imperial Throne to rule over the whole country. During this period the military system has undergone frequent changes in accordance with those in the state of society. In ancient times the rule was that the Emperor should take personal command of the forces; and although the military authority was sometimes delegated to the Empress or to the Prince Imperial, it was scarcely ever entrusted to a subject. In the middle ages, when the civil and military institutions were framed after the Chinese model, the Six Guards were founded, the Right and Left Horse Bureaux established, and other organizations, such as that of the Coast Guards, created. The military system was thus completed, but, habituated to a prolonged state of peace, the Imperial Court gradually lost its administrative vigour; in course of time soldiers and farmers became distinct classes, and the early conscription system was replaced by an organization of volunteers, which finally produced the military class. The military power passed over entirely to the leaders of this class; through disturbances in the Empire the political power also fell into their hands; and for about seven centuries the military families held sway. Although these results followed from changes in the state of society and were beyond human control, they were deeply to be deplored, since they were contrary to the fundamental character of Our Empire and to the law of Our Imperial Ancestors. Later on, in the eras of Kokwa and Kaei, the decline of the Tokugawa Shogunate and the new aspect of foreign relations even threatened to impair our national dignity, causing no small anxiety to Our August Grandfather, the Emperor Ninko, and Our August Father, the Emperor Komei, a fact which We recall with awe and gratitude. When in youth We succeeded to the Imperial Throne, the Shogun returned into Our hands the administrative power, and all the feudal lords their fiefs; thus, in a few years, Our entire realm was unified and the ancient régime restored. Due as this was to the meritorious services of Our loyal officers and wise councillors, civil and military, and to the abiding influence of Our Ancestors' benevolence towards the people, yet it must also be attributed to Our subjects' true sense of loyalty and their conviction of the importance of "Great Righteousness." In consideration of these things, being desirous of reconstructing Our military system and of enhancing the glory of Our Empire, We have in the course of the last fifteen years established the present system of the Army and Navy. The supreme command of Our forces is in Our hands, and although We may entrust subordinate

Digitized by Google

commands to Our subjects, yet the ultimate authority We Ourself shall hold and never delegate to any subject. It is Our will that this principle be carefully handed down to posterity and that the Emperor always retain the supreme civil and military power, so that the disgrace of the middle and succeeding ages may never be repeated. Soldiers and Sailors, We are your supreme Commander-in-Chief. Our relations with you will be most intimate when We rely upon you as Our limbs and you look up to Us as your head. Whether We are able to guard the Empire, and so prove Ourself worthy of Heaven's blessings and repay the benevolence of Our Ancestors, depends upon the faithful discharge of your duties as soldiers and sailors. If the majesty and power of Our Empire be impaired, do you share with Us the sorrow; if the glory of Our arms shine resplendent, We will share with you the honour. If you all do your duty, and being one with Us in spirit do your utmost for the protection of the state, Our people will long enjoy the blessings of peace, and the might and dignity of our Empire will shine in the world. As We thus expect much of you, Soldiers and Sailors, We give you the following precepts :—

(1) The soldier and the sailor should consider loyalty their essential duty. Who that is born in this land can be wanting in the spirit of grateful service to it? No soldier or sailor, especially, can be considered efficient unless this spirit be strong within him. A soldier or a sailor in whom this spirit is not strong, however skilled in art or proficient in science, is a mere puppet; and a body of soldiers or sailors wanting in loyalty, however well ordered and disciplined it may be, is in an emergency no better than a rabble. Remember that, as the protection of the state and the maintenance of its power depend upon the strength of its arms, the growth or decline of this strength must affect the nation's destiny for good or for evil; therefore neither be led astray by current opinions nor meddle in politics, but with single heart fulfil your essential duty of loyalty, and bear in mind that duty is weightier than a mountain, while death is lighter than a feather. Never by failing in moral principle fall into disgrace and bring dishonour upon your name.

(2) The soldier and the sailor should be strict in observing propriety. Soldiers and sailors are organized in grades, from the Marshal and the Admiral of the Fleet down to the private soldier or ordinary seaman; and even within the same rank and grade there are differences in seniority of service according to which juniors should submit to their seniors. Inferiors should regard the orders of their superiors as issuing directly from Us. Always pay due respect not only to your superiors but also to your seniors, even though not serving under them. On the other hand, superiors should never treat their inferiors with contempt or arrogance. Except when official duty requires them to be strict and severe, superiors should treat their inferiors with consideration, making kindness their chief aim, so that all grades may unite in their service to the Emperor. If you, Soldiers and Sailors, neglect to observe propriety, treating your superiors with disrespect and your inferiors with harshness, and thus cause harmonious co-operation to be lost, you will not only be a blight upon the forces but also be unpardonable offenders against the state.

(3) The soldier and the sailor should esteem valour. Ever since the ancient times valour has in our

Digitized by Google

country been held in high esteem, and without it Our subjects would be unworthy of their name. How then may the soldier and the sailor, whose profession it is to confront the enemy in battle, forget even for one instant to be valiant? But there is true valour and false. To be incited by mere impetuosity to violent action cannot be called true valour. The soldier and the sailor should have sound discrimination of right and wrong, cultivate self-possession, and form their plans with deliberation. Never to despise an inferior enemy or fear a superior, but to do one's duty as soldier or sailor—this is true valour. Those who thus appreciate true valour should in their daily intercourse set gentleness first and aim to win the love and esteem of others. If you affect valour and act with violence, the world will in the end detest you and look upon you as wild beasts. Of this you should take heed.

(4) The soldier and the sailor should highly value faithfulness and righteousness. Faithfulness and righteousness are the ordinary duties of man, but the soldier and the sailor, in particular, cannot be without them and remain in the ranks even for a day. Faithfulness implies the keeping of one's word, and righteousness the fulfilment of one's duty. If then you wish to be faithful and righteous in any thing, you must carefully consider at the outset whether you can accomplish it or not. If you thoughtlessly agree to do something that is vague in its nature and bind yourself to unwise obligations, and then try to prove yourself faithful and righteous, you may find yourself in great straits from which there is no escape. In such cases your regrets will be of no avail. Hence you must first make sure whether the thing is righteous and reasonable or not. If you are convinced that you cannot possibly keep your word and maintain righteousness, you had better abandon your engagement at once. Ever since the ancient times there have been repeated instances of great men and heroes who, overwhelmed by misfortune, have perished and left a tarnished name to posterity, simply because in their effort to be faithful in small matters they failed to discern right and wrong with reference to fundamental principles, or because, losing sight of the true path of public duty, they kept faith in private relations. You should, then, take serious warning by these examples.

(5) The soldier and the sailor should make simplicity their aim. If you do not make simplicity your aim, you will become effeminate and frivolous and acquire fondness for luxurious and extravagant ways; you will finally grow selfish and sordid and sink to the last degree of baseness, so that neither loyalty nor valour will avail to save you from the contempt of the world. It is not too much to say that you will thus fall into a life-long misfortune. If such an evil once makes its appearance among soldiers and sailors, it will certainly spread like an epidemic, and martial spirit and morale will instantly decline. Although, being greatly concerned on this point, We lately issued the Disciplinary Regulations and warned you against this evil, nevertheless, being harassed with anxiety lest it should break out, We hereby reiterate Our warning. Never do you, Soldiers and Sailors, make light of this injunction.

These five articles should not be disregarded even for a moment by soldiers and sailors. Now for putting them into practice, the all important is sincerity. These five articles are the soul of Our soldiers

Digitized by Google

and sailors, and sincerity is the soul of these articles. If the heart be not sincere, words and deeds, however good, are all mere outward show and can avail nothing. If only the heart be sincere, anything can be accomplished. Moreover, these five articles are the Grand Way of Heaven and Earth and the universal law of humanity, easy to observe and to practise. If you, Soldiers and Sailors, in obedience to Our instruction, will observe and practise these principles and fulfil your duty of grateful service to the country, it will be a source of joy, not to Ourself alone, but to all people of Japan.

The 4th day of the 1st month of
the 15th Year of Meiji.
(Imperial Sign Manual)

General

Special Position of Army and Navy The Japanese Army and Navy are under the direct command of the Emperor and neither the Government nor the Diet has any right to interfere in the strategic actions or the number of men or ships to be maintained. In making any decision on military and naval strength or the organization thereof, the Emperor consults the Chiefs of the respective General Staffs, who are thereupon required to submit their plans direct to His Majesty. The plans are then handed to the Prime Minister, who in his turn consults the Diet as to the necessary appropriations. Thus the Diet, while powerless to interfere with the actual naval and military projects, is entitled to determine the amount to be appropriated for their execution. If, however, the Service estimates are reduced in such a way as to render the original projects impossible of execution, this is deemed to be an infringement of the Imperial Prerogative under Article XII of the Constitution.

The Board of Field Marshals and Fleet Admirals This Board was created in 1898 as the Emperor's highest advisory body on military and naval affairs. Its members are at present as follows :

Field Marshal H. I. H. Prince Kan-in; Field Marshal H. I. H. Prince Nashimoto; Fleet Admiral H. I. H. Prince Fushimi.

The High Military Council This is a larger advisory body which was created in 1887. Its membership includes, in addition to that of the above-mentioned Board, the Ministers of War and Marine, the Chiefs of the Naval and Military General Staffs and other generals and admirals specially nominated by the Emperor. Its functions are to advise the Emperor on all matters appertaining to war, especially on the correlation of the various departments of military administration, in the broader sense of the word. The Council may meet in sections to deliberate and tender advice on issues concerning the Army or Navy separately.

Present members specially nominated by the Emperor are :

Admiral	Kanji Kato
Admiral	Eisuké Yamamoto
General	Jotaro Watanabé
Admiral	Seizo Kobayashi
Admiral	Kichisaburo Nomura
General	Jinzaburo Masaki
General	Nobuyuki Abé
General	Sadao Araki
Admiral	Ryozo Nakamura
Admiral	Osami Nagano
General	Yoshiyuki Kawashima

Conscription The conscription system, first introduced in 1873 and last revised in 1927, demands that all able-bodied citizens of Japan proper between the ages 17 and 40 shall serve either in the army or the navy, when called upon. At present the natives of Taiwan, Chosen, and the South Sea Islands are

Digitized by Google

exempt from service. In fact, however, the general principle has never been applied, even during the Russo-Japanese War, the conflict having come to an end before the greater majority of those on the second reserve were called to the colours.

The service is divided as follows :-

(1) Jobi hei-eki (standing service). This is of two kinds: (a) Geneki (active service), 2 years for the army and 3 years for the navy; (b) Yobi-eki (1st reserve service), 5 years and 4 months for the army and 4 years for the navy.

(2) Kobi hei-eki (2nd reserve service), 10 years for the army and 5 years for the navy.

(3) Hoju hei-eki (replenishment reserve service). This is divided into two categories :—(a) 1st replenishment reserve service, 2 years and 4 months for the army and 1 year for the navy, (b) 2nd replenishment reserve service, 12 years and 4 months for the army and 11 years and 4 months for the navy.

(4) Kokumin hei-eki (national service), extending in principle for the necessary period in either arm for the man to reach the age of 40.

Men are subjected to medical examination for conscription at the age of 20, and are classed as follows :

Class I ; Class II, A, Class II, B ; Class III ; Class IV ; and Class V. They are then allocated to the various categories of service according to their medical class as follows :

Medical Class	Description	Service to which Allocated
I, II, A and B	Fit for active service.	Active service or replenishment reserve.
III	Fit for national service, but not for active service.	National service
IV	Unfit for any service.	Exempt from all service.
V	Nature of fitness undecided (may be included in Class I or Class II, A or B, in the following year).	Allocation postponed

They are then drafted to different branches of service according to the districts to which they belong and their ability and occupation.

Those who are fit for active service (Class I, Class II, A and B) are enrolled by lottery, at each conscription district, for active service or 1st or 2nd replenishment reserve. (Volunteer enrolments for active service are accepted.) Those having finished the period of active service are placed on the 1st reserve list for terms as stated above. At the end of such terms they are removed to the 2nd reserve, and then finally to the national service. Those who have gone through the period of replenishment reserve service are also transferred to the national service.

Sole supporters of families, and criminals sentenced to over 6 years' imprisonment or penal servitude are also exempt from service. Those studying at certain schools, Government or private, which are recognized to be of equivalent or superior status to that of middle schools are exempt from conscription examination until the completion of their studies or until they attain their 27th year. Those staying abroad enjoy postponement of service under similar conditions, the age limit being 37.

By virtue of a revision of the conscription law in 1927, the active service of conscripts who have finished the course of a Seinen Kunrenjo (Young Men's Training Institute) is reduced by six months, while

Digitized by Google

that of the graduates from normal schools by nineteen months. In other words, the former have to serve only eighteen months and the latter only five months, instead of full two years. A similar system of short term active service has also been adopted by the Navy.

The term of active service for graduates of middle schools and higher grade schools who have received full disciplinary training while at school and passed the final examination thereof is reduced to 12 months.

The conscription examination of such students is postponed till they reach the age of full 27 years.

After 3 months' active service they may be chosen as cadets and get special training for the remaining 9 months. They may be promoted, according to abilitity, to either corporals or second lieutenants in the first reserve service at or after the expiration of active service. From among the graduates of technical or scientific demartments of universities cadets may be chosen to supply technical officers of artillery, engineer and air forces.

Examination for Conscription According to medical examination, conscripts are classified into six grades as mentioned above. The figures for the past six years, 1928-1934, were as follows :

	Total Number Examined	Class I	Class II A	Class II B	Class III	Class IV	Class V
1928	568,796	171,744	64,970	119,783	171,758	39,861	680
1929	585,819	175,979	69,372	119,721	178,790	41,075	882
1930	595,505	174,482	69,275	121,961	187,863	40,989	938
1931	619,146	178,355	72,617	124,942	200,268	42,245	724
1932	621,844	174,282	71,556	125,938	207,401	41,951	716
1933	631,099	178,994	72,796	132,681	205,777	40,141	710
1934	641,969	185,482	72,979	135,275	206,810	40,822	651

Statistics on height and weight ascertained through the medical examinations for recent 7 years, 1928-1934, are as follows :

	Average Height	Average Weight
1928	1.596 m.	52.639 kg.
1929	1.602 m.	52.823 kg.
1930	1.598 m.	52.727 kg.
1931	1.600 m.	53.007 kg.
1932	1.600 m.	52.841 kg.
1933	1.602 m.	52.816 kg.
1934	1.603 m.	52.994 kg.

The grades of education attained by men examined for conscription in recent 7 years, 1928-1934, were :

	University	Higher School	Middle School	Higher Elementary School	Elementary School	Elementary School (Unfinished)	Uneducated
1928	81	1,209	43,309	266,611	209,413	42,200	5,973
1929	143	3,589	50,684	284,081	205,862	36,408	5,553
1930	493	7,303	65,944	296,829	197,312	31,812	4,812
1931	1,721	11,406	65,698	313,628	192,772	28,913	5,009
1932	3,741	13,188	69,147	324,204	182,064	25,323	4,177
1933	6,616	15,049	70,422	339,677	174,024	21,634	3,677
1934	9,031	16,467	72,622	356,135	165,240	18,802	3,672

Of those listed above as uneducated 3,463 for 1928, 3,045 for 1929, 2,873 for 1930, 3,090 for 1931, 2,543 for 1932, 2,268 for 1933 and 2,433 for 1934 were illiterates. The ratio of illiteracy, which was 4.28 per cent. in 1903, 3.44 in 1911 and 2.17 in 1915, has been decreasing steadily, being 0.88 in 1925, 0.70 in 1927, 0.61 in 1928 and 0.38 in 1934.

Digitized by Google

Conscripts and Leave of Absence Conscripts may return home to attend to family business for periods varying with the necessity of the case, but in no case exceeding 14 days. This departure from the general rule was proposed in 1919 to meet the convenience of the families of conscripts and was carried into effect at once.

Courts-Martial The Court-Martial Law provides that (1) all offences committed by officers and men shall be given public trial, (2) accused persons shall be given the benefit of counsel in their defence. Provision is also made for appeal.

The Army has eight courts-martial, namely, the High, the Divisional and six other temporary ones; the Navy has seven, the High, the Tokyo, the Admiralty and four other temporary ones. Courts-martial are always composed of judges (military or naval officers), law officials (civil) and clerks. The number of these varies in accordance with the nature of the court in question.

Gendarmerie The gendarmerie is under the control of the War Minister and mainly takes charge of military police, although it may assist civil or judicial police. Orders may, therefore, come from Ministers of Home Affairs and Justice. As military police its function is to see military laws and order kept. Guarding of military secrets, policing of fortress districts and naval stations, enforcement of laws concerning conscription, active service, calling out of the reserve, enforcing levy and martial laws, general surveillance of military discipline, and keeping order in war districts; there things come under its administrative responsibility. The searching and detection of crimes among military men, the collection of evidences and the arrest of culprits come under its judicial responsibility. The number of gendarmes is: Japan proper 1,450, Korea 490, Manchuria 190, and Formosa 90.

Improvement in 1933

Conscription Districts The number of country districts divided for the purpose of conscription was lessened from 677 to 431. This was made so as to enlarge the area of each district and thus eliminate the chance of missing good material available. As to the re-arrangement of the city districts studies are being carried on.

School Graduate Cadets Graduates from middle schools and colleges are accorded special treatment of a short-term active service as stated above. The improvements effected by the Imperial Ordinance No. 71, April, 1933, on this point are as follows: (1) The abolition of the special fee, (2) the abolition of special treatment which they used to receive and the substitution for it by the system under which they are taken as usual soldiers first and, after three months, are chosen cadets according to their records, (3) the abolition of distinction of treatment given with graduates of middle schools and those of colleges, by which 12 months' service for the former and 10 months' for the latter was mergered into a uniform 12 months' service, and (4) choice of cadets for engineering and technical service from graduates of scientific and technical colleges.

Juvenile Flying Students By the revision of Flying School rules juveniles are allowed to enter the Tokorozawa Flying School. Applicants for the pilotting course must be boys of 17 to 19 of age, while boys from 15 to 19 are admitted to the engineering course.

Flying School One more flying school was established at Hamamatsu, Shizuoka prefecture, its spe-

Digitized by Google

cialities being studies in explosives, bombs, bombing, etc.

Juvenile Students of Communications Boys 15 to 18 are admitted into the Army Signallers' School to become non-commissioned engineering officers for wireless communications. The course of studies extend over 2 years.

Narashino Military School As an item of scientific improvement programme of the Army, the Narashino Military School was opened on August 1, 1933, at Narashino, Chiba prefecture. The underlying purposes are the studies of and education in military science related to modern fighting. Students are taken from all officers except those of the gendarmerie.

Volunteer Active Service A new system of taking reserve officers into active service as volunteers was instituted in February, 1933. The term of service extends over 2 years, renewable every year on expiration, until the volunteers reach the age of 40 (42 in the case of university graduates and 45 in engineers). The volunteers must be first and second lieutenants or ranking officers under 30 (32 in the case of university graduates and 35 in engineers). The number taken in 1933 was 890.

The Army

Outline History The Army under the Imperial régime was organized for the first time in the fourth year of Meiji (1871), when the samurai of the Kagoshima, Kochi and Yamaguchi clans formed an Imperial Bodyguard consisting of a few battalions, and four regular army divisions were established in Tokyo, Osaka, Kumamoto and Sendai. In January, 1873, the Government adopted a conscription system, by which members of all social classes were held equally liable for military service. The divisions in Nagoya and Hiroshima, which were established that year, were the first fighting units in this country to contain members of the farmer, merchant and other non-samurai classes. The total strength of the Japanese Army at that time was seven divisions consisting of about 36,600 men on peace standing and 46,250 on a war footing.

The number of soldiers to be mobilized was steadily increased after the Saigo Rebellion of 1877, but it was with this "cadre" of seven divisions that Japan defeated China in 1894-5. In the ten years following the Japan-China War, six more divisions were established with the result that Japan was able to put nearly one million men in the field during the Russo-Japanese War of 1904-5.

In 1922 Japan's Army strength reached twenty-one divisions consisting of 308,000 men on peace standing. The peaceful atmosphere in world affairs after the European War and the national financial condition made it necessary for Japan to reduce the army, and as the result of a readjustment effected between 1922 and 1924, a reduction of 1,800 officers, 56,000 men and 13,000 horses was made. This corresponds to a reduction of about five divisions on peace standing. In May, 1925, four more divisions (the 13th, 15th, 17th and 18th) were abolished, and the present strength of the Japanese Army is 17 divisions and about 230,000 men on peace standing, inclusive of the Taiwan and Kwantung Armies.

Army Expenditures

The Army expenditures from 1893-94 down to 1934-35 have been as follows:

Digitized by Google

Year	Running Expenses	Extraordinary Expenses	Total
1893-94	¥ 12,420,000	¥ 2,801,000	¥ 14,721,000
(Just before Sino-Japanese War)			
1896-97	32,614,000	20,629,000	53,243,000
1903-04	39,353,000	7,529,000	46,884,000
(Just before Russo-Japanese War)			
1906-07	37,835,000	30,045,000	67,870,000
(Just after Russo-Japanese War)			
1912-13	80,175,000	23,950,000	104,125,000
1917-18	88,344,000	35,093,000	123,437,000
1923-24	176,224,000	47,704,000	223,927,000
1924-25	179,331,000	27,403,000	206,734,000
1925-26	170,761,000	44,044,000	214,805,000
1926-27	167,561,000	29,380,000	199,941,000
1927-28	174,190,000	43,913,000	218,104,000
1928-29	167,620,000	81,486,000	249,106,000
1929-30	178,898,000	48,356,000	227,255,000
1930-31	174,546,000	26,278,000	200,824,000
1931-32	163,679,000	63,808,000	227,488,000
1932-33	148,266,000	225,309,000	373,575,000
1933-34	166,471,000	296,173,000	462,644,000
1934-35 (Budget)	169,038,000	284,656,000	453,695,000
1935-36 („)	179,803,000	313,155,000	492,958,000

Army Budget for 1935-1936

The army budget for 1935-1936 reaches ¥492,958,079, exceeding by ¥39,263,000 over that of the previous year. The special demands were ¥116,196,000 for new armaments, the expenses for maintaining troops in Manchuria, etc., the demand for the latter being about ¥26,000,000 more than that of the previous year. Among special items of the expenditure there are ¥16,176,779 for the improvement of Air Corps, ¥2,058,360 for rewards, ¥5,084,000 for the improvement of arms, and ¥2,064,000 for the reconstruction of equipments damaged by natural disasters. (See Chapter VIII, A General Survey of the Budget, 1935-36.) Details follow:

Administrative Organization

Administration of the Army is conducted by the following three organs, the chiefs thereof working under direct order from the Throne:

The Ministry of War The central organ for military administration. The Ministry contains eight departments, the names and functions of which are listed below:

(a) The Minister's secretariat takes charge of all secret affairs, papers and other records, and general office work.

(b) The Bureau of Personal Affairs is in charge of all the affairs concerning the personnel of the army. It consists of two sections, the one dealing with appointments, promotion, etc., the other of decorations.

(c) The Bureau of Military Affairs is the real centre of military administration, and is responsible for the establishment of the system and organization of the Army, for the proclamation and withdrawal of martial law, and for all the affairs concerning ceremonies to be observed by the soldiers, morals and discipline among the men, the drafting of men and horses to various units, the conscription system, etc., etc.

(d) The Replenishment Bureau is divided into two sections, one for mobilization and the other for co-ordination, and is responsible for the establishment and improvement of the mobilization system, preparation and co-ordination of war supplies, improvement of military transportation, etc.

(e) The Arms and Ordnance Bureau consists of the section for rifles and guns and the section for various supplies. It is in the charge of arms, ordnance, and various supplies of war.

(f) The Intendance Bureau has four sections, the Paymaster's, Audit, Clothing and Provisions, and Construction. This bureau is responsible for expenditure, the inspection of accounts, preparation of budgets, provisions, clothing, structures, etc.

(g) The Medical Bureau is responsible for all sanitary and medical arrangements among officers and men. It consists of the section for sanitary affairs and the section for medicine and surgery.

(h) The Judicial Bureau is responsible for the organization of courts-martial and all other affairs in connection with martial law.

The Ministry of War also supervises the following organizations situated in various parts of the country.

(a) The Military Aviation Bureau is the central organ for the study of military aviation, and is required to organize the education of pilots and mechanics, to supervise repairs, replenishment, and purchases of aeronautical supplies, etc.

(b) The Technical Investigation Bureau conducts researches on all technical developments likely to effect military efficiency. Inspection of ordnance and various war supplies is conducted by this bureau. Under its supervision is the Laboratory of

Digitized by Google

Military Science which conducts research on methods of scientific warfare.

(c) The Military Technical Board. This is an organ for deliberation on all technical problems submitted by the War Minister.

(d) The Military Arsenal is responsible for the establishment of designs and plans of arms and ordnance, as well as repairs and examination of various supplies of war inclusive of gunpowder. It has branches in Osaka, Nagoya, Oji, Kokura and Heijo.

(e) The Woolen Factory at Senju is engaged in the manufacture of woollen yarn and clothes, for military supplies.

(f) The Remount Bureau has charge of horse replenishment, including breeding and purchase.

(g) The Military Arms Depot is responsible for the purchase, storage, repairs, maintenance, supply, exchange, and scrapping of arms and ordnance. It also takes care of the guns installed in fortresses. The main office is in Tokyo and there are branches in Chiba, Osaka, Nagoya, Kokura, and Hiroshima.

(h) The Military Clothing Depot has its head office in Tokyo, and branches in Osaka and Hiroshima. It takes care of the manufacture, purchase, storage, and supply of all clothing supplies.

(i) The Military Hygienic Supplies Depot is responsible for the manufacture, purchase, storage, supply, and inspection of all hygienic supplies.

(j) The Military Depot of Provisions and Forage, with its head office in Tokyo and branches in Osaka and Ujina, is in charge of the preparation and supply of provisions and forage.

(k) The Fortifications Bureau is responsible for the construction, inspection, and maintenance of all defensive structures, besides being required to conduct researches on artillery and military engineering.

(l) The Military Transport Bureau is situated at Ujina and looks after all matters concerning the transportation of troops.

The General Staff It deliberates on national defence and strategy. It is also required to train and supervise all staff officers. The Staff College and the Land Survey Bureau are under the control of the Chief of the General Staff.

The Land Survey Bureau is responsible for the replenishment of military maps, production of maps for public use and the training of experts for the Bureau services.

The Department of Military Training It is in charge of all military schools and the training and education of officers and men, as well as the co-ordination and development of military education; aeronautical education of military aviation, however, is entrusted to the Aviation Bureau, and the training of staff officers comes under the General Staff.

The Department consists of the headquarters and sections for cavalry, artillery, engineers and commissariat.

Field Organization

The Division A division generally consists of 2 infantry brigades, 1 cavalry regiment, 1 field artillery regiment, 1 engineer battalion, and 1 commissariat battalion. To some larger divisions, a tank corps, or a mountain artillery regiment, or a heavy field artillery regiment, is attached. While a few others include a full cavalry brigade, a regiment of transport service, a regiment of telegraphists or an anti-aircraft regiment. Eight ammunition columns (4 infantry and 4 artillery), 6 field hospitals, and 1 remount depot accompany each division on service. The

Digitized by Google

number of officers and men in a division is about 10,000 on peace standing. Divisional commanders hold the rank of Lieutenant-General, brigade commanders that of Major-General.

The Regiment An infantry regiment consists of 3 battalions and a machine-gun corps, and an infantry battalion of 3 companies of 150 men each, and a machine gun section. A company is subdivided into three sections.

A cavalry regiment, of which Japan has 25 at present, consists of 2 or 3 squadrons. Eight of these regiments are organized into four independent cavalry brigades, while the remaining seventeen are attached one to each of the divisions.

Japan has 30 artillery regiments and 10 battalions, namely 15 regiments of field artillery, 1 battalion of horse artillery, 4 regiments and 1 battalion of mountain artillery, and 8 regiments of heavy field artillery. A field artillery regiment is divided into 3 battalions, and a battalion into 3 companies. On peace strength a field artillery regiment consists of only 6 batteries each equipped with four guns. In addition there are 3 regiments and 8 battalions of heavy artillery, which are responsible for the defence of fortified zones.

In peace time 1 regiment and 1 battery of anti-aircraft artillery are maintained.

Air Force Japan's air force is divided into units attached to the Army and Navy respectively. The Army air force consists at present of 11 reconnoitering squadrons, 11 fighting squadrons, 4 bombing companies, and 2 balloon companies, consisting of approximately 1,000 planes.

The Peace Strength

A full statistical classification of the peace strength of the Army, with the total number of soldiers nearly 230,000, in 1935, is given below. In addition to the units listed, a force of gendarmerie 2,220 strong and a medical corps, about 1,500 strong are maintained.

Units	No. of Complete Regiments	No. of Additional Battalions
Infantry	70	6
Cavalry	25	
Field Artillery	15	
Mountain Artillery	4	1
Horse Artillery		1
Heavy Field Artillery	8	
Heavy Artillery	3	8 (independent)
Engineers		17
Railway Corps	2	
Telegraph Corps	2	
Air Force	8	
		(corps)
Balloon Corps		1
Commissariat		15
Tank Corps		2
		(corps)
Anti-Aircraft Artillery	1	1

This force is divided into 17 divisions and 34 brigades and was stationed in December, 1933 as follows :

The 3rd Battalion of the regiment is stationed at Taiden.	
Cavalry Regiment 28th	Ryuzan
Field Artillery Regiment 26th	Ryuzan
Anti-aircraft Corps of above regiment	Heijo
Heavy Artillery Battalion of Masan	Masan
Engineer Battalion 20th	Ryuzan
Air Force Regiment 6th	Heijo

The Headquarters of special units are distributed as follows :

Tokyo Garrison Headquarters	Tokyo
Headquarters of Chosen Army	Keijo
Headquarters of Taiwan Army	Taihoku
Headquarters of Taiwan Garrison	Taihoku
1st Taiwan Infantry Regiment 1	Taihoku
2nd Taiwan Infantry Regiment 2	Taihoku
Taiwan Mountain Artillery Battalion	Taihoku
Kiirun Heavy Artillery Battalion	Kiirun
Mako Heavy Artillery Battalion	Mako
Heito 8th Flight Regiment	Heito
Headquarters of Kwantung Army	Ryojun
Headquarters of Independent Garrison	Koshurei
1st Infantry Battalion Independent Garrison	Koshurei
2nd Infantry Battalion Independent Garrison	Mukden
3rd Infantry Battalion Independent Garrison	Tashihchiao
4th Infantry Battalion Independent Garrison	Lienshankwan
5th Infantry Battalion Independent Garrison	Ssupinkai
6th Infantry Battalion Independent Garrison	Antung
Ryojun Heavy Artillery Battalion	Ryojun
Headquarters of Japanese Force in China	Tientsin
Japanese Infantry Garrison in Tientsin	Tientsin
Japanese Infantry Garrison in Peiping	Peiping

Fortresses

The Army has 17 fortresses at places of strategic importance in different parts of Japan proper and its dependencies. At each of these fortresses, a heavy artillery regiment or battalion is stationed, and in some cases an air force detachment. Their sites and divisional attachments are as follows :

	Site	Division
(1)	Yokosuka	1st
(2)	Chichijima (Bonin Is.)	,,
(3)	Yura	4th
(4)	Amamioshima	6th
(5)	Hoyo	,,

OCCUPATION OF SENIOR COMMANDS

(August 1, 1935)

Name and Rank	Command
Lieut.-General Giichi Nishi	Tokyo Garrison
Lieut.-General Prince Asaka	Guard Division
Lieut.-General Heisuké Yanagawa	1st Division
Lieut.-General Yoshijiro Umezu	2nd Division
Lieut.-General Tsuneichi Iwakoshi	3rd Division
Lieut.-General Prince Higashikuni	4th Division
Lieut.-General Kuniaki Koiso	5th Division
Lieut.-General Kohei Kashii	6th Division
Lieut.-General Okiiyé Usami	7th Division
Lieut.-General Kotaro Nukamura	8th Division
Lieut.-General Toyozo Toyama	9th Division
Lieut.-General Yoshitsugu Tatekawa	10th Division
Lieut.-General Motoo Furusho	11th Division
Lieut.-General Kiyoshi Kazuki	12th Division
Lieut.-General Shunroku Hata	14th Division
Lieut.-General Inohiko Shibuya	16th Division
Lieut.-General Yoshiyuki Suzuki	19th Division
Lieut.-General Mitsuharu Miyaké	20th Division

OVERSEAS COMMANDS

Name and Rank	Command
General Jiro Minami	Kwantung Army
Lieut.-General Hisaichi Ueda	Chosen Army
Lieut.-General Count Hisaichi Terauchi	Taiwan Army
Major-General Hayao Tada	Japanese Garrison in China

Promotion and Age Limit

Army officers in service are promoted to higher ranks by selection in accordance with the following rules in time of peace, the time limit being reduced by one-half in war time:

One year from Sub-Lieutenant to Lieutenant, 2 years from Lieutenant to Captain, 4 years to Major, 2 years to Lieutenant-Colonel, 2 years to Colonel, 2 years to Major-General, 3 years to Lieutenant-General. Promotion to full General and then to Marshal is subject only to the Emperor's will.

The age limit for officers on the active list varies according to rank as follows:

General	65
Lieutenant-General	62
Major-General	58
Colonel	55
Lieutenant-Colonel	53
Major	50
Captain	48
Lieutenant and Sub-Lieutenant	45

There is no age limit for Marshals.

Army Education

Schools providing instruction in military affairs are of three categories as follows:

(1) Those under the authority of the Department of Military Education, of which a full list is given below:

Digitized by Google

Name	Place
Artillery and Engineering School	Tokyo
Infantry School	Chiba prefecture
Cavalry School	„ „
Field Artillery School	„ „
Heavy Field Artillery School	Kanagawa prefecture
Engineers' School	Chiba „
Signallers' School	Tokyo „
Mechanical Transport School	„ „
Narashino Military School	Chiba „
Toyama School	Tokyo city
Military Academy	„ „
Military Preparatory School	„ „
4 Non-Commissioned Officers' Schools	Tokyo, Sendai, Toyohashi, Kumamoto

Toyama School teaches fencing, gymnastics and military music to both officers and men.

(2) The Staff College (Tokyo City) under the direct control of the General Staff.

(3) Those under the control of various bureaux of the Ministry of War, of which a full list is given below.

Name	Place
Tokorozawa Flying School	Saitama prefecture
Akeno Flying School	Miyé „
Hamamatsu Flying School	Shizuoka „
Shimoshizu Flying School	Chiba „
Engineering School	Tokyo City
Intendance School	„ „
Army Medical School	Tokyo City
Army Veterinary School	„ „
Gendarmerie Training School	„ „

The Flying School at Tokorozawa is to give necessary training to military fliers as to how to handle and repair a plane and its engine, and meteorological observation, besides a knowledge of the materials of which planes and engines are constructed. This school is opened to civilian students. The Flying School at Shimoshizu is to teach aerial photography, aerial communications and reconnoitering. The Akeno Flying School gives courses to army pilots on the aerial tactics, air navigation, handling of machine-guns on a plane and also on the construction of aerial weapons.

To raise the level of educational capacity and general efficiency among officers, certain special courses and facilities are arranged. Graduates from universities in science or engineering are now entitled to the position of engineer of artillery lieutenants after six months' cadetship, while those from the medical and agricultural colleges are qualified to become surgeon and veterinary lieutenants respectively after three months' cadetship. Non-commissioned officers of ability may be promoted to the rank of lieutenant in virtue of a system adopted in 1930, after a short period of special training. Posts still higher, even to the supreme Marshalship, are open to non-commissioned officers of exceptional ability.

The Navy

Outline History As a result of the policy of seclusion strictly followed by the Shogunate Government of the Tokugawas, Japan was without anything worthy of the name of a navy, when Commodore Perry's fleet entered Uraga Bay in the 6th year of Kaei (1853) with a view to inducing the Shogun's Government to open Japanese ports to the world. By the 4th year of Ansei (1857), however, Japan was in possession of a few warships given her by Holland and England. They formed the first squadron of the Western type that the nation ever had. By the efforts of the Meiji Government, this squadron developed into an efficient fleet of 28 fighting craft and 24 torpedo-boats, with a total tonnage of over 50,000 tons by 1894, when Japan declared war on China. After the Sino-Japanese War, Japan's navy grew very rapidly and in 1902, just before the outbreak of Russo-Japanese War, was in possession of 78 ships with a total tonnage of 256,816 tons.

The Naval Policy Japan's naval policy was, and is, to maintain a fleet powerful enough to defend the country against any naval force which could be dispatched to the western Pacific by any naval Power of the world. This policy was embodied first in the expansion plan adopted in 1907, including the construction of 8 battleships, 8 battle-cruisers, 21 light cruisers, 64 destroyers, and 32 submarines. As a preliminary to carrying out the plan, it was decided to build 8 battleships, 4 battle-cruisers, 11 light cruisers and a number of destroyers and submarines at a total expenditure of ¥254,000,000. In 1916, the Diet passed the programme to be carried out in the seven years ending 1923. In 1917, the programme was enlarged by a project covering the construction of 2 more battle-cruisers and a number of auxiliary ships in the six years ending 1923. In 1919, this programme was enlarged by a new project covering the construction of 8 capital ships and 85 auxiliary ships at a total expenditure of ¥750,000,000 to be appropriated in the eight years ending 1927. Thus, in 1921, Japan's naval expenditure amounted to about ¥500,000,000 or about one-third of the total amount of the budget.

The 1919 Programme The number and kind of ships to be constructed by the 1919 plan were 8 battleships armed with 16-inch guns (Nagato, Mutsu, Tosa, Kaga, etc.) and 8 battle-cruisers (Amagi, Akagi, etc., etc.), 26 light cruisers, 94 destroyers, and 93 submarines. As a result of the Washington Conference, the construction of these ships was abandoned, the Mutsu and the Nagato being retained on the list, while the Akagi and the Amagi were retained for conversion into plane carriers. (The great earthquake of 1923 made the Amagi unfit for service, and she was replaced by the Kaga).

After the Conference every effort was made to build up a powerful fleet of auxiliary ships to compensate for the deficiency in capital ships, of which Japan was allowed only 9 as against the 15 each of America and Britain. This effort resulted in the establishment of a well balanced fleet of auxiliary ships. The Naval Treaty signed in London in 1930, however, again gave Japan a low ratio in the number and tonnage of eight-inch gun cruisers, and allowed her only 52,700 tons of submarines, in spite of her demand for

Digitized by Google

a minimum of 78,000 tons. This made it necessary further to reinforce the auxiliary fleet.

The 1931 Plan In 1931, the First Naval Replenishment Plan was referred to the Diet which passed it almost unanimously. The plan covers the construction of 4 light cruisers of 8,500 tons each, 12 first class destroyers of 1,400 tons each, 9 first class submarines, 1 large mine-layer, 3 smaller mine-layers, 4 torpedo-boats, and 6 mine-sweepers, at a total expenditure of ¥247,080,000 to be appropriated in the 6 years.

The 1932 Plan The replenishment plan is accompanied by two other plans, the first of which covers the establishment of 12 naval flying corps on land and an aeronautic arsenal, the improvement and reinforcement of planes carried on plane-carriers and other ships, and the improvement of arms to be mounted on naval planes. The total expenditure for this, amounting to ¥81,970,000, is to be voted by 1936. On its completion, the plan is to be followed by another expansion plan covering the establishment of 2 more flying corps on land at a total expenditure of ¥50,000,000. The second plan supplementary to the 1931 Replenishment Plan covers a total expenditure of ¥44,950,000 to be appropriated for the modernization of capital and auxiliary ships, plane-carriers, submarines, and the replacement of guns, etc. When these replenishment programmes are completed, Japan will have 12 Treaty cruisers, 23 light cruisers, 4 plane-carriers, 4 submarine tenders, 6 mine-layers, 8 coast defence ships, 13 gun-boats, 79 first class destroyers, 34 second class destroyers, 33 first class submarines, 38 second class submarines, 4 torpedo-boats, 14 mine-sweepers, 3 training-ships, 1 target ship, 2 surveying ships, 17 transports, and 1 ice-breaker.

The naval authorities referred a second naval replenishment plan to the Ministry of Finance for study on October 31, 1932. The plan calls for a total expenditure of ¥460,000,000 covering the construction of one plane-carrier of 8,000 tons, two 8,500 ton cruisers with 6-inch guns, 14 first class destroyers of 1,400 tons each, six submarines, one mine-layer of 5,000 tons type, a number of torpedo-boats and mine-sweepers, and the establishment of 8 flying corps on land, all for completion in the 4 years ending 1936.

The Disarmament Question

The claim of the Powers as to naval limitation came to be known at the preliminary disarmament conference held at London in 1934. The contention of Japan at the conference was that in order to establish the principle of non-menace and non-aggression, the differential ratios which now exist between the great naval Powers should be withdrawn, and in their place a common maximum limit for the navy to be maintained by those Powers should be fixed; and that, in order to effect real disarmament, that maximum limit must be reduced to the lowest point possible. She contended further that navies which can be used for any offensive purpose must entirely be done away with, or, failing that, reduced to the minimum, and only navies which could be operated for defensive purposes should be provided. While it is important for the Powers to reserve the right to maintain a navy, the strength of which is equal to that of other Powers, still the importance of fixing a maximum limit must not be overlooked. Unless a maximum limit be fixed, construction competition will result among the Powers.

Digitized by Google

This is against the principle of disarmament and becomes a menace to peace.

Next, the reason why Japan holds that a common maximum limit should be fixed and that she should maintain a naval force equal to that of other Powers was in the change of conditions as enumerated below:

(1) The progress and development made recently in battleships, aeroplanes, etc. have made it extremely difficult to effectuate defence operations.

(2) The remarkable increases in the air forces of the U.S.S.R. and China, and the revival of the Far Eastern naval forces of the former.

(3) The establishment of the naval port of Singapore by Great Britain, and the extension and strengthening of the naval port of Hawaii by the U.S.A. have had a great effect on the naval plan of operations in Far Eastern waters.

(4) The birth of Manchoukuo has brought forth vast changes in Far Eastern politics. It has increased the responsibility of the Japanese Empire as the stabilizing power in the Far East.

The contention of Great Britain and the U.S.A. against the claims of Japan was that the present differential ratios should be maintained. The reason for this was that, although acquiescence in Japan's claim for parity would not threaten the security of their national defence, allowing Japan to possess a naval force of equal strength would permit her to act as she pleases in the Far East. There are two points which are worthy of notice in this contention. One is that the security of Britain's and the United States' national defence can be established on the basis of the Japanese proposal and the other is that in spite of that fact they are not willing to consent to it, because of the fear that Japan may act independently in the Far East. In other words, the idea of naval armaments entertained by these two countries seems to be that the armaments must not stop short at maintaining peace and order in their respective country, but go beyond that and make the problems of another country, which have no connections with their own national defence, as a basis for an agreement on the disarmament question. This goes counter to the Japanese contention that a country's defence measures should start and end at securing its own peace and the conference adjourned without arriving at a definite result.

Naval Expenditures

The naval expenditure from 1893-94 down to 1934-35 have been as follows:

Year		Running Expenses	Extraordinary Expenses	Total
1893-94	(Just before Sino-Japanese War)	¥ 5,141,000	¥ 2,960,000	¥ 8,101,000
1896-97	(Just after Sino-Japanese War)	7,351,000	12,655,000	20,006,000
1903-04	(Just before Russo-Japanese War)	21,530,000	14,588,000	36,118,000
1906-07	(Just after Russo-Japanese War)	27,991,000	33,885,000	61,876,000
1912-13		41,534,000	53,952,000	95,486,000
1917-18		48,528,000	113,906,000	162,434,000
1925-26		122,242,000	106,761,000	229,003,000
1926-27		127,428,000	109,879,000	237,307,000
1927-28		136,545,000	136,992,000	273,537,000
1928-29		143,026,000	125,106,000	268,132,000
1929-30		147,648,000	120,016,000	267,664,000

Ordinary expenditures	¥215,917,880
Extraordinary expenditures	313,765,604
Total	529,683,434

Administrative Organization

Warships and other vessels organized into fleet and squadrons actually represent what is called the Japanese Navy, and all the organs under the jurisdiction of the Ministry of Marine are intended for the construction, maintenance, control and successful utilization of these vessels. Each naval station and fleet is placed in the charge of a Commander-in-chief, who is responsible for the discipline and education of his men.

The Minister The Minister of Marine is in charge of the administration of the Navy, while the Chief of the Naval Staff is directly responsible to the Emperor for operation, mobilization and intelligence. The administrative departments under the supervision of the Minister of Marine are the following :

Digitized by Google

(1) Ministerial Secretariat
(2) Bureau of Military Affairs
(3) Personnel Bureau
(4) Education Bureau
(5) Bureau of Stores
(6) Medical Bureau
(7) Bureau of Accounts and Supplies
(8) Bureau of Civil Engineering
(9) Bureau of Judicial Affairs
(10) Library
(11) Telegraphy Division

The schools under the supervision of the Minister are:

(1) Naval War College (Tokyo). This school is intended for the training of advanced students selected from among naval officers.

(2) Naval College (Etajima). This school is intended for the education of intending naval officers. Warrant officers are also educated here before they are promoted to the rank of special service officer.

(3) Naval Engineering College (Maizuru). This school is intended for the education of intending engineering officers. Warrant engineering officers are received under the same conditions as at the Naval College.

(4) Naval Medical College. This school is to train surgeons and pharmacists and to conduct research in the field of surgery, medicine and naval sanitation. Warrant Wardmasters are educated here before they are qualified for the rank of Wardmaster Lieutenant.

(5) Naval Paymasters' College. This school is intended for the education of intending naval paymasters. Warrant Writers are educated here before they are qualified for the rank of Accountant Lieutenants.

Under the Commander-in-Chief The following schools are under the direct supervision of the Commanders-in-Chief of the Naval Stations.

(1) Naval Gunnery School (Yokosuka). Officers, special service officers, warrant officers and seamen of special ratings are admitted.

(2) Torpedo School (Yokosuka). Officers, warrant officers and seamen specially selected are admitted.

(3) Naval Communications School (Yokosuka). Officers, warrant officers and seamen specially selected are admitted.

(4) Navigation School (Yokosuka). Officers, warrant officers and seamen specially selected are admitted.

(5) Submarine School (Kuré). Officers, warrant officers and seamen specially selected are trained here for submarine warfare. Researches on submarine construction and operation are also conducted.

(6) Naval Mechanists' School (Yokosuka). This school is for the training of warrant officers and seamen aspiring to the rank of engineering officer, ar special service engineering officer, or shipwright.

Active Service Organization

The Three Districts The coasts of Japan and the seas surrounding the country are divided into three Naval Districts, and these districts are placed in the charge of naval stations as follows:

1st Naval District, consisting of the coasts of Aomori, Iwaté, Miyagi, Fukushima, Ibaraki, Chiba, Tokyo, Kanagawa, Shidzuoka, Aichi, Miyé, Hokkaido and Karafuto, and the adjacent seas, is in the charge of the Yokosuka Naval Station.

2nd Naval District, consisting of the coasts of Wakayama, Osaka, Hyogo, Okayama, Hiroshima, Yamaguchi, Shimané, Tottori, Kyoto, Fukui, Ishikawa, Toyama, Niigata, Yamagata, Akita, Tokushima, Kochi, Ehimé, Kagawa, Oita, Miyazaki, and the eastern part of Fukuoka prefecture, and the adjacent seas, is in the charge of the Kuré Naval Station.

Digitized by Google

3rd Naval District, consisting of the coasts of the remainder of Fukuoka prefecture, Saga, Nagasaki, Kumamoto, Kagoshima, Okinawa, Taiwan and Chosen and the adjacent seas, is in the charge of the Sasebo Naval Station.

The coasts and adjacent seas of the South Sea Islands, now under mandate to Japan, are in the charge of the Yokosuka Naval Station. There are also auxiliary naval stations at Maizuru in Kyoto prefecture, Ohminato in Aomori prefecture, Chinkai in Chosen, Mako in the Boko Islands (Pescadores) and Ryojun (Port Arthur) in Kwantosyu (Kwantung).

The naval districts have each a naval barrack, which is responsible for the defence of the naval port where it is posted, besides being required to protect the neighbouring district from attack. In addition to the naval barrack, each naval station or auxiliary naval station has a defence corps, which is responsible for the defence of the neighbouring seas. Where there is no naval barrack, the defence corps is required to take care of the port where it is stationed and to protect the neighbouring district from attack. The naval ports and auxiliary naval ports have respectively one or more air force detachments, which are required to protect the port and neighbouring district from naval and aerial raids.

Naval Office in Manchoukuo

Japan's recognition of Manchoukuo and provisions of the Japan-Manchoukuo Protocol might have necessitated military and naval actions in that country on the part of Japan and to meet the possible emergency the Navy Department of Japan issued a law in March, 1933, for the establishment of the Imperial Naval Office in Manchoukuo to be located in Hsinking.

The Office takes charge of the watch and protection of the rivers and the coast lines of Manchoukuo. The commander is directly under the Emperor, and as to the administration he acts in accordance with the order of the Minister of the Navy of Japan. At present a provisional Naval Defence Brigade is quartered at Harbin and is guarding the banks of the Sungari.

Ryojun (Port Arthur) Naval Station

The Imperial Naval Station at Port Arthur was abolished in November, 1922, according to the Naval disarmament programme. But the newly created situation in Manchuria made it a matter of necessity to revive it and it was re-established in April, 1933. The station is under a special regulation independent of the Naval stations in home land. It has a specific duties in the Kwantung Leased Territory and is engaged in the protection of the coasts of Kwantung Province, Manchoukuo and the North China above the Yangtze.

The Standing Fleets

The standing fleets as reorganized on November 15th, 1934, are as follows :

Combined Fleet

The Combined Fleet is organized with the 1st and 2nd fleets.

1st Fleet

1st Squadron—Haruna, Fuso, Yamashiro, Isé.
8th Squadron—Nagara, Isuzu, Natori.
1st Destroyer Squadron—Abukuma, 21st, 22nd and 29th destroyer flotillas.
1st Submarine Squadron—Tama, 7th and 8th submarine flotillas.
1st Air Force Squadron—Hosho, Ryujo, and 5th destroyer flotillas.

2nd Fleet

4th Squadron—Takao, Atago, Maya and Chokai.
6th Squadron—Kinukasa, Furutaka and Aoba.
2nd Destroyer Squadron—Jintsu, 6th, 10th, 19th and 20th destroyer flotillas.
2nd Submarine Squadron—Yura, Chogei, 18th

Digitized by Google

28th, 29th submarine flotillas.
2nd Air Force Squadron—Akagi, and 9th destroyer flotillas.

3rd Fleet

10th Squardon—Kuma, Iwaté.
11th Squadron—Tsushima, Ataka, Toba, Seta, Katada, Hira, Hotzu, Atami, Futami, Urakasé, Tsuga.
5th Destroyer Squadron—Tatsuta, 16th, 28th destroyer flotillas.

Training Squadron

Yakumo, Asama

The Naval Air Force

The Naval Air Force of Japan consists of:

(1) 7½ aeroplane corps, 5 aeroplane corps at Yokosuka, 5½ aeroplane corps at Tateyama, 1-½ aeroplane corps at Sasebo, 2½ corps at Omura, 1½ corps at Kuré, 1½ Corps at Saheki and ½ Corps at Ominato, the number of planes belonging to these air corps are unavailable; and (2) the aircraft-carriers proper, Kaga, Akagi, Hosho, Notoro, Ryujo, Kamoi and several other ships, the number of planes carried are unavailable. Flying officers and men number over 10,000.

The Personnel

The personnel of the naval service, including the air force, for the four years ending 1933 was as follows:

	Active Service	Reserve (1st & 2nd)	Total
1930	82,288	51,592	133,880
1931	81,299	53,355	134,654
1932	86,849	52,839	139,688
1933	87,387	52,031	139,418

Classified according to ranks, those on the active list were as follows in February, 1934:

Admirals to Rear-Admirals and non-executive officers	135
Captains to Lieut.-Commanders and non-executive officers	2,270
Lieutenants to 2nd Sub-Lieutenants and non-executive officers	2,500

Warrant officers	1,805
Cadets at school	556
Petty officers and men	78,676
Total	87,737

Equipment Each naval station is equipped with a shipbuilding yard, and one or more dry docks for accommodating warships. The Yokosuka and Kuré arsenals are capable of taking in superdreadnoughts of over 40,000 tons, but those of Sasebo and Maizuru are only fit for building cruisers and smaller ships. There are a number of up-to-date private establishments, such as the Mitsubishi shipyard at Nagasaki, Kawasaki shipyard at Kobé, Fujinagata shipyard at Osaka, and Ishikawajima shipyard at Tokyo. Of these the Mitsubishi and Kawasaki shipyards are capable of building superdreadnoughts.

Warship Building

The first warship built in Japan was the Seiki (870 tons) launched at Yokosuka in 1875. She played an important part in the civil war of 1877. The Hashidaté (4,228 tons), launched just before the Sino-Japanese War of 1894-5, remained the largest warship built at home until 1903. Soon after the Russo-Japanese War, Japan succeeded in building the battle-cruisers Tsukuba (13,800 tons), Ikoma, and Kurama (14,600 tons each), the battleships Satsuma (19,300 tons), Aki (19,250 tons), Kawachi and Settsu (20,800 tons each). The two last named were the first dreadnoughts planned and constructed at home and marked a new stage in the progress of naval architecture in Japan.

The Tsukuba and Kawachi sank 18 and 17 years ago respectively as a result of an explosion of their magazines, the former at Yokosuka and the latter at Tokuyama, while the Satsuma and Aki were removed from the list and sunk in target practice.

Digitized by Google

The Settsu has been converted into a target ship of 16,130 tons and is still in service.

Independent of Foreign Material Up to recent years, Japan was dependent on foreign countries as regards war material, but is now almost independent in this connection. She has ample supplies of coal, iron, copper and zinc as long as she controls the mines in Manchuria. At present 95 per cent. of warship building materials is of home production and in case of international competitive building of warships Japan will lose little out of the competition in international payments. The supply of crude oil is still insufficient, but the rapid progress in the oil-shale industry of Manchuria, and the remarkable development of the oil industry in North Saghalien, Formosa, etc., show that the empire will shortly be self-sufficing in this respect also. The Imperial Iron Works at Yawata (Kyushu) has an annual output of about 200,000 tons armour plates, rails, etc., while the Muroran Steel Works of Hokkaido is turning out an ample quantity of steel for use by the Army and Navy. In the chemical industry also, Japan is now almost independent and prepared for any form of chemical warfare. In the Russo-Japanese War, the 6 battleships and 6 armoured cruisers of the Japanese fleet were all built in England, and the officers and men could fire no guns without optical implements made in foreign countries. The Navy of today is independent in every sense of the word.

List of Ships

The Navy consisted on July 30, 1935 of the following ships, classified by types with the total tonnage in each :

Type	Number	Tonnage
Battleships	9	272,070
Training Battleship	1	19,500
1st Class Cruisers	12	107,800
2nd Class Cruisers	24	90,255
Aircraft Carriers	5	68,370
Seaplane Carriers	3	31,050
Submarine Tenders	5	31,015
Mine Layers	6	15,230
Coast Defence Vessels	7	55,450
Gun Boats	11	5,045
1st Class Destroyers	76	89,439
2nd Class Destroyers	30	23,390
1st Class Submarines	37	43,057
2nd Class Submarines	30	23,822
Torpedo Boats	9	2,108
Mine Sweepers	16	9,258
Special Service Ships	22	227,477
Total	305	1,114,336

(Tonnage of ships under construction is not included.)

The full individual list of warships at the same date was :

The planes

The battle planes in use in the Naval Air Force are of type 3 and type 90. The bombers and torpedo planes in use are of type 13, type 89 and type 92. Some of these machines played an important part in the Sino-Japanese conflict in Shanghai, but some of them are not suitable for an aerial war in the future.

The reconnoitering planes in use are of type 14. They are equipped with a 450 h.p. motor and can cover nearly 200 kilometres an hour. They are armed with a machine-gun mounted behind the seat of the reconnoitering officer, so that he can defend the machine against enemy fire from behind. Their speed is considered too slow for satisfactory service in the future. There are also in use type 15 and type 90.

There are also a few large patrol planes of type 90. No. 1 of these is of metallic material, 21 metres long, 30 metres wide, 12 tons in weight, and is equipped with a number of motors producing 2,100 h.p. in all. Its maximum speed is 220 kilometres an hour. The No. 2 of type 90 is 20 metres long, 30 metres wide, 13 tons in weight, and equipped with motors producing 2,400 h.p. in all. Both of them are superior in capacity to the PN-12 of the American Navy, which has a speed of less than 200 kilometres.

OCCUPANTS OF SENIOR COMMANDS

(July 31, 1935)

Name and Rank		Command
(1) FLEETS AND SQUADRONS:		
Admiral	Sankichi Takahashi	Combined Fleet and 1st Fleet
Vice-Admiral	Mitsumasa Yonai	2nd Fleet
Vice-Admiral	Gengo Hyakutaké	3rd "
(2) YOKOSUKA NAVAL STATION:		
Admiral	Nobumasa Suetsugu	Naval Station
Vice-Admiral	Toyotaro Murata	Naval Dockyard
Vice-Admiral	Kenji Maebara	Naval Aeronautical Arsenal
(3) KURÉ NAVAL STATION:

Vice-Admiral	Hajimé Matsushita	Maizura Auxiliary Station
Rear-Admiral	Chonan Yamaguchi	Ominato ,,
Vice-Admiral	Hiroshi Ono	Mako ,,
Vice-Admiral	Seizaburo Kobayashi	Chinkai ,,
Rear-Admiral	Kichijiro Hamada	Ryojun ,,
Vice-Admiral	Shidzué Tsuda	Manchoukuo Naval Office
Rear-Admiral	Teiryo Araki	Landing Party at Shanghai

Presidents of Naval Schools

Vice-Admiral	Tsugumatsu Inoué	Naval War College
,,	Koshiro Oikawa	Naval College
,,	Muneyoshi Ueda	Naval Engineering College
Surgeon Rear-Admiral	Yoshiro Mukoyama	Naval Medical College
Paymaster Vice-Admiral	Yasuo Ikebé	Naval Paymasters' College
Rear-Admiral	Keigi Tabata	Naval Gunnery School
,,	Jugoro Arichi	Torpedo School
,,	Satoshi Furihata	Naval Communications School
Vice-Admiral	Hoichi Wanami	Submarine School
Rear-Admiral	Tomisaburo Otagaki	Navigation School
,,	Hiroshi Kawahara	Naval Mechanists' School

Naval Promotion

Officers are promoted by selection, and candidates for special promotion are selected at the conference of the Admirals' Council.

The regular course of promotion for them is: Midshipmen, over one year's service on a training ship; 2nd Sub-Lieutenants, over one year's service; 1st Sub-Lieutenants, over 18 months' service, including 6 months' service in Torpedo or Gunnery School. Lieutenants of over 4 years' service are promoted to Lieutenant-Commander.

Special service 1st Sub-Lieutenants, over two years' service; Special service 2nd Sub-Lieutenants, over three years' service. Special service Lieutenants (combatants, engineers and paymasters) may be promoted to Lieutenant-Commander by special appointment.

The qualifications for subsequent promotion are as follows:

Promotion	Minimum Service in Lower Rank
Commanders—Lieutenant-Commanders	2 years
Captains—Commanders	2 ,,
Rear-Admirals—Captains	2 ,,
Vice-Admirals—Rear-Admirals	2
Admirals—Vice-Admirals	Period determined by Imperial order subject to special merit

N. B. 1st class warrant or ranking officer of over 6 years in the service may be promoted to 1st Lieutenant or ranking officer.

CHAPTER VIII

PUBLIC FINANCE

General Outline

The total revenue and expenditure of the Japanese Government at the beginning of the Meiji Era were maintained around the ¥30,000,000 mark, but in recent years they have reached as high as from ¥1,500,000,000 to ¥1,800,000,000 each (for general accounts only).[1]

Sources of Income Early in the Meiji Era the land tax constituted the chief financial source of revenue for the State, consequently the farmers provided by far the greater part of the revenue, and the burden business men and industrialists had to bear for the State was very small. The tax revenue in the first year of Meiji amounted to ¥3,150,000, of which the land tax yielded more than 60 per cent. A tax revision was carried out in 1875 and, in consequence, the Government established various new taxes as direct sources of State income.

The Sino-Japanese and Russo-Japanese wars also brought about noteworthy changes in the State finances, because the necessary funds were raised by the issuance of bonds and the imposition of heavy taxes on people. As the Taisho Era coincided with the World War and post-war prosperity periods it was marked by phenomenal business and industrial expansion and increase in State revenue. During this time it became more than apparent that a thorough readjustment of the tax system was necessary, if the burden of taxation was to be equitably distributed. A thorough investigation was made, and after much forethought and drawing on experiences of the past the present system was evolved. The yearly tax revenue in recent years has been around ¥900,000,000, which is 60 per cent. of the total State expenditure. The customs tariff, because of its international aspect was harder to arrange and the adoption of a national tariff by Japan instead of a conventional one was only realized after difficult diplomatic negotiations.

Japan has a monopoly system of its own, and though a monopoly differs from a tax in principle it is the same in substance. In Japan proper there is a government monopoly in tobacco, salt and camphor and in the colonies one is enforced in saké, opium, ginseng and other special products. The tobacco monopoly is not different in nature from the excise tax on saké distillation and the revenue accruing from it occupies an important position in government finance. It is thus necessary, to obtain a complete understanding of the financial system of Japan, not to ignore the monopoly.

Bonds form an integral part of the country's finance as well as the State revenue and taxes. Bonds were first issued in Japan in 1870 in the form of foreign loans. The first domestic bonds were issued in 1873 by the Meiji Government for the purpose of raising funds to take over the entire amount of debts of the feudal clans. Subsequent issues of bonds followed the outbreak of the Sino-Japanese and Russo-Japa-

1 For a detailed historical account of public finances see The Japan Year Book, 1933, Chapter IX.

Digitized by Google

nese wars. The nationalization of the railways caused a further increase in the bond issue and at the end of 1912, the closing year of the Meiji Era, the total debts of the Central Government amounted to ¥2,500,000,000. During, and immediately after the Great War, there was great activity in financial circles and the Government made large issues of bonds for the purpose of obtaining funds for starting or subsidizing various new industries. The expenses of the Siberian Expedition and Japan's participation in the World War on the Allies' side were met by bond issues as emergency funds and later, the money necessary for the reconstruction of Tokyo and other Kwanto districts devastated by the great earthquake and fire of 1923 was also raised by means of domestic and foreign bonds. The Government also had to issue a great number of bonds for readjustment of the so-called Earthquake Bills and for special loan accommodation to banks after the banking crisis of 1927. Japan's national debts have thus mounted to more than ¥6,000,000,000.

Local Finance Provincial government finance has moved in line with the Central Government finance. The feudal clans were abolished and replaced by prefectural governments in July, 1871, and the total prefectural finance was only ¥16,000,000 in 1873. The promulgation of the city, town and village administration system in 1888 and that of the prefectural administrative system in 1890 were great events marking the establishment of self-government. Provincial expenditure which amounted to ¥43,000,000 in 1891, had increased to ¥836,000,000 by 1926, the largest increase being in the Taisho Era, when, benefiting from the effects of the war-boom on domestic finance and economy and following the lead and encouragement of the Central Government, the prefectural and other self-governing bodies launched all kinds of enterprises, issuing bonds and increasing local taxes to obtain the necessary funds. In the fiscal year 1927-28 the total revenue of all self-governing bodies amounted to ¥2,247,827,513, although it dwindled in subsequent years, the fiscal year 1932-1933, showing a figure of ¥1,473,451,698.

Accounts System

In the second year of Meiji, 1869, Shigenobu Okuma (later Marquis Okuma) submitted to the Government a plan calling for the establishment of an accounts system to prevent a reckless disbursement of administrative expenses. In due course, and as a result of this plan, a Ministry of Finance and a fiscal year starting with October and ending with September were instituted. When Hirobumi Ito (later Prince Ito) came home from his inspecting trip to America in 1873, he offered valuable advice to the Government on a financial system and this caused the Government to announce its estimates of accounts. This marked an important point in the accounts system of Japan as it was the prototype of the Government budget, but because of the lack of system, the budget of each Ministry was subject to change by the administrative chief. The fiscal year was changed to from April to March in 1886, and has been so observed since. The opening of the Imperial Diet in 1890 brought about a great improvement in the accounts system of Japan, for each budget has since been subject to approval, and Government income and expenditure has thus come under supervision. The Board of Audit under direct control of the Emperor was also established and to it is assigned the duty of inspecting the

Digitized by Google

Government accounts. These perfected the constitutional accounts system of the Government and at the same time the Accounts Law was promulgated in 1889 and has been enforced since April 1, 1890. This law laid the foundation of the accounts system of Japan and in 1921 it was revised from the so-called "safe" system to the "deposit" system, i. e. the depositing of Government funds in the Bank of Japan.

Special Accounts

Special accounts for the Government's enterprises existed independently of general accounts, before the promulgation of the Accounts Law in 1889. Railway funds, readjustment loans, enterprise funds, hypothec funds and others were included among the special accounts, which were unified by a law issued in 1889. The number of special accounts for the 1890-91 fiscal year was 33, which increased to 61 in 1908. Mr. Yuko Hamaguchi, Finance Minister of the Katō (Takaaki) Cabinet, made a substantial readjustment of special accounts in 1925 and reduced the number to 31. Subsequently, the health insurance special accounts, the postal annuity special accounts and live-stock reinsurance special accounts were established. In 1934 government steel works was omitted and communication enterprises was put into the list instead. The present number of special accounts is 34 and is as follows: (1) China Cultural Enterprise, (2) Health Insurance, (3) Government Mint, (4) Printing Bureau, (5) Monopoly Bureau, (6) Deposits Bureau, (7) Education Funds, (8) National Loan Readjustment Funds, (9) Public Loans, (10) Indemnity, (11) National Property Readjustment Funds, (12) Education Improvement and Agricultural Village Promotion Funds, (13) Korean Government-General, (14) Korean Railway Stores Funds, (15) Formosan Government-General, (16) Formosan Railway Stores Funds, (17) Kwantung Government, (18) Karafuto Government, (19) South Seas Government, (20) Army Arsenals, (21) Senju Military Cloth Manufactory, (22) Naval Arsenals, (23) Naval Gunpowder Magazines, (24) Naval Fuel Factories, (25) Imperial Universities, (26) Government Colleges, (27) Government Schools and Libraries, (28) Rice Demand and Supply Regulation, (29) Live-Stock Reinsurance, (30) Post Office Life Insurance, (31) Korean Post Office Life Insurance, (32) Postal Annuity Service, (33) Imperial Government Railways, and (34) Communication Enterprises.

Finance of Sino-Japanese War

The Sino-Japanese War imparted a great impetus to Japanese finance. The war started in June, 1894, and ended in March, 1895. The enormous amount of ₹200,000,000 was needed to pay for it.

Japan got 200,000,000 taels of war indemnity from China as the result of the Shimonoseki Peace Treaty and also 35,000,000 taels as recompense for the retrocession of Liaotung Peninsula. This amount made good the war expenses Japan paid, but immediately after it State finance increased tremendously. The Government appropriated ₹190,000,000 into the general budget for the 1896-97 fiscal year, being double that of the year before. The increase was caused through armament expansion, the management of Formosa (which was the territory ceded by China), expansion of traffic and communications and sundry other enterprises necessary for national development. The Government appropriated for 32 kinds of continuation enterprises ₹180,000,000 in 1896

Digitized by Google

and of this amount ¥48,000,000 was apportioned for that year only. The majority of continuation enterprises were armament expansion such as ¥47,000,000 for warship construction, ¥33,000,000 for naval ordnance, ¥17,000,000 for army expenses, and ¥14,000,000 for naval construction. These enterprises spread over from two to nine years. It is necessary to explain the war indemnity special accounts to know the financial expansion. Converted into the Japanese currency, the indemnity totalled ¥372,599,488. Excluding the maintenance funds for the Weihaiwei guard, the indemnity of ¥364,599,656 was used for the following purposes:

All supplementary funds to extraordinary war funds	¥ 78,957,164
Army expansion funds	56,798,638
Navy expansion funds	139,259,397
Establishment of Government Steel Works	579,762
Transferred to general accounts for 1897-98 fiscal year	3,214,484
Transferred to general accounts for 1898-99 fiscal year	12,000,000
Transferred to Imperial Household accounts	20,000,000
Warship and torpedo funds	30,000,000
Educational funds	10,000,000
Balance at the end of 1902-3 fiscal year	3,700,218

Russo-Japanese War and Post-War Finance

The Russo-Japanese War began in February of 1904 and ended in September of 1905 with the conclusion of the Portsmouth Treaty. Japan spent ¥1,716,000,000 in war expenses (extraordinary war funds special accounts) during the period of one year and four months. In addition, extraordinary expenses spent by various Ministries in connection with the War amounted to ¥238,000,000, thus making an aggregate of ¥1,954,000,000. The war funds were raised by means of taxes to the amount of ¥215,000,000, surplus funds totalling ¥147,000,000, special funds of ¥670,000,000 (an aggregate of ¥430,000,000), and the remainder by floating public loans and obtaining temporary advances totalling ¥1,559,000,000. The Government increased taxes on all the principal items on the tax list and also expanded the spheres of the oil consumption tax and the tobacco monopoly system, thereby raising ¥62,000,000. It also established the textile consumption tax and transit tax and introduced the salt monopoly, thereby realizing an income of ¥74,000,000. During the time the War was in progress, four new Divisions were formed with the approval of the Diet. In the 1906-7 fiscal year two more Divisions were established. In consequence, six Divisions were added to the existing 18 Divisions and these constituted the standing army. In the Navy, two warships, the Nisshin and Kasuga, were purchased during the War, and after the War naval expansion was carried out, resulting in the increase of total warship tonnage from 260,000 tons before the War to 513,000 tons in 1908. The railway nationalization bill was approved in the 22nd session of the Imperial Diet and was enforced in 1907. The Government issued ¥476,000,000 bonds for the purpose of nationalization. A considerable increase was made in State expenditure after the War. The 1904-5 fiscal year's expenditure of the general accounts totalling ¥277,000,000 increased to ¥600,000,000 in 1907 and those of the special accounts made a remarkable increase from ¥130,000,000 to ¥678,000,000 during the same period. In tax revenue, the amount of

Digitized by Google

¥190,000,000 for 1904 doubled by 1907. Cries for financial retrenchment began to be heard. The Saionji Cabinet and the second Katsura Cabinet tried to retrench but without success.

Finance during the Taisho Era

A financial retrenchment policy was adopted by the Government early in the Taisho Era. Japan's foreign trade witnessed a marked increase in the excess of imports and its national debts increased heavily. The specie reserve quickly dwindled. How to bring about an equilibrium in the international debit and credit relations formed a source of great concern. A great change was made in Japan's financial and economic conditions by the outbreak of the World War in July, 1914. Japan participated in the War on the Allies' side and sent its expeditionary force to Shantung. The Okuma Cabinet was responsible for Japan's participation. Prior to this, a two-Division increase controversy formed the cause of the downfall of the Saionji Cabinet, but the outbreak of the War solved the problem. Two army divisions were established in Korea. The army readjustment plan, the eight-four squadron programme, naval construction and other wartime expenses contributed to a financial expansion. The Government expenditure for the 1918-19 fiscal year totalled more than ¥1,000,000,000, showing a 40 per cent. gain over the year before. The continuation expenses commencing with the 1918-19 fiscal year totalled more than ¥1,000,000,000. The Government revised taxes, raised the income tax by 15 per cent., alcoholic drink tax by 14 per cent. and beer tax by 20 per cent. and established a wartime profit tax, the result being an increased revenue of ¥63,000,000.

The World War Japanese economic prosperity attained its high-water mark during the World War. A considerable increase was made in the country's visible and invisible foreign trade. An excess of exports over imports in the visible trade for 1915, 1916, 1917 and 1918 recorded an aggregate of ¥1,400,000,000 and that in the invisible trade reached nearly the same amount. This resulted in a remarkable increase of specie. The amount of specie holdings at the end of 1914 was only ¥340,000,000, but this had increased to as much as ¥2,180,000,000 by the end of 1920. The Hara Cabinet which replaced the Terauchi Cabinet in September, 1918, took advantage of the war-time boom to carry out an inflation policy, funds being specially allotted to armament replenishment and to the perfecting of traffic and communication arrangements. In connection with the completion of the eight-eight battle squadron programme, sponsored by the navy, the continuation expenses of ¥408,000,000 for warship construction were increased by ¥750,000,000. National defence expenses involving the army and navy totalled ¥620,000,000, of which ¥242,000,000 was for the army and the rest for the navy. A new appropriation of ¥225,000,000 was added to the existing appropriation of ¥292,000,000 for the telephone enterprise, to be disbursed over eight years commencing 1920; and in the telegraphic enterprises ¥74,000,000 was to be spent in the following seven years. The enormous amount of ¥1,420,000,000 was set aside for railway enterprises, spread over 10 years. The Government expenditure for the 1922-23 fiscal year totalled ¥1,491,000,000. To raise this amount bonds were issued, the sinking fund was suspended and taxes increased. The great financial reaction that

Digitized by Google

overtook Japan in 1920 and the great Kwanto earthquake and fire of 1923 precipitated Japanese finance and economy into a miserable plight. These incidents virtually formed the causes of the difficulties in national finance and economy which now faced the country.

Financial Readjustment The Katō (Tomosaburo) Cabinet carried out a great financial readjustment. The Washington Treaty was ratified in Japan in August, 1922. According to the 1923-24 fiscal year's budget formulated by this Cabinet the basic naval plan was so changed that the Government reduced naval continuation expenses by ¥200,000,000 and was also able to make a cut of ¥70,000,000 in other enterprises. Substantial cuts were made in the income, business, stamp and drug taxes and the oil consumption tax was abolished. The reduction totalled ¥14,000,000. The sinking fund system was restored and ¥42,000,000 was devoted to it. Immediately after the death of Premier Viscount Katō in August, 1923, the great Kwanto earthquake took place. The disbursement of ¥572,000,000 on a six-year programme for earthquake reconstruction work was fixed by the Yamamoto Cabinet that succeeded the Kato Cabinet, and all these expenses were to be raised by bonds. The Yamamoto Cabinet was in existence for only four months and the Kiyoura Cabinet, which succeeded it, had to enforce the plan. The Government raised a £25,000,000 loan in London and a $150,000,000 loan in New York. These foreign loans totalled ¥550,000,000, and of this ¥350,000,000 was devoted to the conversion of sterling bonds, which matured in February and July, 1925, and the remaining amount was used for earthquake and fire reconstruction. A financial retrenchment policy was adopted by the Coalition Cabinet headed by Premier Count Takaaki Kato of the Kenseikai. The Cabinet was inducted in June, 1924. To begin with, a no-loan policy was adopted by the Cabinet and taxation readjustment was also enforced. An independent Kenseikai Cabinet took the place of the Coalition Cabinet in March, 1925. Thoroughgoing revision was introduced into the income, land, business, inheritance, saké, textile consumption and hemp taxes. The transit, soy sauce, and drug taxes were revised and the capital interest and soft drink taxes were created. A reduction of ¥37,000,000 in taxes was realized for the 1926-27 fiscal year.

Finance of the Showa Era

For the first six years of Showa, 1926-32, two Seiyukai and two Minseito Cabinets came into power in turn. The former stands for a traditional inflation policy, while the latter for a deflation policy. Financial retrenchment was carried out by the Minseito Cabinet and the gold embargo was lifted by the Hamaguchi Cabinet (Minseito) on January 11, 1930. Mr. Junnosuké Inouyé, Finance Minister of that Cabinet, adopted a no-loan policy. A noteworthy financial retrenchment was carried out by Mr. Inouyé in the 1930-31 fiscal year's budget and, in spite of a strenuous protest of the army and navy against the retrenchment, he was successful in effecting a saving of ¥35,063,000, of which ¥26,733,000 was the result of reduction of administrative expenses and ¥8,330,000 by the postponement of different enterprises.

The reduction is classified as follows according to various Ministries :

Digitized by Google

Ministries	Amounts saved in administrative expenses	Expenses saved by postponing enterprises	Total amount saved
	(In ¥1,000)		
Foreign	241	—	241
Home	5,114	1,669	6,783

Agriculture and Forestry	1,843	1,638	3,481
Commerce and Industry	287	171	2,502
Overseas	2,347	—	2,347
Total	26,733	8,330	35,063

The Inukai Cabinet that succeeded the Wakatsuki Cabinet on December 16, 1931, decided to adopt the budget drafted by the preceding Cabinet, due to lack of time to formulate a new one. However, the new Cabinet determined not to abolish the Overseas Ministry and other administrative organizations, which were decided on by the Wakatsuki Cabinet, but decided to carry out administrative readjustment. The sinking fund system was temporarily suspended and the deficient income was to be met by loans.

Revenue and Expenditure, 1868 to 1935

The revenue and expenditures from 1868 to 1935 are given below:

	General accounts		Special accounts		Tax Revenue
	Revenue	Expenditures	Revenue	Expenditures	
	(In ¥1,000)				
1st period	33,089	30,505	—	—	3,157

Budget for the Fiscal Year 1934-35

The Budget Estimates for the fiscal year 1934-35, comprising those for the General Account and Special Accounts, passed the Diet in the 65th Session (December 1933 to March 1934). Of these, the Budget for the General Account, inclusive of the Supplementary Budget, is balanced at ¥2,142,528,079, as the following table shows :

Revenue	
Ordinary	¥ 1,248,543,502
Extraordinary	893,984,577
Normal Revenue	63,367,450
Receipts from the Issue of Public Loans	811,189,439
Transfer of Surplus from the Preceding Year	19,427,688
Total	2,142,528,079
Expenditure	
Ordinary	1,247,562,234
Extraordinary	894,965,845
Total	2,142,528,079

It should be noted that a Special Account for Postal, Telegraph and Telephone Services was created as from April 1, 1934, and with respect to such services no appropriations were made in the Budget for the General Account for the fiscal year 1934-35.

Comparison of 1934-35 with 1933-34 General Account. The Budget for 1934-35 shows, in comparison with the Budget for 1933-34, a decline of ¥177,976,146 in revenue and expenditure respectively. This decline is explained by the fact that the postal, telegraph and telephone services, for which appropriations had been formerly made in the Budget for the General Account, were segregated into a Special Account as from April 1, 1934. If, however, the appropriations for postal, telegraph, and telephone services are separated from the Budget for the General Account for 1933-34 and such a Budget is called for the sake of convenience the "Adjusted" Budget, the Budget for 1934-35 will show an increase of ¥13,188,939 over the figures of ¥2,129,339,140 of the "Adjusted" Budget for 1933-34. The following are the comparisons of the Budget for 1934-35 with the Budget for 1933-34 and the "Adjusted" Budget for 1933-34 :

	Budget 1934-35	Budget 1933-34	x "Adjusted" Budget 1933-34	Increase(+) or Decrease(−) compared with Budget 1933-34	Increase(+) or Decrease(−) compared with "Adjusted" Budget 1933-34

Total	2,142,528,079	2,320,504,225	2,129,339,140	(−)177,976,146	(+) 13,188,939

Digitized by Google

Expenditure	Yen	Yen	Yen	Yen	Yen
Ordinary	1,247,562,234	1,374,669,853	1,209,226,114	(−)127,107,619	(+) 38,336,120
Extraordinary	894,965,845	945,834,372	920,113,026	(−) 50,868,527	(−) 25,147,181
Total	2,142,528,079	2,320,504,225	2,129,339,140	(−)177,976,146	(+) 13,188,939

Note:—(1) For comparison with the Budget for 1934-35, certain adjustments were made in the figures of the Budget for 1933-34.

(2) x The "Adjusted" Budget represents the Budget as calculated, for the sake of convenience, by excluding the estimated revenue and expenditure for postal, telegraph and telephone services from the Budget for the General Account for 1933-34.

Special Accounts. As the Special Account for Imperial Iron Works was abolished on March 31, 1934 and the Special Account for Postal, Telegraph and Telephone Services was created as from April 1, 1934, there are, at present, 34 Special Accounts. The Budget for 1934-35 for the most important Special Accounts and comparisons with the Budget for 1933-34 are as follows:

(a) Imperial Government Railways' Special Account

	Budget 1934-35	Budget 1933-34	Increase (+) or Decrease (−) compared with 1933-34
Capital Account	Yen	Yen	Yen
Revenue	113,133,216	104,824,844	(+) 8,308,372
Expenditure	121,633,216	104,824,844	(+) 16,808,372
Stores Account			
Revenue	188,160,000	166,659,000	(+) 21,501,000
Expenditure	188,160,000	166,659,000	(+) 21,501,000
Profit and Loss Account			
Revenue	674,887,694	583,806,247	(+) 91,081,447
Expenditure	611,754,478	528,981,403	(+) 82,773,075

(b) Special Account for Postal, Telegraph and Telephone Services

	Budget 1934-35	*Budget 1933-34	Increase (+) or Decrease (−) compared with 1933-34
Capital Account	Yen	Yen	Yen
Revenue	35,813,338	27,399,426	(+) 8,413,912
Expenditure	35,313,338	27,399,426	(+) 8,413,912
Stores Account			
Revenue	34,472,677	28,243,555	(+) 6,229,122
Expenditure	34,472,677	28,243,555	(+) 6,229,122
Working Account			
Revenue	273,324,351	242,599,686	(+) 30,724,665
Expenditure	264,126,381	239,871,650	(+) 24,254,731

Note:—* The Special Account for Postal, Telegraph and Telephone Services did not exist in the fiscal year 1933-34, nevertheless, the figures were given for comparison in the above table by separating the amounts coming under such items from the Budget for the General Account for 1933-34.

(c) Special Accounts for Special Regions

	Budget 1934-35	Budget 1933-34	Increase (+) or Decrease (−) compared with 1933-34
(1) Chōsen (Korea)	Yen	Yen	Yen
Revenue	258,604,398	232,026,949	(+) 26,577,449
Expenditure	258,591,605	232,026,949	(+) 26,564,656
(2) Taiwan (Formosa)			
Revenue	110,821,261	104,085,344	(+) 6,735,917
Expenditure	110,821,261	103,160,243	(+) 7,661,018
(3) Kwantung	22,911,058	27,182,812	(−) 4,271,754
(4) Karafuto (Japanese Saghalien)	25,929,056	23,566,668	(+) 2,362,388
(5) Nanyō (Mandated Territories in the Pacific)	5,635,675	5,628,918	(+) 6,757

Note:—In the Special Accounts coming under (3), (4), and (5) revenue and expenditure balance exactly.

Budget for 1935-1936

The gist of Mr. Korekiyo Takahashi's explanation of the Budget for 1935-36 made for the 67th Session of the Diet on January 22, 1935, is taken in the following as giving a general trend of the finance of the country.

The total amount of the estimates of ways and means during 1935-36 is over ¥2,193,000,000 on both sides of revenue and expenditure. The estimate of revenue covers over ¥1,335,000,000 in ordinary account and a little over ¥857,000,000 in extraordinary account, while that of expenditure covers over ¥1,293,000,000 in ordinary account and a little over ¥900,000,000 in extraordinary account. Compared with the general budget of the previous year there is an increase of over ¥87,000,000 in the ordinary revenue and a decrease of over ¥107,000,000 in the extraordinary, which means a decrease of over ¥20,000,000 in revenue. As for expenditure, there was an increase of over ¥45,000,000 in the ordinary account, whilst there was a decrease of ¥65,000,000 in the extraordinary account, which means a decrease of over ¥20,000,000 in the total expenditure. As compared with the previous year, receipts from land, liquor and stock exchange taxes decreased while that from the income tax increased by ¥30,800,000, the business profit tax by ¥6,200,000, the import tariff by ¥15,600,000 showing an increase of over ¥53,400,000 in the aggregate tax revenue. As for the receipts other than taxes there is an increase of over ¥8,500,000 from stamps, of over ¥5,900,000 from forests, of over ¥7,500,000 in the profit of the Monopoly Bureau and of ¥4,800,000 in the receipts from dividends and the net increase in the ordinary revenue amounts to over ¥87,000,000.

In making up the expenditure budget for 1935-36 the principle was that of cutting in nearly all items. Yet the outlay due to the Manchurian incident and that due to the changed exchange rate of yen reached to a considerable amount in continuation from the previous year. The present situation of international politics makes it imperative to spend an increasingly large amount for the replenishment of national defence. Various disasters occurring in many parts of the country in 1934 necessitated the expenditure of no small amount for relief purposes. It is due to all such unavoidable needs that the outgoing budget reached ¥2,193,000,000.

Digitized by Google

Outlays for the Manchurian incident comprise in the general account ¥3,600,000 under jurisdiction of the Foreign Department, ¥162,300,000 under the War Department and ¥9,600,000 under the Department of Marine and ¥5,000,000 as a reserve fund under the Finance Department, bringing about a total of ¥180,600,000, in addition to ¥3,700,000 from special accounts of the Chosen Government-General and the Kwantung Bureau. The grand total of the money which is to be expended in 1935-36 for the Manchurian trouble thus reaches ¥184,300,000, an increase of ¥25,000,000 over the previous year. This increase is chiefly due to the need of strengthening aerial forces. As for the outlay for the improvement of naval and military armaments, it totals ¥366,300,000, of which ¥228,400,000 is the amount already anticipated in the 1934-35 budget. The new demand which amounts to ¥137,800,000 is itemized as follows: ¥16,200,000 in the ordinary section and ¥20,000,000 in the extraordinary section both under the Department of War and ¥7,800,000 in the ordinary section and ¥93,700,000 in the extraordinary section both under the Department of Marine.

As regards the disbursements required to meet the emergent need arising out of the flood, typhoon and other calamities that occurred in various parts of the country in 1934 ¥66,100,000 is appropriated as a portion to be required in the fiscal year 1935-36. As for the outlays due to the changed exchange rates appropriation has been made for ¥74,500,000 in the general account and ¥12,300,000 in the special accounts making a total of ¥86,800,000.

Temporary profit tax. Under the present circumstances certain industries are realizing increased profits, and it was decided to impose a temporary profit tax upon a part of their profits, the estimated revenue from this tax for 1935-36 is ¥30,000,000.

As regards the deficit in revenue for the fiscal year under review, it will be covered by loans. Bonds providing revenue for the General Account are ¥7,400,000 in the form of the earthquake disasters reconstruction loan, ¥5,500,000 in the name of the road construction loan, ¥170,700,000 in the name of the Manchurian incident loan and ¥565,800,000 for the revenue deficit, that is, ¥749,600,000 in the aggregate; for the Special Accounts, ¥24,000,000 for the Chosen Government-General, ¥38,000,000 for the State Railways and ¥14,500,000 for the communication works, i. e. a total of ¥76,500,000. The new floatation will, therefore, reach ¥826,100,000, a decrease of ¥150,900,000 as compared with the last fiscal year.

Bonds issued since 1932 are already colossal in amount, but so far results have been successful, most of them having been well consumed, evil effects have been averted, and new bonds may meet the same speedy digestion.

BUDGET FOR 1935-1936

(in yen)

ORDINARY REVENUE

I	Taxes	Total 828,741,889
	Income tax	195,888,036

A General Survey of the Budget, 1935-36

In the budget for the fiscal year, 1935-36, two items attract attention. The one is the appropriation of a large sum for replenishment of defence work and for the readjustment services of the Manchurian incident. The other is the charge

Digitized by Google

for relief of disasters caused by the flood and typhoon, the unseasonable cold or the dry weather. Together with these a third factor is to be noticed. It is the indication that the revenues from taxes is falling, although certain industries are realizing enormous profits on account of the international situation.

The features of the 1935-36 budget may be summarized as follows:

1. Creation of the extraordinary profit tax.
2. Confinement of disbursements for the improvement of armaments to the most urgent need.
3. Cut in the outlays under the item Manchurian Incident and an increase in the outlays for air corps and other military undertakings in Manchoukuo.
4. Appropriations for the disaster-relief works.
5. Appropriations for river and harbour improvements and other public works.
6. Reduction as far as possible of appropriations for new items other than unavoidable and inevitable outlays due to the decline in the exchange value of the yen for the reimbursement of principals of loans and the payment of interest thereon.
7. Covering of revenue deficits by means of loans.

The total budget for the fiscal year, 1935-36, is as follows (in yen):

	Revenue	Expenditure
Ordinary	1,335,587,844	1,293,082,841
Extraordinary	857,826,445	900,331,448
Total	2,193,414,289	2,193,414,289

THE BUDGET FOR 1935-36, COMPARED WITH THAT FOR 1934-35

(In yen)

Division	1935-36	1934-35	Comparison In.	Comparison De.

The Extrordinary Profit Tax (Ordinance No. 37; March 29, 1935) While the general economic trend of the country is not yet quite entirely free from the effects of depression, certain industries are recording a substantial boom, owing evidently to the unstabilized international situation. The creation of the extraordinary profit tax was undertaken in order to make these industries pay a part of their profits. The outline of the tax follows:

(1) As regards corporations, their entire profits come under the taxation, while as regards individuals, their profits accruing from their business enumerated under Business Profit Tax, are liable to this tax.

(2) The profits liable to this tax are calculated, in case of corporations, by subtracting the average earning of the three successive business years prior to 1931 from the earning realized in the current year and, in case of individuals, by subtracting the average earning of the three successive business years prior to 1931 from the earning realized in the current year. When there is no such average earning or the average business earning or, when it is too small in amount, calculation is done by subtracting an amount equivalent to 7 per cent. per annum of the capital (including reserve funds) in case of corporations and ¥3,000 in case of individuals.

(3) Earnings liable to this tax are limited to sums over ¥2,000 per year.

(4) In case of individuals earnings below ¥6,000 are exempt from taxation.

(5) The rate is ten-hundredths.

It is estimated that the receipts from the profit tax will be ¥30,395,799 for the current year and ¥41,099,987 for each of the following years.

DISBURSEMENTS FOR THE IMPROVEMENT OF ARMAMENTS

(in yen)

Ministry	Appropriations already provided for	New increase	Total

Various readjustment works in the affected districts	21,585,612	11,179,851	10,190,896	214,865	Until 1963
Various measures for cocoon-raising districts	9,650,000	4,528,700	5,121,300	—	
Commerce and Industry	350,000	251,670	98,330	—	
Communications	111,203	96,741	14,462	—	
Total	216,076,343	70,691,259	66,105,116	79,279,968	

Fluctuation of Exchange Appropriations Outlays necessitated by the adverse fluctuation of exchange rates of yen are: ¥3,590,741 for reduced money value of yen in exchange for foreign currencies; ¥56,904,315 for reduced money value of yen for the payment of principals and interest of loans; and ¥14,062,916 for the increase in the residential allowances and salaries and the increase in other commodity expenses of officials staying abroad, thus bringing the total up to ¥74,557,972.

Balance of 1934-35 The revenue surplus that arises out of the 1933-34 budget is ¥77,097,358. When, out of this amount, the sum of ¥44,016,311, which is the amount necessary to be used for the revenue resources for the 1934-35 budget, is subtracted, the net surplus is ¥33,081,046. This sum of ¥33,081,046 is constituted of the following:

¥19,427,688	Balance unused of the surplus of the 1932-33 budget
13,653,358	Surplus to grow anew in the 1933-34 budget

Of the above amount the following is the amount already disbursed in the next year's budget or the amount which is to be used in the present fiscal year.

Digitized by Google

Amount used as a revenue in the fiscal year 1934-35	¥19,427,688
Amount to be used as a revenue source in the fiscal year 1935-36	7,000,000
Balance	6,653,358

This surplus of ¥6,653,358 will be used as a source of revenue for the supplementary budget of the fiscal years, 1934-35 and 1935-36.

The 1935-36 Budget and After

The View expressed by Dr. Shigeyoshi Hijikata, of the Tokyo Imperial University, in "Contemporary Japan", March, 1935, is worth reproducing

The Japanese budget, which was smaller from 1929 to 1931 owing to retrenchment and the financial and economic depression, suddenly showed an increase of more than ¥470,000,000 in 1932. While the appropriations required after the outbreak of the Manchurian Incident contributed to this sudden increase, the change in the financial policy of the Government, from retrenchment to inflation, brought about incidentally by the Manchurian outbreak, is also partly responsible.

Those who were astonished by these figures following the abrupt change from retrenchment to inflation became extremely anxious over the situation arising from necessity of balancing the budget through the issue of loans, and feared that Japan might find herself in just such a predicament as that of Germany in 1923. The situation, however, has developed comparatively quietly without having recorded any remarkable rise in the prices of commodities.

The continued increase in the budget which amounted to some ¥350,000,000 for the fiscal year 1933-34 over the figures for the previous year. While the budget for the fiscal year 1933-34 was being widely discussed, the Government authorities stated in effect that "the Manchurian incident appropriations" would be reduced to some ¥70,000,000 in the budget for the following year. Moreover, they held out hopes that, in addition to an expected natural increase in taxes and receipts from the various Government enterprises, it would be possible to work out a plan to increase general taxes and other revenues, and that the question of seeking new resources to make good the deficits in the revenues would be solved.

However, when the time came for the compilation of the 1935-36 budget expectations of a return to normal were frustrated. The estimated expenditure aggregated more than ¥2,190,000,000, which shows an increase of some ¥48,000,000 as compared with the budget for the fiscal year 1934-35. It should be borne in mind, however, that the budget for the fiscal year 1934-35 would have amounted to over ¥2,210,000,000, if the additional relief budget had been included. Thus the budget for the fiscal year 1935-36 may be taken to show a decrease of some ¥20,000,000.

Characteristic of the budget for the fiscal year 1935-36 is the reflection of the so-called "international crisis of 1935-36" in the military expenses. The estimates of the War Ministry amount to upwards of ¥490,000,000 and those of the Navy Ministry come to some ¥530,000,000. In short, slightly over 46 per cent. of the total budget is covered by military appropriations which total upwards of ¥1,000,000,000.

In the absence of a "follow-up" to the three-year plan of relief enterprises which was initiated in the fiscal year 1931-32, the ordinary expenses of both the Department of Home Affairs and the Department

Digitized by Google

of Agriculture and Forestry were increased to a certain extent. On the other hand, decreases of ¥56,000,000 and of some ¥44,000,000 respectively, were made in the special expenses of these Departments. This is why the special expenses in the budget for the fiscal year 1935-36 show a decrease of some ¥66,000,000, as compared with those in the budget for the preceding fiscal year, while the ordinary revenues are made to defray some ¥40,000,000 of the special expenses in addition to meeting the ordinary expenses. In other words, the special revenues in the budget for the fiscal year 1934-35 were barely able to defray the special expenses, while in the budget for the fiscal year 1935-36, some ¥40,000,000 of the special expenses are to come out of the ordinary revenues. Though this is a characteristic of the present budget, no clear line of demarcation is drawn between the special and ordinary items in the Japanese budget.

A third characteristic of this budget may be found in the fact that a natural increase of some ¥87,000,000 in taxes and receipts from the various Government enterprises is calculated, while the loan issue in the ordinary accounts is reduced to ¥750,000,000, or ¥130,000,000 less than similar figures in the budget for the fiscal year 1934-35. Further, a special profits tax amounting to some ¥30,000,000 is calculated in the revenues, and a tendency, slight as it is, toward the so-called "sound finance" is manifested by the intended gradual reduction of the "budget deficit" loan issue through defraying the ordinary expenses from the ordinary revenues.

The relief budget amounting to ¥70,690,000 may be more properly regarded as a part of the budget for the fiscal year 1935-36 rather than the budget for the preceding fiscal year in view of the relations of time. This would mean that the budget for the fiscal year 1935-36 is virtually larger in volume than the budget for the fiscal year 1934-35. Similarly, the loan issue included in the budget for the fiscal year 1934-35 as a part of the relief fund may be regarded as a part of the budget for the fiscal year 1935-36, thereby augmenting it still further.

In view of these facts, not only can we remark no tendency toward a gradual restoration of the so-called "normal finance" that existed prior to the Manchurian outbreak, but it may be observed that the budget is likely to remain near the ¥2,000,000,000 mark for some time to come.

The principal appropriations confirm the above remarks. An examination of the nature of the military expenses which head the list of appropriations in the budget for the fiscal year 1935-36 would lead to the conclusion that the decision reached in the previous fiscal year, far from being reduced, may even show some increase until the fiscal year 1937-38 in the appropriations for the construction of auxiliary vessels included in the so-called second naval replenishment programme. As regards the appropriations for the re-equipment of ships and the maintenance of armaments, a new item amounting to some ¥100,000,000 is included in the budget for the fiscal year 1935-36. This is in addition to ¥145,000,000 previously agreed upon.

No sudden decrease can be looked for in the appropriations for the War Ministry in view of the additional plan to expand and equip the air force. In compiling the budget for the fiscal year 1935-36, the new demand of the Navy Ministry was reduced from ¥300,000,000 to ¥130,000,000 and that of the War

Digitized by Google

Ministry from ¥246,000,000 to ¥207,000,000, but it is most probable that the two departments will make efforts, as opportunity arises, to obtain the amounts reduced. Likewise the Department of Home Affairs and the Department of Agriculture and Forestry, whose claims were reduced by 27 per cent. and 39 per cent. respectively, in view of the existing conditions of the rural districts, will probably seek some means or other to cover the deficits. Thus it is almost certain the ¥2,000,000,000 mark of the budget will remain pending some definite changes in the situation.

Just as any sudden increase is to be avoided, so care must be taken in pruning amounts which have already been augmented. Not only does any reduction in an enlarged budget meet with opposition from various quarters, but such action is apt to cause unwished-for repercussions. There is room for argument over the advisability of the Government's policy in starting public works in rural districts as a relief measure, but a sudden discontinuance of such works, once started, would be stubbornly opposed. . . .

Is there, then, any sign of the budget for the fiscal year 1935-36 being likely to cause an abnormal rise in the prices of commodities and bring about difficulties in the digestion of loans ? As a rule, the bankers who control the vast sums involved in loans and the people of moderate means who deposit small sums are opposed to a decrease in the purchasing power of the currency and a rise in the prices of commodities. Of late, however, Japanese banks have invested heavily in the munitions industry, while the influence of the people of moderate means is too weak to restrain inflation. Since the autumn of 1934, deposits have not continued to increase, while bankers have taken up fresh loans. In view of the information that many of the leading banks of the country are in possession of national loan bonds at the rate of between 20 and 30 per cent. of the deposits and that the proportion of the national loan bonds to the negotiable papers in their possession is more than 50 per cent., it is impossible to deny the threat of a dangerous degree of inflation. There is no certainty that difficulties will not be brought about by vigorous investments in the exportation business, an abnormal rise in the prices of commodities and failure to digest national loans, if there appear signs of better business in the United States and Great Britain, etc.

I have maintained the opinion that the issue of loans should be limited to ¥400,000,000 or ¥500,000,000 at the most, against the total incomes of individuals that are estimated at some ¥10,000,000,000, calculating that, on the average about 15 per cent. of the earned incomes of the people in Japan is set aside for savings or investment. The loan issue included in the general account of the budget for the fiscal year 1935-36 alone amounts to ¥750,000,000. Including the loan issue of the special accounts of the budget and the unissued amount of the loan issue of the budget for the fiscal year 1934-35, the national loans will reach the prodigious figures of ¥1,200,000,000 or ¥1,300,000,000 at the end of the next fiscal year. This amount is too large, even if the incomes of individuals have been increased to ¥13,000,000,000 or ¥14,000,000,000.

Nevertheless, it is impossible to say with any certainty that the economic world will be disturbed by a sudden rise in the prices of commodities and difficult absorption of the national loan on account of

Digitized by Google

these issues. In the event of reluctant absorption of the national loan, in all probability the Government will not hesitate in compelling the life insurance companies and trust companies, which are considered to be able to hold more loan bonds, to subscribe to them. Such compulsion is not impossible of realization so long as consciousness of the extraordinary situation remains. It also is likely that the Government will consider means of controlling exorbitant speculation on the exchanges and curbing excessive investment in new enterprises. The present conditions show that there will be no great inflation during the fiscal year 1935-36 in spite of many predictions to the contrary.

Where lie the defects and unsound factors in the 1935-36 budget? In answering this question, we have to consider whether or not the budget is excessive when compared with the national economy. As a criterion for such consideration, a comparision is made here of the changes in the volume of the budget and the earnings of the people.

	Earnings of the People	Expenditure in the General Account	Percentage
1919	10,657,190,000	1,172,328,000	11
1920	9,436,270,000	1,359,978,000	14
1921	9,982,593,000	1,489,856,000	15
1922	10,649,559,000	1,428,466,000	13
1923	10,627,532,000	1,521,050,000	14
1924	11,495,897,000	1,625,024,000	14
1925	12,353,623,000	1,524,989,000	12
1926	12,048,510,000	1,578,826,000	13
1927	12,040,327,000	1,765,723,000	15
1928	12,424,165,000	1,818,855,000	15
1929	11,918,833,000	1,736,317,000	15
1930	10,470,500,000	1,557,864,000	15
1931	9,421,424,000	1,476,875,000	16
1932	—	1,950,141,000	—
1933	—	2,309,415,000	—
1934	—	2,213,531,000	—
1935	—	2,193,414,000	—

The figures for the earnings of the people are my own calculations and it is a matter for regret that materials for such calculation after 1931 are still unavailable. It is understood that the earnings of the people are closely related to the incomes of individuals. The above table shows that the proportion of the expenditure in the general account to the earnings of the people increased from 11 per cent. to 16 per cent. between 1919 and 1931. Suppose that the incomes of the people have remained unchanged since 1931, the percentage of the expenditure in the general account of the budget for the fiscal year 1935-36 would be more than 20.

However, it is clear that the earnings of the people have increased to some extent, although exact figures cannot be given now. If the same proportion of the annual expenditure to the earnings of the people, as was given in the table for 1919 to 1931 has been maintained, the earnings of the people in 1935 will amount to something between ¥13,700,000,000 and ¥14,900,000,000. This means that the expenditure in the general account is between 14 and 15 per cent. of the earnings of the people, which cannot be regarded as out of proportion.

As a matter of fact, however, individual incomes are always affected by the annual expenditure of the Government, which fact renders it impossible to decide whether the annual expenditure is in excess when compared with the earnings of the people.

During the sixteen years beginning in 1919 and ending in 1935, an annual increase of some ¥63,000,000 on the average was recorded in the expenditure, which is by no means abnormal as compared with the average increase of some ¥70,000,000 that was recorded during the nine years beginning in 1919 and ending in 1928 prior to the en-

Digitized by Google

forcement of the retrenchment policy.

That the annual expenditure increased suddenly following 1932 is to be regarded as a reaction against the sudden reduction amounting to some ¥340,000,000 that was made during the three years following 1929. In days of liberalism, it is normal for the public finance to increase or decrease along with private economy. Nations, however, found that reduction of public expenditure would aggravate the depression because of the decrease in private economy caused by the post-war depression, especially the world-wide depression following 1929. Therefore, retrenchment naturally changed into inflation. It follows that the budget for the fiscal year 1935-36 cannot be characterized as excessive or unsound simply because the total expenditure amounts to upwards of ¥2,000,000,000.

The question concerns the nature rather than the figures of the budget. The military expenses, which form about 46 per cent. of the total expenditure in the general account of the budget, certainly are not a small sum, but it should be borne in mind that Japan did not participate in the European War to such an extent as other European countries. In consequence, Japan missed the early opportunity to improve her aircraft and other weapons of war when the European countries spent enormous sums. Later, Japan kept pace with the world-wide tendency towards the reduction and limitation of armaments. Then changes in the international situation made Japan feel the necessity of replenishing her armaments. This fact, which accounts for the sudden increase of military expenses, should not be overlooked.

As Shinya Uchida, now Minister of Railways, pointed out during the sixty-fifth session of the Imperial Diet, when he was chairman of the budget committee of the House of Representatives, the appropriations required by the first and second naval replenishment programmes to make good the defects in national defence arising from the conclusion of the Washington and London naval treaties, amounted to upwards of ¥1,200,000,000, but the greater part of these appropriations accumulated after 1932. The special expenses of the Navy Ministry which amounted to ¥120,000,000 in the fiscal year 1929-30, were reduced to ¥88,000,000 in the fiscal year 1931-32 and then suddenly increased to ¥172,000,000 and to ¥288,000,000 in the two subsequent years.

After all, the military expenses in the budget, enormous as they are, have increased on account of the specific conditions as mentioned before and as such they will tend to decrease to a certain extent sooner or later. It also is to be observed that military expenses are decided by the international situation and the conditions of the relative armaments of the various countries. Since it is inevitable that each country will maintain sufficient armaments to guarantee security, the reduction of military expenses depends to a great extent upon co-operation between nations and the course of diplomacy in the future.

To leave the international side of the question, there is no gainsaying the fact that the budget has what are to be regarded as unsound factors, in that the increased expenditures benefit the heavy industries too much and the impoverished agricultural districts too little. This fact also explains the statement that the present situation is a "lame prosperity." The authorities of both the War Ministry and the Navy Ministry also are greatly concerned

Digitized by Google

in this connection and are working for wider distribution of the munitions industry, direct purchase of munitions and employment of youths from agricultural districts. Due to the nature of the industry, the direct contribution toward the prosperity of the agricultural districts is nevertheless comparatively small. What is regarded as a possible contribution by the Navy Ministry during the fiscal year 1934-35 towards remedying the situation are the enterprise fund amounting to ¥153,000,000, the cost of material amounting to ¥70,000,000. The budget for the same fiscal year also enables the War Ministry to contribute through its enterprise fund amounting to ¥119,000,000 and estimated costs of labour amounting to ¥32,500,000. But what proportion of these sums will be spent in the interests of rural districts? It is clear that the above-mentioned expenses of the Navy Ministry will benefit the heavy industrial circles directly. As for the expenses of the War Ministry, ¥22,808,000 is to be spent in the interests of the rural districts through the supply of rabbit fur, floss-silk (or silk-wadding), and horses as well as upon rice, wheat, fodder, cowhide and clothing materials. Of course, much of the money spent by the heavy industries profit rural districts indirectly in the form of wages. From the standpoint of maintaining the peasantry, however, subsidiary occupations of the farmers should be further encouraged. In short, greater efforts must be made in the future to harmonize military expenses and the economy of rural districts.

There are various measures that will help in the relief of rural districts, including the lowering of the costs of production, and encouragement of subsidiary occupations in addition to the promotion of export business, the munitions industry and public works. All these measures are being employed, but it is essential to see that the farmers are able to live by farming. For the realization of this purpose, the first thing to be done is to reduce or abolish various kinds of taxes, especially local taxes, for the farmers. For this purpose the Government will have to aid the local governments concerned or increase the allowance for compulsory education. An increase in the burdens of the urban consumers also will be unavoidable. In order to have the taxes in the agricultural districts reduced or abolished while increasing the burden of the urban consumers, it is necessary to effect a fundamental reform of the taxation system. Besides doing away with the practice of struggling for larger shares in the budget on the part of the various departments of the Government, it also will be necessary to effect a sweeping reform of the administrative organs.

When all the Powers concerned have perfected respective armaments in conformity with the actual conditions in their respective territories and avoided a useless race in armaments through the conclusion of an international agreement, the military expenses in the Japanese budget will gradually decrease and be restored to normal. It will then be easier to relieve the rural districts of their difficulties by means of farming or enterprises other than the munitions industry. It is earnestly hoped that such a day will not be long in coming.

Taxes and Duties

The land tax constituted the principal and largest tax of all during the feudal days of the Tokugawa Shogunate. The revenue then came direct from the tax on the territory under direct control of the Shogun, and that of provincial feudal clans was made independent of the Cen-

Digitized by Google

tral Government. Centralization of the country's financial system was the chief aim of the Meiji governments, and taxes were imposed by the Central Government to cover the whole country. The land tax was divided into two kinds, that is, payments in cash, and payments in produce such as rice and beans. Land certificates were issued by the Meiji Government in 1872 and in the following year the land tax act was revised and enforced. This brought about a very important and radical change in the payment of the land tax, for it was decreed that tax must be paid in money, payments in kind were abolished. The tax was fixed at 3/1,000 of the legal land value, or the value mentioned in land certificates. In 1875 the urban land tax was fixed at 3/100 of the legal land value. By a tax revision conducted in the same year nine kinds of taxes such as those on saké, soy, ships, cattle trading, silk, hunting, mining, oil pressing and ship anchoring were included in the national taxes and at the same time new taxes on patents, servant employment, carriages, rickshas, palanquins, horse riding, boat excursions, certificate stamps, business corporations, tobacco, weights and measurements and others were introduced. Miscellaneous taxes of the Tokugawa Shogunate numbering 1,553 were abolished. Estimates of tax revenue were formulated for the first time in 1875 and the amount for the year totalled ¥59,000,000, as follows:

TAX REVENUE

Land tax	¥50,345,327
Customs tax	1,718,732
Mine-lot tax	7,430
Government salary tax	92,625
Hokkaido marine products tax	342,526
Saké tax	2,555,594
Tobacco	206,748
Certificate stamp tax	498,228
Legal suit tax	63,714
Ship tax	128,514
Cart tax	213,192
Hunting tax	46,920
Cattle trading tax	90,833
Weights and measurements tax	2,019
Copyright tax	5,198
Open-port tax	2,774
Loochoo Clan's contribution	48,189
Capitalized pension and honours tax	2,075,118
Raw silk, stamp and other taxes	28,913
Ship anchorage tax	28,020
Total	59,194,031

Revision of Tax System The revision of the tax system of the Central Government was followed by a revision of that of the tax system of provincial governments, thereby drawing a clear line of distinction between the two kinds of taxes. It was announced that the provincial governments might levy a land tax, but this must not exceed 20 per cent. of the land tax of the Central Government. The customs duty of Japan originated in commercial treaties concluded by the Tokugawa Shogunate with Foreign Powers several years previous to the Meiji Restoration. Until 1898, the 30th year of Meiji, when the customs tariff was consolidated the regulations regarding customs duties were incomplete though they provided the second largest amount of income. Revenue from the land tax and customs duty for the first 10 years of Meiji was:

		Land tax	Customs revenue (In ¥1,000)
1st period		2,009,013	72,866
2nd	,,	3,355,965	502,807

1 Income Tax

The Income Tax Law, first instituted in 1887 under Imperial Ordinance, imposed a tax of from 1 to 3 per cent. on persons whose income from either property or business was ¥300 or more per annum. This law was subjected to a thorough revision in 1899 and was partially altered in 1901, 1905, 1913, and 1918. In 1920 it was subjected to a general revision, and was again revised thoroughly in 1926. The fundamental points are given in the following paragraphs :

Payers of the Tax Those coming under the following clauses are under obligation to pay the tax :—

(1) Those who have a domicile or have a temporary residence for one year or over within the territory where the Income Tax Law is in force.

(2) Those who, though not having a domicile or a temporary residence for one year or over within the territory where the Income Tax Law is in force, derive income coming under any of the following items :

(a) When having assets or doing business within the territory where the Law is in force ;

(b) When interest on public bonds, debentures, or fixed deposits in banks or deposits of a corresponding nature is received in payment within the territory where the Law is in force ;

(c) When receiving from a corporation having a head office or a principal office within the territory where the Law is in force profit, dividend, a share of "excess or surplus income," or bonus incidental to the disposition of the profit or the "excess or surplus income," or gratuitous payment corresponding to such bonus.

The Law is applicable only to Japan proper and is not in force in Chosen, Taiwan and Karafuto. Even in Japan proper, the Ogasawara Islands and the seven islands of Izu are exempted for the present from the operation of this Law.

Classification of Incomes The Income Tax is assessed on the following classes of incomes :

Class I

A. Ordinary income of a Corporation. The balance remaining in each accounting period after deducting the gross losses from the gross profits for the said period.

B. Excess profits of a Corporation. When the ordinary income of a corporation for any accounting period exceeds 10% of the average net assets at the end of each month in the said period, that is to say, the average amount of paid-up capital and reserves, any excess over 10% is taxed.

C. Net assets of Corporations at liquidation or amalgamation. In the case of dissolution of a corporation, an excess of the value of remaining assets over the paid-up capital or the invested fund at the time of dissolution ; in the case of amalgamation of corporations, an excess of the sum of the paid-up amount for shares and the amount of money, acquired by the shareholders or partners of the amalgamated corporations from the amalgamating corporations or a corporation created as the result of the amalgamation, over the paid-up capital or the invested fund of the amalgamated corporations at the time of amalgamation.

D. Undivided profits of a Family Corporation. Undivided profits in each accounting period of a family corporation, i. e., a corporation with half or more of its capital or invested fund consisting of shares owned by a shareholder or a partner and those who have special relations with

Digitized by Google

the said shareholder or partner such as his relatives or his employees, provided that such undivided amount comes under either of the following clauses (when there is a conflict between them the one that concerns the greater amount is applied); and the Government decides all questions relating to the scope of the application of these provisions.

(1) Amount retained out of the ordinary income of each accounting period in excess of 3/10 of the ordinary income of the said period.

(2) The sum total of the reserves at the end of each accounting period and the amount retained out of the ordinary income of the said period, exceeding one-half of the amount of the paid-up shares of capital or the invested fund; but that part of the reserves at the end of such accounting period which exceeds one-half of the paid-up shares of capital or the invested fund is deducted from the said total.

E. Income of a Corporation without head office or principal business office in the territory where the Income Tax Law is in force. Income derived from assets owned or business done within the territory where this law is operative by a corporation whose head office or principal business office is not situated within such territory.

Class II

A. Interest on public bonds, debentures, fixed bank deposits, or bank deposits of similar nature receivable in places where the Law is in force. This applies also to profit on trust funds employed in loans by a trust company.

B. Distribution of profit or dividends, distribution of surplus money, or bonuses given by way of distributing profits or surplus money or allowances similar in nature to bonuses, as received by those who have neither domicile nor residence for one year or more in places where the Law is operative from corporations maintaining head or principal business offices in places where the Law is operative.

In the foregoing two cases, the amount received shall constitute the assessable income.

Class III

Incomes of individuals not coming under Class II are calculated as follows:

(1) Interest on loans made on a non-business basis and interest on public bonds, debentures and deposits that do not come under Class II—calculated on receipts during the preceding year;

(2) Income from forests—on gross receipts during the preceding year less the necessary disbursements made;

(3) Bonuses or allowances similar in nature to bonuses—receipts during the period between March 1 of the preceding year and the last day of February of that year;

(4) The distribution of interest or profit, or allotments of surplus received from a corporation—receipts during the period between March 1 of the preceding year and the last day of February of that year (in the case of dividends on unregistered shares the actual amount received) less 4/10;

(5) Salaries, allowances, annuities, pensions, retiring pensions and other allowances of a similar nature—actual receipts during the preceding year when such incomes have been received continuously from January 1 of the year, or estimated annual receipts when such incomes have not been received continuously from January 1 of the preceding year;

(6) Incomes other than those enumerated above—gross receipts of

Digitized by Google

the preceding year less the necessary disbursements made when such incomes have been received from January 1 of the year, or estimated annual receipts when such incomes have been derived from properties, business or professions that have not been practised continuously from January 1 of the preceding year.

When the sum received as repayment from a corporation in consequence of the redemption of shares or in the case of one's retirement from a partnership exceeds the sum actually paid for the said shares or the contribution actually made by the retiring partner, such excess shall be regarded as a dividend of profits from the said corporation.

The following may be deducted as necessary expenses in calculating the assessable incomes of Class III:

Prices paid or expenses incurred in purchasing seeds, silk-worm eggs, manure, feeds for cattle or others, merchandise laid in as stock, raw materials, repair of ground or things, rent, public levy on ground and things or as paid incidental to conducting business, salaries and allowances to employees, and all other necessary disbursements incurred for procuring the incomes. Household and incidental expenses are not to be deducted.

(7) The following revision has been made in this tax:

(a) As regards incomes accruing from trust property, the tax is levied upon the beneficiary considering him as an owner of the trust property.

(b) In case the beneficiary is not specified or not yet in being, the trustee shall be deemed to be the beneficiary and taxed accordingly.

Non-taxable or Free Incomes are non-taxable or free according to the provisions of the Income Tax Law or to provisions of other laws.

Those exempted from taxation by the Income Tax Law are as follows:

Hokkaido, fu and ken (Prefectures), cities, towns, villages, other public corporations specified by an Order, Shinto and Buddhist temples, and associations incorporated in accordance with Article 34[1] of the Civil Code are exempted from Income Tax. The public corporations specified by the Order as mentioned above are as follows:

Unions of fu and ken (Prefectures); unions of cities, towns and villages; unions of towns and villages; wards or property-owning sections of cities, towns or villages; Hokkaido Local Expenditure; school unions of cities, towns and villages; school districts of cities, towns or villages; irrigation associations; federations of irrigation associations; farms readjustment associations; federations of farms readjustment associations; Hokkaido public works associations; staple commodities producers' associations; federations of staple commodities producers' associations; forestry associations; saké brewers' associations; federations of saké brewers' associations; marine products associations; federations of marine products associations; foreign waters marine products associations; federations of foreign waters marine products associations; stock-breeders' associations; federations of stock-breeders' associations; agricultural associations; chambers of commerce and other public corporations of a corresponding nature. Also, those public corporations in Chosen, Taiwan, Kwanto-shu (Kwantung Province) and Karafuto, which are exempted from income tax by laws or orders of the respective regions.

1 Judicial persons regarding Shinto religion, other religious sects, charity, science, art and others for public good, organized under sanction of the Minister concerned.

Digitized by Google

Class III incomes coming under any of the following items are exempted from taxation:

(1) Salaries and allowances of officers and privates of the Army and Navy while engaged in war;

(2) Allowances to widows and orphans and pensions to the sick and wounded;

(3) Money received for travelling or school expenses and legal allowances received for support;

(4) Interest on deposits in the postal savings bank, industrial associations and savings banks;

(5) Occasional incomes derived from undertakings not conducted for profit;

(6) Incomes of aliens as derived from trade, business or profession in places where the Income Tax Law is not in force.

Those who manufacture certain staple commodities that are specified by Imperial Orders are exempted, in accordance with provisions of an Order, from the income tax on the income derived from such manufacturing for the first four years of operation of a factory.

Those exempted from taxation by laws or regulations other than the Income Tax Law:

Persons or corporations exempted from the Tax are:

(1) Industrial associations, federations of industrial associations, the Central League of Industrial Associations, and their federations (Art. 6, Industrial Association Law).

(2) Fishers' associations; federations of fishers' associations (Art. 45, Fishery Law).

(3) Persons engaged in the agricultural warehousing business (Art. 14, Agricultural Warehousing Law).

(4) A corporation with head office or principal business office in Chosen (Korea), Taiwan (Formosa) or Kwanto-shū (Kwantung Province) (Art. 12, Law No. XII, 1920).

(5) Central Chest for Industrial Associations in Japan (Art. 8, Central Chest for Industrial Associations Law).

(6) Housing associations (Art. 16, Housing Associations Law).

(7) Exporters' associations (Art. 33, Exporters' Associations Law).

(8) Associations of producers of staple articles of export and federations of associations of producers of staple articles of export (Art. 38, Associations of Producers of Staple Articles of Export Law).

Items exempted from the Tax are:

(1) Interest on National Bonds (Law No. VII, 1909).

(2) Interest on Savings Bonds (Law No. XIX, 1905).

(3) Money or gifts in kind received in accordance with the Military Relief Law (Art. 17, Military Relief Law).

(4) Income derived from the iron foundry business as specified in the Iron Foundry Encouragement Law (details mentioned in the said Law and the rules pertaining to it).

(5) Incomes derived from industries producing certain important goods specified in the Imperial Ordinance; but such exemption is allowed for the first four years only of operation of a factory (Art. 19, Income Tax Law).

(6) Incomes derived from certain industries in colonies where such industries are exempted from the imposition of the income tax (Art. 7, Law No. XII. 1920).

(7) Interest on Reconstruction Savings Certificates (Art. 6, Reconstruction Savings Certificates Law).

Abatement from Incomes

A. Abatement from incomes from service.

Assessable incomes as under Class III are determined after making abatement at the under-mentioned

Digitized by Google

rates from the earned incomes, i.e. salaries, wages, allowances, annuities, pensions, retirement allowances, bonuses and allowances of similar nature to a bonus;

(1) When the total income under Class III is less than ¥6,000 —2/10 of the income earned by personal service.

(2) When the total income under Class III is less than ¥12,000 provided that the unearned portion exceeds ¥6,000—1/10 of the earned income.

(3) When the total income under Class III is less than ¥12,000 provided that the unearned portion is under ¥6,000—2/10 of that part of the earned income which, if added to the unearned income, amounts to ¥6,000; and 1/10 of the other part of the earned income.

B. Special abatement for aged or juvenile members of the family and disabled or invalid dependants.

Those whose total income is below ¥3,000 (after making deductions as provided for in A in the case of the earned incomes) are allowed abatement at the rate of ¥100 per capita upon their application, if, on March 1st of the year, the head or any members of the family are under 18 years or over 60 or disabled or invalid. The amount remaining after this abatement is made is their assessable income.

C. Abatement of life insurance premium.

Premium paid on a life-policy by a person for the benefit of himself, his family or heir may be deducted in accordance with the Order and on his own application within the limit of ¥200 a year.

Minimum Liable to Taxation

A. Class I and II. All income is taxed.

B. Class III. Income under Class III not exceeding ¥1,200 is exempted from taxation, as is also income when the taxable portion is made less than ¥1,200 as a result of abatements made for the earned income, certain family dependants and life insurance premiums.

Tax Rates

Class I

A. Ordinary income of a Corporation.

A corporation that has its head office or principal business office within the territory where the Income Tax Law is enforced.....5%

B. Excess profits of a Corporation.

Excess profits of a corporation are divided into three classes with a separate rate for each class:

That portion of the income in excess of 10% and under 20% of the capital.....4%

That portion of the income in excess of 20% and under 30% of the capital 4%

That portion of the income in excess of 30% of the capital 20%

C. Net assets of Corporations at liquidation or amalgamation.

Net assets of corporations at liquidation or amalgamation are divided into two classes with separate rates:

The total of reserves and income exempted by law from the income tax 5%

Others 10%

D. Undivided profits of a Family Corporation.

In fixing the rate of the tax, an annual income is calculated on the basis of ordinary income of the accounting period. To 10% of the portion under ¥50,000 of such annual income is added, 15% of the portion from ¥50,000 to ¥100,000, 20% of the portion from ¥100,000 to ¥500,000, 25% of the portion from ¥500,000 to ¥1,000,000, and 30% of the portion in excess of ¥1,000,000; and the percentage that the total

Digitized by Google

bears to the ordinary income is the rate of the tax.

E. Income of a Corporation having no head office or principal business office in the territory where the Income Tax Law is in force....10%

Class II

A Interest on public bonds..4%
Other interest 5%
B Profits on dividends.....7%

Class III

Income under this class is divided into the following categories and the progressive rates are applied to the respective categories; but income from forests is assessed separately by multiplying the amount obtained by applying the following rates to one-fifth of such income by five.

Income not exceeding	¥ 1,200	0.8 %
Income exceeding	1,200	2
" "	1,500	3
" "	2,000	4
" "	3,000	5
" "	5,000	6.5
" "	7,000	8
" "	10,000	9.5
" "	15,000	11
" "	20,000	13
" "	30,000	15
" "	50,000	17
" "	70,000	19
" "	100,000	21
" "	200,000	23
" "	500,000	25
" "	1,000,000	27
" "	2,000,000	30
" "	3,000,000	33
" "	4,000,000	36

The tax for the head and each of the other members or inmates of the family living together, if any, is determined by applying the rates to the total of their incomes and then working out the amount thus obtained in proportion to their respective incomes.

The above provision applies also to the incomes of two or more than two members of the family living together but not with the head.

Prevention of Double Taxation In order to avoid double taxation in Class I and Class II income tax, there is a provision which allows the deduction of the amount of the Class II income tax paid by a corporation for each accounting period from the amount of the Class I income tax for the same period and this provision is applied in the same way to the net assets of corporations at liquidation or amalgamation.

Time of Payment

Class I

Income tax under this class is collected at the end of every accounting period. The tax on the income at liquidation or amalgamation is collected when the liquidation or amalgamation has been effected.

Class II

The tax is collected by the payer of the money coming under this class at the time of its payment, and he in turn transmits the tax to the Government by the 10th of the ensuing month.

Class III

Income tax under this class is divided into four equal parts which are paid respectively at the following four periods:

1st period	Between July 1 and 30 of the current year
2nd "	" October 1 " 30 " " " "
3rd "	" January 1 " 31 of the following year
4th "	" March 1 " 31 " " " "

Protests and Petitions

(1) Inquiries. In case a person liable to taxation has any objection regarding his taxable income as notified by the Government, he may within twenty days from the notification apply in writing for an inquiry to the Revenue Superintendent

Digitized by Google

through the Chief of the Taxation Office, stating the points of objection and attaching documentary evidence.

When the aforesaid application is submitted, the Government gives judgment according to the decision reached by the Committee of Inquiry on Incomes consisting of three tax collectors appointed by the Minister of Finance and those who have been elected by mutual vote from among the members of Incomes Investigation Committees in the prefectures or Hokkaido within the jurisdiction of the Revenue Superintendence Office, one for each prefecture and four for Hokkaido.

(2) Decrease against estimated income. When the actual income of a person liable under paragraphs 5 and 6 of Class III decreases by more than one-half of the estimate, he may apply to the Government for a revision of the amount of his income, but such application should be made before January 31 of the ensuing year. This provision, however, is not applied to decreases brought about by succession, donations or continuation of a business after the amount of income has been determined by the Government.

(3) Petition and suit in the Court of Administrative Litigation. A person who is dissatisfied with the decision of the Committee of Inquiry on Incomes or the revision as defined in the foregoing provision may file a petition or bring a suit in the Court of Administrative Litigation.

Taxation as regards National and Local Loans In the following cases the interest on the bonds, whether domestic or foreign, is exempted from taxation:

(1) When the Japanese national bonds issued abroad are owned by foreigners;

(2) When domestic Japanese national bonds are owned by foreigners;

(3) When the Japanese national bonds issued abroad are imported into Japan.

In the following cases the interest received within the territory where the Law is in force is taxable:

(1) When the Japanese local bonds issued abroad are imported into Japan;

(2) When domestic Japanese local bonds are owned by foreigners.

Exemption on the Profits from Foreign Shipping A foreign person or foreign corporation who has no domicile in this country is exempted from income tax on the profits from shipping of a foreign nationality, provided that the country, to which such shipping belongs, extends similar exemption to the profits of Japanese shipping.

With respect to a reciprocal exemption from income tax on the profits of shipping, agreements were made with the following countries:

United States of America	June 8, 1926
Denmark	October 15, 1927
United Kingdom of Great Britain and Northern Ireland	August 10, 1929
Canada	September 21, 1929
France	May 5, 1931
Norway	December 23, 1931
Netherlands	February 8, 1933
Brazil	May 9, 1933

2 Land Tax

The land tax has hitherto been levied on the basis of the assessment of 1873. In view, however, of the fact that after that year there was only a partial revision in the assessed value which, with the progress

Digitized by Google

of economic conditions, became unadapted to actual circumstances and in many cases caused unfairness in the incidence of taxation, fundamental amendments were effected in 1930 in this tax, whereby the rental value was taken as the basis of tax assessment. At the same time, part of the surplus revenue arising out of the conclusion of the London Naval Treaty was devoted to the reduction of this tax.

Basis of Assessment The land tax is imposed on the basis of the rental value of land entered in the cadastre. From 1930 to 1937, it is to be levied according to the rental value assessed during the two years 1926 and 1927, but after that period it will be levied according to a rental value to be amended every ten years. The first amendment will be made in 1938.

Payers of Tax All landowners are liable for this tax. In the case of land under mortgage, however, the tax is collected from the mortgagee; and in the case of land under superficies of more than one hundred years, it is collected from the superficiary.

Rates of Tax Formerly, the land tax was imposed according to the value of land, and the rates were 2.5% on residential land, 4.5% on rice and other fields and 5.5% on other lands. With the amendment of this tax by which the rental value was taken as the basis of tax assessment, however, the tax is levied on all categories of land at the rate of 3.8% with the exception of 4% in 1931.

Tax Reduction and Exemption Reduction is made for a fixed period in the case of developed land (land sold or transferred by the Government under an agreement previously made to the effect that, after the completion of its clearing, it should be sold or transferred in accordance with Art. XXI, State Property Law, and become taxable land), land under cultivation (land converted from waste, forests, etc., into rice-fields, lots for building purposes, etc.) and land the classification of which was interchanged. Reclaimed land, waste land and land damaged by calamities are exempt from the tax. There is also a regulation providing that petty independent farmers owning rice or other fields within the city, town or village where they are domiciled or within the neighbouring cities, towns or villages, should be exempt from the land tax in cases where the rental value of rice or other fields is under ₹200, including that of the fields owned by other members of their families. The rice or other fields tenanted are, however, not exempted from the land tax.

3 Business Profits Tax

The business tax of 1896 was based upon external valuation of a business and the tax burden was not necessarily borne by tax-payers in proportion to their ability. In order to remedy this inequality, the business tax law was thoroughly revised and the Business Profits Tax Law, enacted for the purpose of imposing a tax on the net profits of a business, was promulgated in March, 1926 and put into effect on and after January 1, 1927. The important points of this law are given below:

(1) Persons liable to the Business Profits Tax.

A A commercial corporation with head office, branch office or any business office in the territory where the Business Profits Tax Law is in force.

B A person who engages in any of the following businesses in the territory where the Business Profits Tax Law is in force:

Digitized by Google

(1) Sale of goods,
(2) Banking,
(3) Mutual loan business (Mujin),
(4) Money-lending,
(5) Renting of goods,
(6) Manufacturing (including the generating and supplying of gas and electricity, and the repairing of articles),
(7) Transportation (including transportation agencies),
(8) Warehousing,
(9) Contracting,
(10) Printing,
(11) Publishing,
(12) Photography,
(13) Renting assembly rooms,
(14) Inn-keeping (including boarding-house keeping, but excluding doss-house keeping),
(15) Restaurant keeping,
(16) Commission agency (in transactions outside of what are defined as commercial transactions by the Commercial Law),
(17) Representation (of merchants in the transaction of regular business),
(18) Commission agency (in commercial transactions defined by the Commercial Law),
(19) Commission business.

Basis of Assessment The tax is assessed on net profits, viz., in the case of a corporation, the balance remaining in each accounting period after deducting the total losses from the gross profits for the period and, in the case of an individual, the balance remaining after deducting necessary expenses from the gross profits for the preceding year.

General and Temporary Exemption

(a) No business profits tax is levied on the profits of the following businesses:

(1) Dealing in postage and revenue stamps issued by the Government;

(2) Manufacture, repairing and sale of scales, weights and measures;

(3) Sale of minerals mined or extracted by the seller himself;

(4) Publishing under the Newspaper Law;

(5) Business transacted in offices outside of the territory where the Business Profits Tax Law is in force;

(6) Theatrical performances and fisheries when conducted by a corporation;

(7) Sale of, or manufacturing processes carried out on products of agriculture, forestry, live-stock breeding or marine industries; but such sale or manufacture in a place specially prepared for the purpose is not exempted.

(b) Net profits derived from industries producing certain important goods specified by the Imperial Ordinance are exempt from the business profits tax under the provisions of the Ordinance during the first four years of operation of a factory.

Minimum Net Profits Assessable The minimum net profits assessable are ¥400 in the case of an individual, but there is no such exemption in the case of a corporation. The rate of the tax follows:

Corporation	3.4 %
Individual	
Less than ¥1,000 of net profit	2.2 %
Exceeding ¥1,000 of net profit	
Fractions less than ¥1,000	2.2 %
Fractions exceeding ¥1,000	2.6 %

The tax has hitherto been levied at the rate of 3.6% on corporation and 2.8% on individuals, but a part of the surplus revenue arising out of the London Naval Treaty was, as previously mentioned, used to reduce the rates. For corporations this reduction was effective from the business year ending on and after April 1, 1932, and for individuals from 1931. The rate for individuals was, however, in 1931 only 2.5% for

Digitized by Google

fractions less than ₹1,000 and 2.8% for those exceeding ₹1,000.

Prevention of Double Taxation In order to avoid the double imposition of supplementary direct national taxes,

(a) in the case of a corporation, the amount of the land tax or the capital interest tax paid by a corporation for each accounting period is deducted from the amount of the business profits tax assessable on the profits of such a corporation for the said period;

(b) in the case of an individual, the amount of the capital interest liable to the capital interest tax is deducted from the net profits in calculating the basis of the business profits tax, while the amount of the land tax that has been paid on the land used for the business is also deducted from the amount of the business profits tax assessed on the net profits of the business.

Time of Payment In the case of a corporation, the tax is to be paid at the end of each accounting period and semi-annually in the case of an individual.

The first payment is to be made between the 1st and the 31st of August of the year and the second between the 1st and the 30th of November.

Exemption of Foreign Shipping Provided their country extends similar exemption to Japanese shipping, foreigners or foreign corporations having no legal domicile in Japan are, after May 11, 1928, not only exempt from the income tax but also from the business profits tax on the earning and profits of their foreign owned shipping. The agreements mentioned above in Section II, of Income Tax, regulate the exemptions from this tax also.

Extraordinary Business Profit Tax (Imperial Ordinance No. 37 issued on March 29, 1935) See "A Survey on the Budget for 1935-36, p. 283.

4 Capital Interest Tax

The capital interest tax was put into force on April 1, 1926, with a view to supplementing, together with the land tax, the business profits tax and the income tax, Japan's primary direct national tax. Thus, one of the defects of our system of taxation, viz., the unfair distribution of the burden of taxation between income from invested capital and that from personal service, has been eliminated. The important points are as follows:

Persons liable to the capital interest tax are the receivers of interest on capital in the territory where the capital interest tax law is in force.

Basis of Assessment

Class A

Interest on public bonds, on debentures issued by ordinary business corporations or the Central Chest for Industrial Associations in Japan, or on bank deposits; or profits from trust funds employed in loans by a trust company.

Class B

Interest on loans made on a non-business basis or on deposits as classified among the incomes under Class III, received during the previous year by a person liable to pay tax on income under Class III; and in this case the income of a former owner is considered to be that of his heir.

Exemption from Taxation No capital interest tax is levied on the following capital interest under Class A:

(1) Interest received by persons exempted from Class II income tax under the provisions of the Income Tax Law, etc.

(2) Interest on Savings Bonds

Digitized by Google

or the Reconstruction Savings Certificates.

The rate of the tax is 2% of the amount of capital interest and the time of payment is :

For the capital interest under Class A :
At the time of payment of such interest.
For the capital interest under Class B :
Semi-annually, viz., the first payment between the 1st and 31st of August and the second payment between the 1st and 30th of November.

5 Succession Tax

The Succession Tax Law was promulgated in January, 1905, and put into operation on April 1st of the same year. Since then it has been revised several times, the last revision being undertaken in April, 1926. According to this law, when a succession occurs, irrespective of the question whether the place of its occurrence lies within or without the Empire, or whether the predecessor or the heir is or is not a Japanese subject, the tax is imposed upon the descendible property which lies in a place where the aforesaid law is in force. But the kind of descendible property subject to the succession tax and the method of valuation of the property differ according as the predecessor has or has not a domicile in a place where the said law is in force.

The following are taken as descendible property subject to this tax :

A When the predecessor is domiciled in a place where the said law is in force :

(1) Movable or immovable property in a place where the said law is in force ;

(2) Rights existing in respect of immovable property in a place where the said law is in force ;

(3) Property-rights other than those specified in the foregoing two items.

B When the predecessor is not domiciled in a place where the said law is in force :

(1) Movable or immovable property in a place where the said law is in force ;

(2) Rights existing in respect of immovable property in a place where the said law is in force.

Exemption In the following cases the property is exempted from the succession tax :

(1) The value of a property which does not amount to ¥5,000 in the case of succession to the headship of a house is not subject to the succession tax ;

(2) The value of a property which does not amount to ¥1,000 in the case of succession to property is not subject to the succession tax ;

(3) When a succession occurs through death in a battle, or through death caused by wounds or sickness incurred in a battle, of officers and privates of the Army or Navy and others attached thereto, the property of the deceased is not subject to the succession tax ;

(4) When a succession occurs again within five years to the property upon which the tax has been imposed, the amount of succession tax corresponding to the amount of tax previously collected is remitted ;

(5) When a succession occurs again within seven years to the property upon which the tax has been imposed, half the amount of succession tax corresponding to the amount of tax previously collected is remitted.

The Rate The succession tax is, after the value of assessment has been classified, imposed by applying the proper rate of tax in the proper degree in each case according to the kinds of successors.

The tax-rates vary, in the case of succession to the headship of a family, from 0.5% to 16% and in the case of succession to property,

Digitized by Google

from 1% to 21%, according to the amount of the property and to the kind of successors.

The lowest rate is applied to an estate under ¥5,000 in the case of succession to the headship of a family and to a legacy under ¥1,000 in the case of succession to a property, while the highest rate is applied to that portion of an estate or legacy exceeding ¥5,000,000.

With respect to successions occurring in accordance with the laws of a foreign country the tax-rates of the succession to property shall correspondingly apply.

When a donation, over ¥1,000 in value, of other properties than real estate within the territory where this law is in force or vested, is made in the following cases, it is considered to be a legacy and the succession tax applies:

(1) On donations to relatives.

(2) On donations made by the head or a member of the main family to the head or a member of a branch family at or after the time of setting up such branch family.

The Revision The following revision has been made in this tax:

(1) When a creator of a trust causes another person to possess the right to get the benefit accruing from the trust, that right shall be deemed to have been given or bequeathed at the time of such transfer, and the new possessor shall be taxed in conformity with the provisions of the Succession Tax Law.

(2) When, in the case stipulated in the preceding paragraph, a beneficiary is not specified or does not exist at the time of creation of the trust, a direct descendant of the creator of the trust is considered to be the beneficiary and the trustee to be an administrator.

(3) The right to receive the benefit from a trust shall be appraised by the Government at its discretion.

6 Tax on Liquors

Tax on Saké According to the law now in force, the tax is imposed upon persons brewing saké, which is divided into five classes, namely, Seishu (refined saké), Dakushu (unrefined or muddy saké), Shirozaké (white saké), Mirin (sweet saké) and Shóchu (distilled saké).

The tax is levied at the following rates for the year commencing on the 1st of October and ending on the 30th of the following September:

1st kind	Dakushu containing not more than 23° of alcohol	36 yen per koku
2nd kind	Seishu and Shirozaké containing not more than 23° of alcohol; Mirin and Shochu containing not more than 30° of alcohol	40 yen per koku
3rd kind	Shochu containing more than 30° and not more than 45° of alcohol	1.50 yen per koku for each additional 1° over the rate for the 2nd kind, i.e., 40 yen
4th kind	Seishu, Dakushu and Shirozaké containing more than 23° of alcohol; Mirin containing more than 30° of alcohol; Shochu containing more than 45° of alcohol	1.80 yen per koku for each 1° of alcohol

By the quantity of alcohol in the above table is meant the percentage of alcohol with a specific gravity of 0.7947, contained in the original fluid at the temperature of 15° C. (59° F.).

The number of koku of saké and the basis of assessment are inspected and assessed when the brewing is finished.

Beer Tax The beer tax, created in 1901, is levied upon brewers of beer at the rate of 25 yen per koku on the quantity brewed.

Digitized by Google

Tax on Alcohol and Alcoholic Liquors Upon revision of the saké tax in 1901, the tax on alcohol and alcoholic liquors was separated from the saké tax. It is imposed upon alcohol and alcoholic liquors, except those subject to saké or beer tax, and wine at the rate of 1.80 yen for each per cent. of pure alcohol contained in 1 koku of the original fluid. In no case, however, may the rate of the tax fall below 42 yen per koku.

No tax is levied upon wine or other alcoholic liquors made from fruits of any kind.

7 Sugar Excise

Sugar excise, introduced in 1901, is imposed in respect of sugar, molasses and syrups, which are taken delivery of from manufactories, custom-house compounds, bonded warehouses, customs temporary depots and in other places where the storage of foreign goods is permitted by laws and ordinances, for the purpose of domestic consumption. The rates vary from ¥0.9 to ¥9.5 per picul according to the kinds of articles. As a part of the surplus revenue realized by the conclusion of the London Naval Treaty was applied to the reduction of this tax, the former rates which were from ¥1 to ¥10 were thus reduced. These rates are effective from January 1, 1932.

8 Table Water Tax

The table water tax was established in April, 1926, and is levied on the consumption of all kinds of aerated drinks like "citron" or soda water, except those that contain less carbonic acid gas than 5/10,000 of the gross weight, or those that contain more alcohol than 1% of the gross weight. Manufacturers of aerated water are liable to pay the tax.

The rates of the tax are as follows:

Class I Tama-ramuné (Aerated water sold in bottles with round glass stoppers suitable for permanent use).. .. .. .. ¥7 per 1 koku.

Class II Aerated water sold in bottles other than those mentioned above.. .. .. .. ¥10 per 1 koku.

Class III Aerated water sold in receptacles other than bottles .. .. 3 yen per 1 kilogramme of carbonic acid gas used.

The tax is ordinarily collected at the time of dispatch of the goods, the manufacturers furnish declarations as to quantities and the Government uses these as the basis of calculating the amount of tax payable; the tax of the preceding month is due by the end of the next month.

9 Mining Tax

The mining tax is imposed upon persons holding mining rights under the Mining Law of 1905. The rates of the tax are as follows:

I Tax on mining sets:

(a) 30 sen for each 1,000 tsubo per annum in the case of prospecting.

(b) 60 sen for each 1,000 tsubo per annum in the case of mining.

II Tax on mining products:

1 per cent. of the value of products (gold, silver, lead and iron ores are exempted from this tax).

10 Placer Tax

The placer tax is imposed upon persons engaged in recovering gold-dust. The rates of the tax are as follows:

Alluvial .. .. 30 sen per annum per cho of placer area.

Non-alluvial .. .. .. 30 sen per annum per 1,000 tsubo of placer area.

11 Tax on Bourses

The tax on bourses has hitherto been levied upon bourses according to the amount of transactions carried on in such bourses; but in the revised tax law which came into force in September, 1914, this tax is subdivided into the bourse business tax and bourse tax.

The bourse business tax is levied upon bourses unless they are organized as corporations, at the rate of 15 per cent. of the total sale commissions received by such bourses.

With the revision in April, 1922 of the Bourse Law, the bourse tax was revised as follows:

(1) In respect of marginal bargains carried on at a bourse the bourse tax is levied at the following rates according to the amount of the transaction:

Class I Local loans and company debentures.

A Bargains to be settled within the limit of 7 days 0.6/10,000

B Others 1/10,000

Class II Negotiable paper.

A Bargains to be settled within the limit of 7 days 1.5/10,000

B Others 2.5/10,000

Class III Merchandise 2.5/10,000

(2) Bargains cancelled are not exempt from the tax.

12 Tax on the Issue of Bank Notes

A tax has hitherto been imposed on the issue of convertible bank notes against Government bonds and other specific securities. In June, 1932, however, amendments were made in the Convertible Bank Note Regulations, whereby both the issue against the securities up to the legal limit of ¥1,000,000,000 and the additional issue over this limit which is not to continue beyond fifteen days have been exempt from the payment of the tax during and after the second half of 1932. Instead of the payment of the tax formerly imposed, a system of payments to the Government by the Bank of Japan has been newly created. For the system of payments to the Government and the tax on the additional issue over the legal limit which is to continue beyond fifteen days, see note on the Bank of Japan in Chapter IX.

13 Textiles Consumption Tax

The textiles consumption tax established in 1905 is levied at the rate of 9 per cent. of the value upon persons taking delivery, at the time of such delivery, of textiles from factories, custom-house compounds, bonded warehouses, temporary customs depots and other places where the storage of foreign goods is permitted by laws and ordinances. Formerly the tax was levied at the rate of 10%, but a part of the surplus revenue realized by the conclusion of the London Naval Treaty was applied to reduce the rate to 9%. Cotton fabrics and other fabrics of low grade defined by law are exempt from the tax.

The above amendment has been effective since December 1, 1931.

14 Tonnage Dues

Tonnage dues were introduced in 1899. Vessels entering a Japanese port from a foreign country must pay tonnage dues of 7 sen per registered ton or per ten koku of actual capacity; but by the payment of 21 sen per registered ton or per ten koku, they are for one year exempt from all further tonnage dues at that port.

15 Customs Duties

This subject is dealt with in the Chapter on Foreign Trade to which the reader is referred.

Stamp Receipts

Taxes and fees belonging to this category at present exceed fourscore, chief among them are: the registration tax, stamp duties on legal documents, playing cards tax, shooting license tax, civil suit stamps, examination fees, and charges and dues levied according to the customs law and other regulations connected therewith. Of these, the registration tax is levied, by means of adhesive stamps, on the registration of real estate, ships, the mass of mortgage properties, commerce, lawyers, doctors, veterinary surgeons, mariners, copyrights, industrial patents, mining rights, alluvial mineral rights and fishery rights; and such registrations are charged either with an ad valorem or a fixed duty. The stamp duty is imposed, by means of adhesive or embossed stamps, upon legal documents and books certifying the acquisition, forfeiture and transfer of property, and a graduated or fixed duty applies thereto.

The registration tax was, however, revised by Law No. 63 promulgated on April 24, 1929, and it was decided that the registration of the premises of foreign embassies, legations and consulates in Japan should, upon condition of reciprocal agreements, be exempt from the registration tax.

Receipts from Government Enterprises

1 Tobacco Monopoly

In 1876 the Tobacco Regulations were for the first time promulgated and a tax was levied on tobacco; but in 1898 this tax was abolished and the Leaf-Tobacco Monopoly Law was put into operation. In 1904 with a view to enforcing stricter control by introduction of a complete monopoly system on the one hand and from considerations of financial requirements on the other, the Leaf-Tobacco Monopoly Law was replaced by the Manufactured Tobacco Monopoly Law, which is the law still in force. According to the provisions of this law, the cultivation of leaf-tobacco is permitted to private individuals who have obtained the permission of the Government therefor; the leaf-tobacco gathered by them is taken over by the Government and payment is made according to quantity and quality; it is manufactured at Government factories and the manufactured article is sold at fixed prices by dealers licensed by the Government. Foreign tobacco cannot be imported except by the Government or persons appointed for the purpose by the Government, while tobacco can be exported only by persons who have been specially permitted to do so by the Government.

The wholesale tobacco business was placed under the direct management of the Government on and after July 1, 1931.

2 Salt Monopoly

The Government, from considerations of financial requirements and of the salt supply, issued the Salt Monopoly Law in January, 1905, which came into operation in June of the same year. According to the provisions of this law, salt can only be manufactured by persons licensed by the Government and all salt produced is taken over by the Government at prices varying with its quality. Formerly, the price at which the Government sold it was the cost price plus a fixed rate of profit and

Digitized by Google

expenses, but as referred to below, no profit is at present added in arriving at the selling price. Salt is sold only by persons licensed by the Government. Foreign and Taiwan salt cannot be imported except by the Government or persons appointed for the purpose by the Government, while for the purpose of exportation, salt is sold by the Government at a specially reduced price and can be exported by anybody. Salt intended for use in industry, agriculture, mining and fishery of some kind receives special treatment and is sold at a specially reduced price. A considerable amount of profit was annually obtained from the salt monopoly up to the financial year 1917-18, but, in and after the financial year 1918-19, the idea of realizing profit was done away with from the view-point of social policy. Further, with a view to controlling the overproduction of salt resulting from the improvement in salt manufacture in Japan proper and the colonies and reducing the salt price, the Government promulgated in April, 1929 the Law regarding the Adjustment of Salt-fields. Thus it prohibited some domestic salt producers from manufacturing salt on two occasions during 1929 and 1930.

3 Camphor Monopoly

The Camphor Monopoly Law was first put into force in Formosa only; but the Government issued in June, 1903, and carried into effect in October of the same year, the Crude Camphor and Camphor Oil Monopoly Law to be operative both in Japan proper and Taiwan, which provides that the manufacture of crude camphor and camphor oil shall be confined to those persons who have obtained the permission of the Government therefor, and the article so manufactured shall be taken over by the Government in return for suitable compensation according to quality. Formerly, the domestic consumption of camphor was confined to a small quantity, and a large portion of the Japanese camphor was exported to Europe and America. The rapid progress in the celluloid industry, however, has caused, of late, an increase in domestic consumption, which has resulted in the absorption of a large quantity of the camphor produced both in Japan proper and Taiwan.

4 Railways

From 1872 when the first railway in Japan (Tokyo-Yokohama) was laid as a Government undertaking, till 1905, the total length of railways, State and local lines combined, reached 7,687 kilometres, showing how steadily the railway net had extended throughout the country. The local lines aggregating 5,224 kilometres were distributed among 38 companies. This state of affairs was fraught with grave inconveniences, for even the ownership of trunk lines was divided between the State and private companies. The service lacked system, the work involved unnecessary expense, while the rolling-stock did not admit of common use. These resulted in a high freight tariff, delay in delivery and so forth. The Russo-Japanese War and the opportunity its termination afforded for expanding the State economic undertakings demanded the unification of the railway service in order to have it carried to a state of greater efficiency. In March, 1906, the Nationalization of Railways Law was enacted and the Government effected in the fiscal years 1906 and 1907 the acquisition of 4,540 kilometres of railways belonging to 17 companies. For the State railways that were thus suddenly

Digitized by Google

expanded, a Special Account was established.

Under the Imperial Railways Special Account Law revised by Law No. 6 of 1909, the receipts and expenditures of the Imperial Railways were set apart, as they are now, as a purely special account and independent of the General Account. The Imperial Railway capital, and funds for materials required for the Imperial Railways, and all moneys to be invested are made the capital of these railways and a special account is established by applying the annual revenue therefrom to the annual expenditure. The amounts required for the construction and improvement of railways are defrayed out of railway profits; and in the event of a deficit, or in case of consolidating or redeeming public or temporary loans chargeable to this account, the Government is authorized to issue, as a charge on the same account, public loans or make temporary loans from other special accounts or other sources. The public and temporary loans above referred to are the public loans already issued to defray expenditure required for carrying on the railway enterprise, the public loans already issued or to be hereafter issued for the consolidation or redemption of the loans last-mentioned, the public loans issued under the provisions of the Railway Nationalization Law, and the debts chargeable under the same Law to the Government which have not yet been completely repaid, all these loans are chargeable to the special account under consideration; and the amount required in each financial year for their redemption or payment of interest thereon is to be transferred to the Special Account for the National Debt Consolidation Fund. The Railway Special Account is subdivided into the Capital Account, the Revenue Account, and the Stores Account. The Capital Account has for its revenue the moneys transferred from the railway profit, proceeds of public and temporary loans, proceeds of sale of its property, receipts from materials and structures for railway use, and miscellaneous receipts belonging to it, and for its expenditure the cost of the construction and improvement of railways, redemption of its debts, cost of materials and structures for railway use, and other miscellaneous expenses chargeable to it. The Revenue Account has for its revenue various receipts from the working of railways, charges for the loan of articles forming part of its capital, interest on deposits and miscellaneous receipts belonging to it, and for its expenditure various expenses required for the working of railways, expenses for the upkeep, repair, and replacing of articles forming part of the capital, interest on debts, and miscellaneous expenses chargeable to it. Any balance of the total annual revenue over the total annual expenditure in the Revenue Account forms the profit, while what remains after deducting therefrom the amount to be transferred to the Reserve Account is to be transferred to the Capital Account. The Stores Account has for its capital the capital outlays hitherto expended and those to be expended hereafter and has for its revenue the revenue from the Railway Stores and Workshops and miscellaneous receipts, while expenditure consists of the expenditure on and in the Railway Stores and Workshops and miscellaneous expenses chargeable thereto.

Public Debts

The Japanese Government issued its first public bonds in London in April, 1870, to the amount of £1,000,000 (¥9,763,000) at a price of

Digitized by Google

98, bearing interest at 9 per cent., and maturing in 1882. In 1873 a 7 per cent. loan of £2,400,000 was issued at a price of 92.5 to mature in 1897. No other foreign loans were paid at maturity. Prior to the issue of the first bonds, frequent borrowings were made by the Government from wealthy merchants in Osaka and Kyoto. Also to redeem borrowings from France the Tokugawa Shogunate borrowed $500,000 Mex. from the Oriental Bank, Yokohama, a British institution. The first internal bonds were issued in March, 1873, for the purpose of covering the whole debts inherited from the feudal clans. The amount of issue was ¥10,972,725, followed a little later by another issue of ¥12,422,825. In 1874 capitalized pension bonds were issued to the total amount of ¥16,565,850 and were distributed to those who returned their land to the Government. These bonds were replaced by hereditary pension bonds, which were issued in 1876, to the amount of ¥173,902,900. War debts issues by the Government were in the form of borrowings from the Fifteenth National Bank to the amount of ¥15,000,000 in connection with the Satsuma Rebellion of 1877. At the end of that year the outstanding funded debts of the Government totalled ¥236,000,000, a fairly large amount at that time. In 1878 the Enterprise Bond Act was promulgated and the first bonds of the kind were issued to the amount of ¥12,500,000 with an interest rate of 5 per cent. and issue price of ¥80. Finance Minister Masayoshi Matsukata undertook the readjustment of bonds in 1886 and in October of the same year the Readjustment Bond Act was promulgated. The outstanding funded debts with interest rate of more than 6 per cent. at the beginning of 1886 totalled ¥175,000,000, and this amount was converted into readjustment bonds for redemption in the next 12 years and the interest rate was lowered to 5 per cent. thereby saving the Government about ¥3,000,000 a year. The national debt of ¥260,000,000 before the outbreak of the Sino-Japanese War (1894) increased to ¥350,000,000 in 1895 and ¥500,000,000 in 1899. A rapid increase was experienced through the Russo-Japanese War and in 1910 the outstanding debts totalled ¥2,600,000,000. This was due to the fact that money used to pay the expenses of the Russo-Japanese War was obtained through bond issues to the amount of ¥1,400,000,000. The taking over in 1906, of 17 of the principal private railways under nationalization was also responsible for a large increase. Bonds worth ¥476,000,000 at 5 per cent. were delivered to the private railway companies in payment for their undertakings being taken over by the government. Bonds during the Russo-Japanese War were frequently issued at home and abroad. In Great Britain and America, Japan issued the 1st 6 per cent. sterling bonds, £10,000,000; the 2nd 6 per cent. sterling bonds, £12,000,000; the first 4.5 per cent. sterling bonds, £30,000,000; and others totalling altogether £82,000,000, or about ¥800,000,000. In connection with Japan's sending of expeditionary forces to Tsingtao and Siberia on the Allies' cause, the Government issued bonds eight times with an aggregate of ¥499,000,000 between 1919 and 1922. Besides, "delivery" bonds of ¥115,000,000 were issued for conferment of war bonus. At the end of the Kiyoura Cabinet foreign loans involving ¥550,000,000 were raised to meet the great earthquake and fire reconstruction work.

After the Russo-Japanese War, the total indebtedness increased slowly until 1910 and then declined

Digitized by Google

slightly in the years immediately before the World War. The extent of the improvement in the government's credit is evidenced by the fact that in 1910 the government floated a 60-year loan of £11,000,000 in London, and another 60-year loan of 450,000,000 francs in Paris, both bearing interest at 4 per cent. and selling at 95 and 95.5 respectively. These loans were floated for the purpose of retiring domestic loans. From the end of 1913 to the end of 1916, the total debt was decreased by about ¥131,000,000. Then, during the next three years, it increased by more than ¥700,000,000. The large budget deficits of the post-war years are reflected in the virtual doubling of the public debt since 1918. Except 1930-1931 the national debt has been on the increase ever since, amounts outstanding at the end of the fiscal year 1932-1933 reaching ¥7,054,195,552.

According to the report of the Finance Ministry, at the end of the fiscal year 1933-1934, or March 31, 1934, the outstanding amount of national debt reached ¥8,139,038,392, an increase of ¥1,084,843,000 as compared with the preceding year. Besides, there is ¥543,645,000 of rice securities which increased ¥323,281,000 on the preceding year as a result of the promulgation of the Rice Control Law.

In the fiscal year 1934–1935 loans amounting to approximately ¥1,000,000,000 was floated, and at the end of March, 1935 the total amount of national debt reached ¥9,090,454,000, increasing ¥951,416,000 as compared with the previous year.

The table on national debts outstanding March 31, 1935, follows :

AMOUNTS OF NATIONAL DEBTS OUTSTANDING

(In ¥1,000)

Internal loans:	
Five per cent. loans	1,869,151
Five per cent. loan (Special)	120,816
Five per cent. loan (Mark "Ko")	896,698
Four per cent. loan (1st series)	164,890
Four per cent. loan (2nd series)	94,468
Four per cent. loan	43,817
Five per cent. Exchequer bonds	2,330,761
Four and a half per cent. Exchequer bonds	715,000

Provincial Finance

A uniform financial system was adopted in Japan in July, 1871, when prefectural governments were established to take over the power formerly wielded by the clans, which were then to be abolished. Taxes on people formed the largest source of revenue. The total revenue for prefectural taxes in 1873 was only ¥14,800,000, of which taxes on people totalled ¥14,200,000. Public expenses, school expenses and land tax revision expenses were the principal items of expenditure. In July, 1878, regulations were issued by the Central Government, to the effect that a distinction should be made between the expenses of prefectures and other bodies, such as cities, towns and villages, and the budget of each prefecture for the next fiscal year was to be formulated before February and submitted to prefectural assemblies and then to both the Home and Finance Ministries. With the introduction of regulations concerning cities, towns and villages in 1887, the local self-government

Digitized by Google

system was consolidated and a great change in provincial finance was brought about. The self-government system for prefectural administrations was enforced in 1891, and the expenses of these bodies have considerably expanded as years have gone by. In 1914, when the World War broke out, their revenue totalled ¥374,000,000 and expenditure ¥327,000,000. Enterprises such as road and bridge building, harbour construction, public works and others, were undertaken, and disbursements increased proportionately. Expenditure in 1924 totalled ¥1,300,000,000, and the Kato (Tomosaburo) Cabinet tried to bring about retrenchment in provincial finance, but no success was achieved.

Local Expenditures

Local expenditures as a whole have been on the decline since 1927, which was the peak, as a result of the retrenchment policy necessitated by the depression. It has turned, however, to rising tendency in these two or three years as a whole.

Note: Since 1932-33 the figures represent the budget estimates.

Prefectural Finance in 1934-35 In the 1934-1935 fiscal year budget, the total revenue of the prefectures amounted to ¥492,176,000, and the average revenue of a prefecture was ¥10,472,000. The increase was ¥513,000 in the former and ¥11,000 in the latter. The most important source of revenue was taxes which represented 46 per cent. of the total revenue. The supertax on the direct state tax, which amounted to 24 per

Digitized by Google

cent., subsidies from State Treasury, and prefectural loans are also other important sources.

Of the expenditures which amounted to ¥492,176,000, 23 per cent. was for public works, 22 per cent. for education, 17 per cent. for police and 14 per cent. for various enterprises.

Of the prefectural expenditures, ¥55,156,000 of Tokyo prefecture was the largest, followed by ¥29,030,000 of Osaka, ¥25,164,000 of Aichi, ¥23,595,000 of Hyogo, and ¥19,870,000 of Fukuoka. The expenditure of Yamagata, Fukushima, Chiba, Kanagawa, Niigata, Nagano, Gifu, Shizuok, Kyoto and Hiroshima was more than 10,000,000 each, while expenditure of most of other prefectures ran between ¥4,000,000 and ¥10,000,000. The expenditure of Nara and Okinawa prefectures was less than ¥4,000,000 respectively.

Outstanding Debts Outstanding funded debts of provincial self-governing bodies which at the end of 1897 amounted to ¥89,266,115, stood at ¥2,728,249,752 on March 31, 1933. Borrowings are mostly for public works, education, hygiene, industrial development, public utility and other enterprises. The list of these outstanding debts on March 31, each year, in ¥1,000, follows :

	Prefectural governments	Cities	Towns and Villages	Others and total
1924	193,204	624,844	81,655	924,532
1925	269,117	727,747	95,597	1,119,189

Deposit Bureau of the Department of Finance

Organization Although the Deposit Bureau of the Department of Finance has been in existence since 1877, it was only after many changes that the present system was established in 1925. The chief of this Bureau is under the control and supervision of the Minister of Finance and he is responsible for its activities and efficency. Its finances are segregated in a Special Account and the Bureau is given control over the expenditure of its entire revenue. The chief business of the Bureau is not merely confined to the control of deposits, but also includes the investment and management of other funds. The deposits, which are made according to laws and ordinances, consist, for the most part, of postal savings deposits received by the

Digitized by Google

Government; but the funds of the Deposit Bureau also include other deposits, reserves in the Special Account of the Deposit Bureau and surpluses. All business connected with receipt and payment of cash is transacted on behalf of the Bureau by the Bank of Japan in accordance with instructions from the Minister of Finance.

Investment of the Funds It is laid down by law that the funds of the Deposit Bureau are to be invested solely for the benefit of the State and the public in profitable and safe manner, and that such investments are to be made only after investigation of their purposes and methods in consultation with the Committee on Investments of the Deposit Bureau.

Committee on Investments This Committee consists of the following members: The Minister of Finance, as the chairman, the Parliamental Vice-Minister of Finance, high officials of the Government Offices concerned, one of the Chief Auditors of the Auditing Board, the Governor of the Bank of Japan and other learned and experienced persons. The number of full members is not to exceed fifteen; but in order to meet special needs, temporary members may be appointed. The Committee is placed under the supervision of the Minister of Finance, and its function is to answer the questions of the Minister, after both investigation and study of matters relating to the investment of the funds of the Deposit Bureau. At the beginning of every fiscal year, the Minister of Finance is to draw up the necessary plan to govern the investment of the funds to submit it to this Committee, and the same process is to be undertaken should there be any occasion to supplement or to change this plan. In addition to answering the question of the Minister of Finance the Committee may send him proposals concerning the investment of the funds of the Deposit Bureau. The Minister should present to the Committee, after every fiscal year, a report stating particulars of important matters concerning conditions of investment of the funds of the Deposit Bureau and changes in the funds invested.

Method of Investment As mentioned above, the funds of the Deposit Bureau are to be invested for the benefit of the State and the public welfare in a profitable and the safe manner. Consequently, in conformity with this principle, the investment of funds is to be limited to the following items:

(a) The subscription to, underwriting or purchasing of national loans or making of loans to the General or Special Accounts of the Government.

(b) The subscription to, underwriting or purchasing of local loans or health insurance associations.

(c) The subscription to, underwriting or purchasing of bonds issued by corporations organized under special laws or making of loans redeemable within a period not exceeding three years to these corporations.

(d) Loans to banks organized under special laws but not authorized to issue debentures.

(e) The subscription to and purchasing of foreign Government bonds.

(f) Deposits with the Bank of Japan to be held abroad for designated purposes.

These items only indicate the method of the investment of the funds and the question whether any particular investment is for the promotion of the benefit of the State or public welfare or whether it is profitable and safe is left to the joint consideration and decision of

Digitized by Google

the Minister of Finance and this Committee.

Local funds representing the funds to be invested for the benefit of local districts to local public corporations, various associations and individuals are advanced from the Deposit Bureau to the borrowers either directly or through special banks and similar institutions. These funds are allotted for the following purposes :—

A Advances to be generally made every year for :

(a) Public utility undertakings of public corporations such as water supply works, prevention of disasters, sanitary arrangements, improvement of roads, rivers and harbours, road making and construction of bridges, reclamation works, construction of school-houses and teachers' dwelling-houses, electric and gas enterprises, and tramway, local railway and car enterprises.

(b) Social works such as housing reform and the establishment of public markets, public pawnshops, day nurseries and intelligence offices and others.

(c) Enterprises by various associations such as land adjustment associations, industrial associations, forestry associations, fishery associations, live-stock breeding associations, manufacturers' associations and commercial associations and those by federations of these associations.

B Advances to be made for urgent needs :

Repair works of disasters, reconstruction works necessitated by the earthquake, accommodation to the silk-raising industry, the relief of the employed, and accommodation to middle and lower class merchants, manufacturers and farmers.

C Advances to be made for :

Such institutions as public corporations and various associations in the colonies. As to the rate of interest paid on the deposits, it is to be noted that the rate was reduced to 3 per cent. annum for the greater part of postal savings. The postal savings amount to about 71 per cent. of the total amount of the funds of the Deposit Bureau. Other deposits are divided into two classes, namely, fixed deposits and ordinary deposits. The rate of interest on fixed deposits is in principle 3 per cent. per annum, but the rate on deposits of such character that the depositing of cash is confined by laws and ordinances to the Deposits Bureau is 3.5 per cent. The rate on ordinary deposits is in principle 2 per cent. per annum, while that on deposits of corporations other than public corporations is 1 per cent. These rates have been effective since October 1, 1932. On the other hand, the rate for the greater part of the funds advanced before October 1, 1932 remains 4½ per cent. and that for the new advances made after that time is 3½ per cent.; but when advances are made through banks and similar institutions, these intermediate institutions gain $\frac{1}{10}$ per cent. and the actual borrowers must pay at the rate of 4½ per cent. for the advances made before October 1, 1932 and $3\frac{9}{10}$ per cent. for those after that time.

Accounts of the Bureau Assets and liabilities of the Deposits Bureau at the end of 1933-34 fiscal year (March 31, 1934) totalled ¥4,074,209,662 each, showing an increase of ¥342,891,890 over the same period of the year before.

State Property

State property is defined under Article I of the State Property Law, promulgated by Law No. 43 in April, 1921 as follows :

"The State property under this Law includes the State-owned real estate and movable estate and rights provided in the Imperial Ordinance." The value of State property is shown below :

	General Accounts	Special Accounts	Total
	(In yen)		
1924	4,189,793,211	1,942,271,168	6,132,064,379
1925	4,221,005,238	2,122,681,903	6,343,687,142
1926	4,269,586,429	2,301,230,572	6,570,817,001
1927	4,729,822,218	2,527,426,509	7,257,248,723
1928	4,798,480,264	2,704,931,432	7,503,411,696
1929	4,914,642,478	2,922,347,476	7,836,989,955
1930	5,016,980,596	3,094,405,380	8,111,385,976
1931	5,083,477,781	3,228,063,095	8,311,540,876
1932	4,720,478,566	3,280,022,777	8,000,501,343
1933	4,839,306,128	3,353,423,688	8,192,729,816

The value of State property under the jurisdiction of the colonial Governments on March 31, 1933, was as follows :

Government-General of Korea	¥599,387,179
Government-General of Formosa	287,199,877
Government of Karafuto (Saghalien)	48,557,642
Government of Kwantung	158,636,081
Government of South Sea Mandated Islands	16,142,834
Total	1,109,923,616

Estate and Rights The State-owned movable estate and rights are as follows :

(a) Ships, floats, floating piers and floating docks,

Digitized by Google

(b) Appendages of real estate or movable estate given in (a).

(c) Machines and important equipment in Government factories such as iron works, shipbuilding yards, arsenals, the mint, tobacco mills, and railways.

(d) Surface rights, servitudes, mining rights, alluvial mineral rights and other rights similar to these rights.

(e) Rights relating to stocks and investments.

The scope of the term "factory" under (c) above is to be determined by the respective Ministers after consultation with the Minister of Finance.

State-owned movable estate and rights, such as, cash, deposits, loans, common fixtures and books, for instance, not mentioned in the above provisions are therefore State property in substance, but do not come under the provisions of this Law.

Four Classifications Article 2 of the State Property Law divides State property into four classes, namely, public property, official property, property used for forestry management and miscellaneous property. Public property is that directly used or to be used for public service by the State; official property is that used or to be used, by the State, for Shinto shrines, or for State services and enterprises or for residences of officials and other personnel; property used for forestry management is that used or to be used, by the State, for the management of forests; while miscellaneous property is that not belonging to these three categories.

The Legal Limitation The Legal limitation of the content of the "State Property Account" and its categories:

Article 26 of the State Property Law requires the Government to make a yearly statement of the increase or decrease in the State property, and, every fifth year, to issue a comprehensive report covering the entire property for the period; and both these statements are to undergo examination by the Auditing Board and then are to be presented to the Imperial Diet.

The following are, however, excluded from the statements:

(a) Movable estate and rights owned by the State but not subject to the provisions of the Imperial Ordinance, that is, State property in reality if not in law (Art. 1, State Property Law; Art. 1, Imperial Ordinance concerning the State Property Law).

(b) State property belonging to the Governments of Chosen, Taiwan, Karafuto, Kwantung, and South Sea Mandated Islands in which the State Property Law has not yet been put into effect.

(c) Public property (Art. 28, State Property Law).

(d) The value of lands used for religious purposes by Buddhist temples, the public land of public corporations, and of sites of Shinto shrines (Art. 2 and 5, Ordinance No. 14, Department of Finance).

The figures given above are based on these official statements of State property, and accordingly, the total value of the property owned by the Imperial Japanese Government including State property mentioned in (a)—(d) above will be much higher than the figures given herein. Paragraph (b) above excludes property in the colonies, but for the purpose of reference this has been added as an appendix to the table of State property. Recognizing that it is expedient to apply the State Property Law to these colonies, the Government is now making preparations therefor, and when this law is put into effect, the property in these

Digitized by Google

regions will be included in the statements. Further, as there prevails an opinion that the value and volume of property mentioned in (c) and (d) should be given in the statements, they will be included therein in the near future.

Administration of State Property The administrative service over State property includes both direct management and general administration, the former under the direction of the respective Departments, the latter under the Minister of Finance. Each Minister administers the State property of his Department; but the Minister of Finance also undertakes, as the competent Minister, the general management of all the property and, thus, unifies the direct management by keeping the different Ministers in touch with one another so as to secure the full use of the property.

The Increasing Tendency The tendency of State property to increase is indicated in the table of statistics given above, and is due to the purchase, expropriation and contribution of property, construction of buildings and ships, and the acquisition of rights (acquisition of real estate without owner, acquisition of stocks and of rights due to investment, establishment of surface rights, etc.). Moreover, the revaluation of property made every fifth year causes an increase or decrease in the total value of State property.

Funds from the Adjustment of State Property With the exception of receipts coming under other special accounts and those from the disposition of state forests and plains or of uncultivated places in the Hokkaido, the receipts from the adjustment and disposition of State property and other miscellaneous receipts constitute the funds from the adjustment of State property and the revenue and expenditure are segregated in a Special Account.

These funds are transferred to the General Account and then, in addition to being used for building and repair and other expenditure necessary for the adjustment of State property, are, in case of necessity, used for purposes other than those mentioned above in accordance with the Budget Estimates (Articles 1—4, Special Account Law for Funds from the Adjustment of State Property by Law No. 6, 1922; Exceptions in the Special Account Law for Funds from the Adjustment of State Property by Law No. 15, 1927).

The following are the statistics of revenue and expenditure in the funds from the adjustment of State property for the financial years 1925-26 to 1934-35:

Year	Revenue Yen	Expenditure Yen
1925-26	5,271,904	2,202,806
1926-27	8,802,504	2,566,297
1927-28	12,904,110	15,228,282
1928-29	11,373,386	15,918,470
1929-30	9,349,573	9,102,751
1930-31	6,439,664	6,237,805
1931-32	4,870,211	5,963,898
1932-33	7,700,317	5,906,825
1933-34	6,865,283	6,864,849
1934-35	6,259,334	6,259,077

Japan's National Wealth

The national wealth of Japan proper for 1930, the most recent date for this kind of investigation, was estimated at ¥110,188,000,000, according to the Cabinet Statistics Bureau. This included the following:

	(Estimates in thousand yen)
Land	41,091,348
Mines	6,499,651
Ports, harbour and canals	343,143
Bridges	483,000
Trees	6,706,815
Live-stock and poultry	846,356
Buildings	22,843,300
Industrial machines and apparatus	1,809,381

Digitized by Google

		(Estimates in thousand yen)
Railways and tramways (street cars)		3,598,188
Vehicles and aeroplanes		660,294
Shipping		2,060,236
Electric and gas supply equipment		1,905,044
Telegraph and telephone equipment		196,102
Waterworks equipment		352,779
Property in store:		18,847,310
Household property	12,473,201	
Manufactures	5,457,466	
Coins and gold and silver bullion	916,643	
Miscellaneous		2,250,515
Balance of Japan's foreign credit and debt		191,592
Total		110,188,004

The total is classified into Government property 12 per cent., public property 4 per cent. and private property 84 per cent. Land, buildings, trees and mines combined make a total of 81 per cent. in all. Manufactured goods, railways and tramways, shipping, electric and gas equipment and industrial machines and tools combined make a total of 13 per cent. The remainder is 6 per cent. The national wealth for 1930 per household was ¥8,672 and per one man was ¥1,710. The change of national wealth, investigated by Mr. Hideomi Takahashi, a statistical authority in Japan, follows:

Time of	Year	National wealth (in million yen)
Arrival of "Black Ships"	1851	5,085
Sakuradamon Murder Incident	1860	5,769
Meiji Restoration	1868	6,818
Abolition of feudal clans and establishment of prefectural government	1878	7,317
Satsuma Rebellion	1877	8,571
Promulgation of Imperial Constitution	1889	13,043
Sino-Japanese War	1894	16,667
Russo-Japanese War	1904	22,742
First Year of Taisho Era	1912	87,524
	1921	93,026
June,	1924	101,978
March,	1925	105,742

National Income The national income since 1887 in Japan proper has been as follows, according to the Cabinet Statistics Bureau:

Year	National income (in ¥ 1,000)	Index number
1887	233,522	100.00
1890	235,529	100.85
1900	846,080	315.06
1910	2,050,841	878.35
1915	2,342,040	1,003.05
1920	7,653,784	3,406.43
1922	13,391,022	5,735.07
1923	13,255,057	5,676.82
1924	12,882,761	5,517.39
1925	13,382,323	5,731.32
1930	10,635,785	4,554.51

CHAPTER IX

BANKING AND THE MONEY MARKET

When the Meiji Government announced that all taxes had to be paid in cash instead of rice, (see Chapter VIII, Taxes) which had been the sole substitute for money in tax payment during the Tokugawa régime, there arose a great demand and consequent shortage of money all over the country. The superseding of feudal clans by prefectural governments had necessitated the issue of bonds by the Meiji Government in order to pension off the daimyō and samurai. Furthermore, the Government had to readjust the inconvertible paper notes so recklessly issued toward the latter stage of the Tokugawa Administration. Such was the position when Shigenobu Okuma (the late Marquis), Minister of Justice, in conjunction with Kaoru Inouyé (later Marquis), Vice-Minister of Finance, instructed Hirobumi Ito (the late Prince), who was then visiting New York on his way home from an inspecting tour of England and Germany, to draw up a plan for a financial system for Japan. Ito met New York bankers and listened to their opinions on the adoption of a modern banking system in Japan. The United States at that time had a national banking system, and it was such a national bank system that was recommended to and finally adopted by Japan. The text of the scheme was brought home by Ito and the first difficulty that arose was in connection with the translation of the word "Bank" into Japanese. A new word had to be coined, and though "Ryogayé-ya", money exchange shop, and "Kinko" office to handle gold were suggested, "Ginko", an office to handle silver, was the final selection on account of the country's decision to adopt the silver standard of currency.

National Banks

The Japanese National Bank Act was promulgated in November of the 5th year of Meiji (1872) and this formed the cornerstone of the banking business in Japan. The banks established in accordance with this Act were the First National Bank, Tokyo; the Second National Bank, Yokohama; the Fourth National Bank, Niigata; and the Fifth National Bank, Kagoshima. The First National Bank, founded by Eiichi Shibusawa (the late Viscount), was invested in jointly by the Mitsui-Gumi and Ono-Gumi to the amount of ¥2,000,000 out of the total capitalization of ¥3,000,000. The remaining amount of ¥1,000,000 was offered for public subscription. Due to the lack of knowledge of the people regarding the nature of public subscriptions to shares there is little wonder that only ¥448,000 was subscribed. The bank was opened on August 1, 1873. H. E. Shand, a clerk of the Oriental Bank, a British institution in Yokohama, was engaged by the bank to teach Japanese clerks banking business. With the revision of the National Bank Act in 1876, the number of banks in Japan greatly increased. There were 153 banks with a total capitalization of ¥37,000,000 and with authority to issue notes at the end of 1879. The National Bank Act provided for conversion of the national bank notes

Digitized by Google

into specie. An amendment was made in 1883 in the Act, by which the privilege of issuing notes was taken away from the national banks and granted exclusively to the newly-created central banking institution, the Bank of Japan, and suitable measures were taken for redemption of the national bank notes. Meanwhile, private banks and bank-like business companies, which did not come within the purview of the National Bank Act had increased in number, until their total number reached 954 in 1884, and there were no general provisions to control such banks and companies. To bring them under one efficient control, the Ordinary Bank Act and Savings Bank Act were promulgated in 1890 and put into force three years later. Side by side with these private banks, the national banks acted from the first as financial institutions of general trade. When the terms of their respective charters expired, most of them continued business as ordinary banks, and by February, 1899, national banks ceased to exist, so that there was no longer any difference between the economic functions and legal nature of the former national banks and other ordinary banks, all of which are controlled by general banking law. Ordinary banks are placed under control of the Minister of Finance, whose licence is required for the establishment of a new bank or the amalgamation of existing banks ; he is also empowered to order at any time investigation into the business condition and property of a bank. Every bank must every half-year prepare and present to the Minister of Finance a balance-sheet and other business reports, the former to be published in newspapers or by some other means. Provisions are also made in the Act with regard to business hours and holidays.

Bank Act of 1927

Though a few amendments had been made from time to time since its enactment, the greater part of the Bank Act of 1890 became obsolete and inadequate on account of a rapid progress in the financial and economic conditions of the country. A new Act, therefore, was promulgated on March 29, 1927, in place of the old legislation, and was put into effect on and after January 1, 1928. The features of the new Act follow in summary :

(1) Banks as defined in the Banking Act are in principle institutions which carry on the operations of giving as well as receiving credits.

(2) Participation in banking business is confined to joint stock companies having at least the minimum capital[1] prescribed by the Act.

(3) The use of the word "Bank" (Ginko) in the trade name is made compulsory for every bank, and the use of the word is prohibited to businesses not being banks.

(4) Banks are strictly prohibited from engaging in business activities other than those prescribed in the Act.

(5) A bank shall, until the full amount of its capitalization is reached, set aside each time that a dividend is paid on profits 10 per cent. of such profits as a reserve fund.

(6) A strict audit system is established.

(7) Managers or managing-directors while actively engaged as such are not permitted to participate in the management of other companies without sanction of the Minister of Finance.

1 The minimum paid-up capital for a bank in Tokyo and Osaka must be not less than ¥2,000,000; for towns of more than 10,000 population not less than ¥1,000,000; and for smaller communities not less than ¥500,000.

Digitized by Google

(8) The Court of Justice shall exercise closer supervision over the liquidation of banks.

(9) The Minister of Finance is empowered to make necessary provisions respecting banks with head offices outside the area, desirous of doing banking business within the area in which the Act is in force.

(10) The power of the Minister of Finance respecting the cancellation of business licences and the giving of various sanctions to banks is greatly increased and the penalties for illegal acts by banks shall be made heavier.

Savings Banks

A Savings Bank Law enacted in 1921 superseded the Savings Bank Act of 1890 and was put into force from June 1, 1922. Certain amendments were made in 1931. The Tokyo Chozo Ginko, or Tokyo Savings Bank, is the only prototype of this kind of bank in Japan. Ten years before the enactment of the law of 1890 concerning savings banks in Japan this bank came into being. As the late Viscount Eiichi Shibusawa was a great benefactor of the present banking system of Japan, so also was the late Rokuro Hara, the founder of the Tokyo Chozo. This bank was founded in 1880 with a small capital of ¥20,000.

Essential points of the Savings Bank Law enacted in 1921 follow:

Savings banks are institutions carrying on the following business:

(1) The receiving of deposits at compound interest;

(2) The receiving of sums of less than ¥10 as deposits at one time;

(3) The receiving of deposits periodically or several times during a certain period and the fixing beforehand of the time of repayment; or

(4) The receiving of money periodically or several times during a certain period under promise to pay a certain amount of money at a certain date. In addition, savings banks are authorized to take up subsidiary business, such as:

(a) The receiving of fixed deposits;

(b) The receiving of valuable articles for custody;

(c) The collection of debts;

(d) The receipt and payment of money as treasurers of public corporations or industrial associations;

(e) The receiving of deposits on demand from public corporations or industrial associations;

(f) The sale on the instalment plan of national bonds, prefectural bonds and debentures of corporations created under special laws; and

(g) The transacting of business in connection with the issue of national bonds and other bonds and debentures referred to above or the payment of their principal and interest.

While no savings bank can carry on business other than that mentioned above, no ordinary bank can carry on the proper business of savings banks. Savings banks shall not carry on transactions requiring the cashing of cheques against the deposits of (1) and (2) mentioned above under the heading of proper business. A savings bank must be a joint-stock company with a minimum capital of ¥500,000 and must obtain a licence from the Minister of Finance. Savings banks are not permitted to invest their funds in ways other than the following:

(1) To subscribe for, take up, or purchase national and provincial bonds and debentures or stocks approved by the Minister of Finance;

(2) To make loans on pledge of national bonds and other securities referred to above;

(3) To make loans on mortgage of real estate;

Digitized by Google

(4) To make loans to a depositor up to the amount of his deposits;

(5) To make loans to the amount of his deposits to a person who deposits money periodically or several times during a certain period under promise to pay a certain sum of money at a certain date;

(6) To make loans up to the amount already paid in to a person who receives the securities under a contract made with respect to the sale of securities on the instalment plan;

(7) To make loans redeemable within a period of one year to prefectures, cities, towns and villages;

(8) To make loans redeemable by instalments within a period of two years;

(9) To deposit money with banks or the Deposits Bureau of the Ministry of Finance or the post office;

(10) To deposit money or securities with trust companies in accordance with the Ordinance issued by the Ministry of Finance; and

(11) To purchase bills accepted by banks or trust companies.

Further restrictions on their business are as follows:

(1) Savings banks shall not own or take as security for loans or deposits more than one-fifth of the total stock of a company.

(2) Loans to a person shall not exceed one-tenth of the total amount of the paid-up capital and reserve fund of the bank.

(3) The total amount of loans on mortgage of real estate or the total amount of loans redeemable within a period of one year to prefectures, cities, towns and villages shall not exceed the total amount of the paid-up capital and reserve fund of the bank.

(4) The total amount of loans redeemable by instalments within a period of two years shall not exceed one-fifth of the paid-up capital and reserve fund. In this case, loans to a person shall be less than ¥1,000 and reliable guarantees of more than two persons are required.

(5) The total amount of deposits with any bank and of bills purchased with the acceptance of such bank shall not exceed one-tenth of the amount of the deposits received and one-fourth of the paid-up capital and reserve fund of the said bank.

(6) A regulation given under (5) above is applicable correspondingly to property deposited with trust companies and the total amount of bills purchasable as accepted by the trust companies. Savings banks are obliged to deposit an amount of Government bonds with the Public Deposits Bureau of the Ministry of Justice as guarantee for repayment of the deposits, such bonds to be not less than one-third of the deposits. Savings banks may, however, replace these bonds with the deposits in the Deposits Bureau of the Ministry of Finance. When a savings bank is unable to meet its liabilities with its assets, the directors are jointly under unlimited liability as regards the deposits received before their registration of resignation, and this liability continues for two years after such registration. The above statements refer to ordinary and savings banks, but there exist in addition special banks which are controlled under special laws.

Present Status

In 1932 the number of banks in Japan was 652 with 6,690 branch offices, decreasing 146 and 558 respectively as compared with the previous year. Details of the conditions of banks in Japan proper in 1924-1933 follow:

The Bank of Japan

(Nippon Ginko)

The Bank of Japan, the central bank of the Empire, was founded in 1882 as a joint-stock company. Its authorized capital, which was at first ¥10,000,000, was increased three times and now stands at ¥60,000,000, of which ¥45,000,000 is paid up. The Bank is authorized to issue bank notes against gold and silver coins and bullion and further to issue such notes on security of Government bonds and Treasury bills, and other

Digitized by Google

bonds and commercial bills of a reliable nature. In June, 1932, amendments were made in the Convertible Bank Note Regulations, whereby the maximum amount of the issue against securities was increased up to ¥1,000,000,000 as from July 1 of the same year. The Bank is also authorized to issue notes against such securities beyond the maximum mentioned above. In case the issue in excess of this limit is to continue beyond 15 days, however, the approval of the Minister of Finance is required, and such issues to be made as from the 16th day are subject to a tax of at least 3 per cent. per annum. The payment of the tax formerly imposed on the issue of bank notes against securities was also replaced by a system of payments to the Government by the Bank of Japan, which was created by Law No. 10 of June 18, 1932. Under this system adopted during and after the second half of 1932, the Bank of Japan is required to pay to the Government for each half year one-half of the remainder of the net profits after deducting such amounts as (1) the amount equivalent to 6 per cent. per annum on the paid-up capital, and (2) the amount equivalent to the minimum to be set apart as reserve fund pursuant to Article 10 of the Bank of Japan Act. When the remainder of the net profits after the deduction of the amounts mentioned in (1) and (2) above and of the amount to be paid to the Government exceeds the amounts equivalent to 4 per cent. per annum on the paid-up capital, the Bank is further required to pay three-fourths of such excess amount to the Government. The payments to the Government under this system are to be effected not later than the last day of August in respect of the first half year and not later than the last day of February of the ensuing year in respect of the second half year, and these payments are counted as losses in computing incomes under the Income Tax Law and net profits under the Business Profits Tax Law. The Advisory Council of the Bank of Japan was also created by Law No. 11 of June 18, 1932 which was put into effect as from July 1 of the same year. Its principal function is to act in consultation with the Governor of the Bank of Japan on the important operations of the Bank. It consists of the Governor of the Bank of Japan as president and not more than five members who are appointed by the Minister of Finance from among persons engaged in finance or industry, or men of learning and experience. Their term of office is three years. The business carried on by the Bank is principally as follows :

(1) To discount or purchase Government bills, bills of exchange and commercial bills ;

(2) To buy or sell gold and silver bullion ;

(3) To make loans on security of gold and silver coins and bullion ;

(4) To collect bills for banks, companies and merchants, who are its regular customers ;

(5) To receive deposits and to accept for custody articles of value, such as gold, silver and other precious metals and documents ; and

(6) To make advances on current accounts, or grant loans for fixed periods on security of Government bonds, Treasury bills and other bonds and shares guaranteed by the Government.

The Bank is, in addition, entrusted with the management of Treasury receipts and disbursements.

On April 7, 1934, there was promulgated the Law concerning Purchase of Gold by the Bank of Japan. According to the provisions of this Law, the Government is authorized,

Digitized by Google

for the purpose of keeping gold in the country, to enable the Bank of Japan to purchase and hold gold as prescribed by the Minister of Finance. The Bank of Japan is required to obtain the approval of the Minister of Finance as to the price of gold to be purchased under this Law. It is also required to apply gold so purchased to the reserves for exchange against the convertible bank notes; provided, however, that this does not apply to the case in which the Government orders the Bank of Japan to transfer the gold purchased by the Bank to the account of the Treasury at the Bank at its purchase price for making payments abroad or for meeting other special requirements. In applying, however, the gold purchased by the Bank to the reserves for exchange against the convertible bank notes, the valuation of such gold is made at the legal rate, that is, at the rate of one yen per 750 milligrammes of fine gold, and as a result, the difference between the amount paid by the Bank of Japan for the gold purchased and the amount obtained by the valuation of the same gold at the legal rate will be loss to the Bank of Japan. The Government, therefore, by way of making compensation for the sum representing such difference, assumes an obligation to the Bank for an equivalent sum and delivers to the Bank a certificate of indebtedness therefor. This obligation, however, bears no interest and is not in excess of 100 million yen. When the Bank of Japan transfers, in accordance with the order of the Government, the gold purchased by the Bank to the account of the Treasury at its purchase price, the Bank will apparently realize some profit, and the Bank is required to pay to the Government the sum representing such profit. In the case of any profit arising in respect of the gold purchased and held under this Law, the Bank of Japan is also required, as prescribed by the Minister of Finance, to pay to the Government the sum representing such profit. The Government repays the above obligation out of the payemnts of these two kinds made by the Bank of Japan. As the amount of tax paid by the Bank in respect of the issue of bank notes required for the purchase of gold under this Law becomes loss to the Bank, the Government makes compensation for such loss by delivering to the Bank, as prescribed by the Minister of Finance, the sum representing the tax on such issue. As has been mentioned above, this Law was promulgated on April 7, 1934 and put into effect on the same day, but, when the Government transfers to the Bank of Japan gold actually belonging to the account of the Treasury at the Bank at the time of the coming into operation of this Law, the gold so received by the Bank is considered as having been purchased under this Law.

Among the Governors of the Bank have been the late Baron Shinzen Matsuoka, the late Koichiro Kawada, the late Viscount Yataro Mishima, the late Baron Yanosuké Iwasaki, Mr. Korekiyo Takahashi, Minister of Finance, Baron Tatsuo Yamamoto, former Home Minister, the late Junnosuké Inouyé twice Minister of Finance, Otohiko Ichiki, once Minister of Finance and Hisaakira Hijikata. The present Governor is Yeigo Fukai. The term of governorship is five years, the holder being appointed by the Government. Important figures for the Bank at the end of each year, are:

Yokohama Specie Bank
(Yokohama Shokin Ginko)

The Yokohama Specie Bank was founded in 1880 with an authorized capital of ¥3,000,000 with the object of affording financial facilities for foreign trade. Subsequently, its capital was increased several times and now stands at ¥100,000,000, all paid up by June, 1920. This bank heralded the semi-Government banks in Japan, being established two years before the founding of the Bank of Japan. The money market of Japan as regards foreign trade was almost monopolized by foreign banks such as the Oriental Bank, the Hongkong and Shanghai Banking Corporation and the Chartered Bank of India, Australia and China, all having branches in Yokohama. Transactions in silver coins were handled almost exclusively by these foreign banks. A movement for restoring the national right and prestige was then gaining momentum among conservatives in Japan because of a rapid importation of Western material civilization in this country. This movement, coupled with a silver absorption policy, spread throughout the country and this culminated in an announcement by the Government of a plan for the establishment of a bank for the exclusive handling of specie in Japan. Michita Nakamura, an influential business man at that time, supported by Yukichi Fukuzawa, founder of Keio University, successfully persuaded the then Finance Minister Okuma to establish the Yokohama Specie Bank. It was planned that the bank should be capitalized at ¥3,000,000 silver, of which ¥1,000,000 was to be subscribed by the Government and the remaining ¥2,000,000 offered for public subscription. The shares were over-subscribed to the amount of ¥500,000. The business carried on by the bank consists of:

(1) Dealing in foreign exchange;
(2) Dealing in domestic exchange;
(3) Making loans;
(4) Receiving deposits of money and the custody of valuable articles;
(5) Discounting and collection of bills of exchange, promissory notes, and other securities; and
(6) Exchange of coins.

The bank also may buy or sell public bonds, gold and silver bullion, and foreign coins, if so required by the condition of its business. It may also be entrusted with matters relating to foreign loans and with the management of public money for international account. The bank has its head office in Yokohama and 36 branches and 8 sub-branches throughout the world. Its president is Mr. Kenji Kodama. During the Russo-Japanese War the bank under-

Digitized by Google

took the work connected with the floating of foreign loans for the Government. The bank also played an important part in Japan's economic activities in China after the Russo-Japanese War. Japan joined the Four-Power Consortium consisting of Great Britain, Germany, France and the United States in 1912. In 1913 the Yokohama Specie Bank, representing Japanese syndicate banks, concluded a 5 per cent. loan agreement for China as member of the Six-Power Consortium (Japan and Russia added). During the World War the Japanese syndicate banks lent money to Russia, Great Britain and France and underwrote bonds of these Governments. At America's initiative a new consortium was organized by Japan, Great Britain, America and France in 1919 and the Yokohama Specie Bank represented Japan in the consortium.

The Hypothec Bank of Japan
(Nippon Kwangyo Ginko)

The Hypothec Bank of Japan was created in 1897 for the purpose of making long-term loans at a low interest rate on mortgage of immovable property. Its authorized capital which was ¥40,000,000 till 1920 has been increased very often following mergers with 22 agricultural and industrial banks, so it now stands at ¥108,750,000, of which ¥84,626,063 is paid up. The business of this bank is mainly as follows:

(1) To make on mortgage of immovable property loans redeemable by annual instalments within a period not exceeding 50 years, or at a fixed time within a period not exceeding five years, provided in the latter case the total amount of such loans does not exceed twice the total amount of the paid-up capital and reserve fund. In the case, however, of loans for the fishery industry, they may be made on mortgage of fishery rights. Railway and tramway foundations shall be regarded as immovable property. The amount of loans made on security of residential land or buildings, other than sites or buildings belonging to factory foundations and factories, which lie in localities where the City Organization Law is in force or on city land to be designated by an Imperial Ordinance or the amount of loans made on pledge of claims secured by these residential land and buildings (including real estate mortgage certificates), and the amount of loans made under the City Planning Law to land re-arrangement associations or federations of such associations shall not exceed one-half of the total amount of the paid-up capital and mortgage debentures issued;

(2) To make loans without se-

Digitized by Google

curity to prefectures, cities, towns, villages and other public corporations organized by law;

(3) To make loans without security, redeemable at a fixed time or by annual instalments in the case of the adjustment of arable land under the law for such adjustments;

(4) To make loans without security, redeemable at a fixed time or by annual instalments to industrial, staple export manufacturers, fishery, forestry, stock-breeding or building associations, or federations of such associations;

(5) To make without security loans redeemable at a fixed time within a period not exceeding five years or by mutual instalments within a period not exceeding 10 years to a party of at least 10 persons, combined with joint liability, who are engaged in agriculture, industry or fishery in any prefecture where no Agricultural and Industrial Bank exists;

(6) To make without any security loans redeemable at a fixed time or by annual instalments to land re-arrangement associations or federations of such associations in case they apply to borrow for the re-arrangement of land to be undertaken under the City Planning Law or in case they, combined with joint liability, apply to borrow for the same purpose;

(7) With money obtained by the issue of hypothec debentures with premium, to make loans on security of cultivated fields, salt-pans, forests, pastures, fish-farms or fishery rights or on pledge of claims secured by these items (including real estate mortgage certificates);

(8) To take up debentures issued by the Agricultural and Industrial Banks, Hokkaido Colonization Bank, Central Bank for Co-operative Societies and Chosen Industrial Bank;

(9) To make loans redeemable by annual instalments on security of the claim on loans redeemable by annual instalments that are issued by these agricultural and industrial banks and of the mortgage in security for such loans;

(10) To make on pledge of claims secured by real estate (including real estate mortgage certificates) loans redeemable at a fixed time within a period not exceeding five years, and to buy and sell real estate mortgage certificates;

(11) To take deposits and take custody of gold and silver bullion and negotiable paper, provided that the total amount of deposits other than the fixed deposits and deposits of prefectures or cities shall not exceed the total amount of the paid-up capital.

Finally, the bank may employ the deposits and the money lying idle in the course of its business in the following manner only:

(a) To purchase with a sum equal to not less than one-fourth of the deposits national bonds or negotiable paper approved by the Minister of Finance or to deposit it in the Deposits Bureau of the Ministry of Finance or in banks approved by the Minister of Finance;

(b) To discount bills or make short-term loans on security of the above-mentioned negotiable paper or agricultural or marine products or industrial manufactures;

(c) To discount bills or grant overdrafts to industrial associations, staple exports manufacturers' associations, fishery associations or federations of such associations;

(d) To make short-term loans to public corporations;

(e) To make short-term loans without security to a party of at least ten persons, combined under joint liability, who are engaged in agriculture, industry or fishery in

Digitized by Google

any prefecture, where no Agricultural and Industrial Bank exists; and

(f) To use fixed deposits as funds for making on security of real estate or fishery rights or on pledge of claims secured by real estate (including real estate mortgage certificates) loans redeemable at a fixed time within a period not exceeding five years.

The Hypothec Bank is authorized, when at least one-fourth of its nominal capital has been paid up, to issue mortgage debentures to an amount not exceeding 15 times its paid-up capital, provided the amount of such debentures shall not exceed the total amount of outstanding loans redeemable by annual instalments or at a fixed time, and the debentures of the Agricultural and Industrial Banks, Hokkaido Colonization Bank, Central Bank for Co-operative Societies and Chosen Industrial Bank in hand. These mortgage debentures must be redeemed by means of drawings taking place at least twice a year in amounts proportionate to the amount to be redeemed in the same year of the loans redeemable by annual instalments and the debentures of the above-mentioned banks in hand. In case any loans redeemable by annual instalments are repaid before they are due, the bank may with the amount so paid purchase and redeem its mortgage debentures. The present president of the bank is Dr. Eiichi Baba.

Agricultural and Industrial Banks (Noko Ginko)

The Agricultural and Industrial Banks are prefectural financial institutions for accommodating provincials with long-term loans at a low rate of interest on security of immovable property and, being established in every prefecture, are most useful through their connection with their central institution, the Hypothec Bank of Japan. But with a view to affording further financial facilities to local districts, the law concerning the amalgamation of the Hypothec Bank and the Agricultural and Industrial Banks was enacted in 1921. By virtue of this law the former was allowed to take over the business of the latter on condition that it established its branches in places where head offices and branches of the latter were in existence. The Agricultural and Industrial Banks are joint-stock companies, each having a capital of not less than ¥200,000. Each of these banks has as a general rule for its exclusive business district a prefecture. The business of the Agricultural and Industrial Banks is principally the same as that of the Hypothec Bank of Japan. These

Digitized by Google

banks may become agents for the Hypothec Bank or other Agricultural and Industrial Banks. When acting as agents for loans made by the Hypothec Bank, Agricultural and Industrial Banks may guarantee to the bank the solvency of the debtors. They may take charge of the receipt and disbursement of the funds of prefectures or cities. These banks are authorized, when at least one-fourth of the nominal capital has been paid up, to issue agricultural and industrial debentures to an amount not exceeding fifteen times the paid-up capital. Such debentures, however, must not exceed the amount remaining after the deduction of the amount of pledges given for money borrowed from the Hypothec Bank from the total amount of outstanding loans redeemable by annual instalments and at a fixed time. There were 19 of these banks in existence throughout the country at the end of 1933.

The Industrial Bank of Japan
(Nippon Kogyo Ginko)

The Industrial Bank of Japan was founded in April, 1902. Its authorized capital is ¥50,000,000 fully paid up. Its business is as follows:

(1) To make loans on pledges of national and prefectural bonds and company debentures and shares;

(2) To subscribe for or underwrite national and prefectural bonds and company debentures;

(3) To receive deposits of money and accept articles of value for custody;

(4) To engage in trust business for mortgage debentures;

(5) To discount bills;

(6) To engage in the business of bills of exchange and documentary drafts;

(7) To make loans on security of foundations created as subscribed by law;

(8) To make on mortgage of ships or ships under construction loans which shall be redeemable by annual instalments within a period not exceeding 15 years, or at a fixed time within a period not exceeding five years;

(9) To make loans on security of shipbuilding materials or equipment;

(10) To subscribe for or take up shares which have been approved by the Minister of State concerned;

(11) To subscribe for national or provincial bonds and company debentures, or to act as agent for receiving these instalments payable by general subscribers or paying principal and interest and dividends;

(12) To make call loans for a fixed term on security of sites and

Digitized by Google

buildings belonging to factories or of residential land or buildings lying in localities where the City Organization Law is in force or in city land to be designated by Imperial Ordinance, provided, however, that the total amount of such loans shall not exceed two-thirds of the amount of paid-up capital; and

(13) To purchase national or provincial loans or company debentures and shares or gold and silver bullion with available money which the bank may employ for the purpose.

The bank is authorized to issue debentures to an amount not exceeding ten times its paid-up capital, provided, however, that the amount of such debentures shall not exceed the total amount of outstanding loans, discounted bills, and national or provincial bonds, company debentures, shares and gold and silver bullion in hand. Only in the event of funds being required for enterprises for public benefit undertaken in a foreign country, the bank may, with approval of the Minister of Finance, issue debentures irrespectively of the above-mentioned restriction. The bank played an important part in overseas investment. The first of this kind was that in public utilities and loans to private enterprises in Korea in 1906. The bank also became active in investments in China, not only making direct investments, but also indirectly through the Toa Industrial Development Company, Chunichi Industrial Development Company and Chukwa Exchange Bank. One of the most notable investments of the bank was its "political" loans to China in 1918. Loans also were made to Japan's industrial developments in the South Seas. The bank underwrote loans for the Russian and French Governments and also subscribed for shares of the Franco-Japanese Bank and Chukwa Exchange Bank, Peiping, in connection with the establishment of these institutions. The bank features in engaging in trust business in mortgage debentures. Through financial accommodation of the Deposits Bureau of the Ministry of Finance, the bank lent, for industrial rehabilitation, the first-aid loans to districts devastated by the Kanto earthquake and fire. Mr. Toyotaro Yuki is president.

The Hokkaido Colonial Bank

(Hokkaido Takushoku Ginko)

The Hokkaido Colonial Bank was established with the object of supplying capital for enterprises for colonizing and developing Hokkaido and Karafuto (the Japanese half of Saghalien), and especially for the purpose of facilitating the supply

Digitized by Google

of capital by making loans on security of agricultural products and company shares and debentures as well as making long-term loans at low interest rate on immovable property. The bank had at first a capital of ¥3,000,000, but on April 23, 1922, it was increased to ¥20,000,000, of which ¥12,500,000 has been paid up. The business scope is very much similar to that of the Hypothec Bank of Japan and the Agricultural and Industrial Banks. The bank is authorized to issue debentures of not less than ten yen face value to an amount not exceeding 15 times its paid-up capital. Such debentures, however, must not exceed the total amount outstanding of the loans which are redeemable by annual instalments or at a fixed date, and when debentures of not more than twenty yen face value are to be issued by the bank, such issue may also be effected by sale. These debentures must be redeemed by means of drawings at least twice a year in amounts proportionate to the amount of the said loans to be redeemed in the same year.

The Bank of Taiwan
(Taiwan Ginko)

The Bank of Taiwan was founded in September, 1899, four years after Japan's occupation of Formosa, as the result of the Sino-Japanese War. It was capitalized at ¥5,000,000, when it opened. The bank was brought into being largely through efforts of the then Minister of Finance Masayoshi Matsukata, and was given the privilege of issuing notes for circulation in the island. In 1910 its capital was increased to ¥10,000,000, which was doubly increased in 1918. The bank served as the most influential financing organ not only for the island's principal industries such as rice, sugar, camphor, tea, coal and gold, but contributed a great deal toward Japanese industrial development in South Seas countries and business activities in South China. Its reckless business expansion during the World War resulted in a tie-up of a large amount of loans, when the financial panic of 1920 took place. After 1922 the business sphere was narrowed. The great earthquake and fire of 1923 caused the collection of loans difficult. The bank wrote off ¥28,600,000 of its bad assets for the first half of 1925 and partially made good the loss by means of its reserves. In addition, it carried out a reduction of capital by ¥15,000,000. This was not enough. A bill providing for financial aid to the bank was adopted by the Diet and, consequently, the bank was accorded financial accommodation by the Bank of Japan. In November of the same

Digitized by Google

year it further cut its capital by ¥30,000,000. Readjustment has been progressing since then. Mr. Jiro Yasuda is its president.

The Bank of Chosen
(Chosen Ginko)

The Bank of Chosen was established in March, 1911, by virtue of the Bank of Chosen Act issued by the Government following Korea's annexation to Japan in April, 1910. The bank took over the assets and liabilities of the Bank of Korea, which was founded in October, 1909, following the transfer of the assets and liabilities of the Dai-Ichi (First) Bank. The bank is authorized to issue bank notes. In 1917 the bank's notes were given sole right of legal tender in the Kwantung Leased Territory and along the South Manchuria Railway, and the limit of its guaranteed note issue was increased to ¥50,000,000. The bank greatly increased its activities during the World War and expanded its business sphere to Japan proper, where it commenced foreign exchange business. The financial reaction following the World War caused it to narrow its business activities. It wrote off frozen assets to the amount of ¥36,000,000 for the first half of 1925 and halved its capital to ¥40,000,000. The bank borrowed a large amount of money from the Bank of Japan after 1920 on 10 years' repayment. Through revision of the Bank of Chosen Act in 1924 the right of control of the bank was transferred from the Governor-General of Korea to the Minister of Finance. The bank was unable to collect call loans in connection with the 1927 financial panic, but the extent of harm received was not so severe as that of the Bank of Taiwan.

Financial Panic of 1927

The financial panic that overtook Japan for about a month from the middle of March, 1927, was an unprecedented affair in Japan's financial circles. This incident brought about a revolutionary change in the Japanese financial system and a great banking readjustment followed it during the next year. The financial panic may be divided into three stages. The first period extended from the closing of the Tokyo Watanabé Bank and its sister institution, the Akaji Savings Bank on March 15 to March 23, when the so-called earthquake and fire readjustment bills were adopted by the Diet. The second period was marked by the progress of financial uncertainty spreading over all Japan and lasted from the time of the adoption of the bills to the middle of April. The third period was featured by the opposition raised by the Privy Council against an urgent Imperial Ordinance for the relief of the Bank of Taiwan, when it was submitted to the Council, and the subsequent development of the situation was one of uncertainty in which the financial condition went from bad to worse until, on April 22, a moratorium was enforced throughout the country, to last for 3 weeks.

The Reaction of 1920 The financial panic had sundry causes before it really came to a head. When the financial reaction of 1920 overtook Japan, the country stood in need of carrying out thoroughgoing readjustments. Comparing prices of commodities in 1914 with those in 1920, the average index number was 338 on the basis of 100 taken in 1914. Soon after the financial panic the index number fell back to 280 and this declining trend lasted until the subsequent low point of 180 was

Digitized by Google

reached just before the 1927 panic. This heavy drop of prices dealt a severe blow to economic circles. By the drop in the value of mortgages, banks were given no little blow. Refunding of loans advanced became difficult and this caused many banks to incur losses. Following the 1920 reaction no readjustment was carried out.

The Quake-fire The Kwanto earthquake and fire of 1923 aggrandized the losses of banks. Bankers realized that thoroughgoing readjustment was unavoidable, but they lacked enough courage to carry out the reduction of capital or take other drastic steps, fearing loss of public credit. The shiftlessness of the bankers as the economic condition grew worse, aggravated the situation. When the relief bills, that is, the Earthquake and Fire Bill, Readjustment Bill and the Earthquake and Fire Loss Indemnification Bond Bill, were submitted to the 52nd session of the Imperial Diet on January 26, 1927, they provoked a great discussion in the Diet. In debating these bills, interpellations and answers exchanged on the Diet floor went too far, exposing in some cases the weak status of many banks, but on the whole this Diet debate allayed the uneasiness of depositors regarding the credit of the banks. Through a slip of the tongue on the part of Mr. Naoharu Kataoka, the then Minister of Finance, irregularities of the Tokyo Watanabé Bank were exposed to the Diet on March 14. The bank had made a large amount of loans to various business enterprises in which directors of the bank were interested, and the refunding of loans had become difficult. On March 15, the bank had to close its doors and it was similarly followed by its subsidiary institution, the Akaji Savings Bank. This proved an incident leading to the outburst of the great financial panic that ensued. Damaging rumours ran fast and runs on banks increased. On April 19, the Nakai Bank, Tokyo, suspended its business, and on April 22, four second-class ordinary banks in Tokyo and Yokohama, such as the Soda, Eighty-fourth, Nakazawa and Murai banks, closed their doors and announced business readjustments. The total amount of deposits of these six banks reached about ¥200,000,000. Because of the fact that depositors were mostly medium-sized business shops of Tokyo, the extent of damage was fairly wide. Inter-bank transactions were carried on only with great caution and call loan deals were nearly suspended. Instead, many banks asked for loans from the Bank of Japan. As the result of negotiations between representatives of large ordinary banks and the Bank of Japan, the latter finally decided to make emergency loan advances to relieve the situation. A joint statement of the Minister of Finance, Vice-Minister of Finance, and Governor of the Bank of Japan was issued on April 22, declaring that financial stabilization would soon be attained. The two post-earthquake and fire readjustment bills were meanwhile adopted by the House of Peers.

The Bank of Taiwan The panic by that time was mostly confined to banks in Tokyo and Yokohama, because of the fact that it was directly caused by earthquake bills. Effects on the stock market were not very severe, except for shares connected with the closed banks. However, the miserable plight in which one of the special banks, the the Bank of Taiwan, found itself in April, intensified the financial uneasiness. The disposal of earthquake bills held by the Bank of Taiwan was made an object of

Digitized by Google

scathing criticism by the public. In accordance with a decision of the House of Peers that a Bank of Taiwan Investigation Commission should be organized, the Wakatsuki Cabinet appointed the members. The first thing done by the commission was to instruct the bank to suspend dealings with Suzuki Shoten, Kobé, on which responsibility mostly rested for the bank's present awkward predicament. New loan making to this great trading concern in Kobé was entirely suspended by the bank. This gave a great shock to Japanese economic circles, because this concern carried on business in a wide sphere, having more than 60 large and small business houses under its control. To the Bank of Taiwan alone the Suzuki's owed the enormous amount of ¥350,000,000. It was greatly feared by the public that the prohibition of new loans to the Suzukis might mean the eventual failure of the Bank of Taiwan. All banks making call loans to the bank began withdrawing loans and this was followed by an active run of depositors on the bank. No matter how strenuously the Government explained that the bank was quite safe it was not heeded by depositors. Business became more difficult daily and the situation forced the bank to ask the Government and Bank of Japan for relief. During the intervening period runs on banks in a mild form spread all over the country. The financial uncertainty grew steadily intense and this resulted in a sudden outburst of great confusion on the stock exchanges. When the Sixty-fifth Bank of Kobé, in which Suzuki Shoten was heavily interested, announced business suspension on April 8, the stock markets of Tokyo, Osaka and other cities were literally thrown into a chaotic condition.

The Cabinet Resigns The aggravation of Sino-Soviet diplomatic relations and a clash of Japanese and Chinese soldiers in Shanghai brought further uneasiness to a turbulent market. The Government was very much concerned that the Bank of Taiwan situation had increased to such serious proportions and debated on relief measures. In consequence, an emergency loan advance by the Bank of Japan and the consequent issue of an urgent Imperial Ordinance for indemnification against loss for the Bank of Japan were approved at an extraordinary Cabinet meeting of April 13. The urgent Imperial Ordinance was submitted to the Privy Council on April 15. The bill provided for the Bank of Japan indemnification against loss to the amount of ¥200,000,000 against its unsecured loans to the Bank of Taiwan. A vigorous opposition was raised by the Privy Council against the urgent Ordinance on the reason that the action of submitting such an important bill within less than two weeks after the closing of the Diet was indiscrete and irresponsible. At a plenary session of the Council on April 17 the bill was shelved. The Wakatsuki Cabinet had to resign as the result. The situation threw financial circles into utter chaos. The Bank of Japan and other large banks could render no more relief to the bank. Eventually the bank closed the doors of its head office and all branches on April 18. On the same day the Omi Bank, one of the influential banks of Osaka, announced the closing of its doors. Financial confusion reached its height. Runs on banks spread throughout the country. One of the Big Five ordinary banks of Tokyo, the Jugo (Fifteenth) Bank, closed its doors on April 21. Foreseeing further spread of panic, all banks in Tokyo voluntarily closed their doors for two days, on April

Digitized by Google

22 and 23, to prepare against the runs.

A Moratorium Proclaimed By this time the Tanaka Cabinet had replaced the Wakatsuki Cabinet. A three weeks' Moratorium was proclaimed by the new Cabinet and the urgent Imperial Ordinance was adopted by the Cabinet on April 22. During the time that the moratorium was in force maximum payments were limited to ¥500 per day. An extraordinary Diet session opened for five days commencing May 3 to decide on relief measures. The Bank of Japan Special Loan Bill and Taiwan Financing Organ Relief Bill were submitted to it by the Government. This pacified the turbulent popular mind and the great financial panic came to a halt on April 22 with the enactment of the moratorium.

At that time the total deposits held by ordinary banks were estimated at ¥9,000,000,000, but it was unknown how much of the deposits were withdrawn by the public. Banks closed in connection with the panic were 30, of which 10 were in Tokyo, 3 in Osaka and 17 in other districts. The total deposits in these closed banks were ¥770,000,000 at the end of 1926. Loans of the Bank of Japan, which were about ¥200,000,000 about the middle of March, increased to more than ¥2,000,000,000 on April 20. The highest amount of note issue of the Bank of Japan during the panic was recorded at ¥2,600,000,000. The yen-dollar exchange rate fell back to $46¼ during the crisis. The two relief bills were passed by the Diet on May 8. The bills provided for loss indemnification to the amount of ¥500,000,000 for the Bank of Japan in its financial relief in Japan proper and ¥200,000,000 for the same bank in its relief measures to financial organizations in Formosa. The Bank of Taiwan resumed business on May 9. In both cases the Bank of Japan had to grant loans and the Government guaranteed its loss against these to the maximum amount of ¥700,000,000. The special loans made by the Bank of Japan before the maturity of the one year term of the guarantee, that is, May 8, 1928, amounted to ¥879,000,000, of which ¥687,000,000 was lent to banks in Japan proper and ¥191,000,000 to banks in Formosa. Altogether 90 banks received special loans from the Bank.

Trust Business

It was about 1906 that companies bearing the title of trust companies were first established in Japan, and, since that time the number of these institutions has steadily increased. This has been especially due to the unusual economic activity resulting from the World War and promotion of various new enterprises. The Government laid the projected Trust Law and Trust Business Law before the 45th session of the Imperial Diet and secured its approval. These two laws were effective on and after January 1, 1923. The gist of the Trust Business Law is as follows:

(1) Trust business can be carried on only by a joint-stock company whose capital is one million yen or more and which has obtained a licence from the Minister of Finance.

(2) Though the proper function of trust companies is not definitely laid down in law, it is clear that they are expected to act as trustees for the benefit of other parties, i. e., they must, with the intention of faithful managers, administer or dispose of the right of property established or transferred by the beneficiary for the benefit of the beneficiary or a third party. The properties that a trust company can

Digitized by Google

accept in trust are limited to the following items: money, negotiable paper, monetary claims, movables, land and things thereon, and superficies and leases of lands.

(3) The method of administering the trust property is specified in the Imperial Ordinance issued according to the provisions of the Trust Law.

(4) Business which trust companies can carry on as incidental to their main business are limited to the following:

(a) Reception of deposits for safe custody;

(b) Giving guarantees for debts;

(c) Acting as an intermediary in the sale of immovable properties;

(d) Acting as an intermediary in the loans of either money or immovable properties;

(e) Floatation of bonds, debentures or stocks, and receipts of payment from the subscribers;

(f) Payment of principal and interest or dividends of bonds, debentures or stocks;

(g) Execution of a will concerning property;

(h) Auditing;

(i) Acting as agents for the following matters: Acquisition or disposition of properties; Acquisition and liquidation of properties; Collection of claims; Performance of obligations.

Of the above, the guaranteeing of debts is subject to necessary limitation to be specified by Imperial Ordinance.

(5) Trust companies are forbidden to engage in any business other than those mentioned above, excepting business connected with secured debentures.

(6) Trust companies must in conformity with the provisions of ordinance, deposit national loan bonds of not less than one-tenth of their capital as security, and beneficiaries are entitled to preferential rights as regards the national loan bonds thus deposited by trust companies. The rate of legal reserve fund has also been increased, while a certain limit is to be observed by the companies in using their own funds for the purpose of investment. These, together with other provisions for control, are intended to protect the interest of beneficiaries, at the same time preventing the companies from possible mismanagement.

(7) As stated in (5) the companies carrying on general trust business can also engage in similar business connected with secured debentures. Consequently, a revision was effected in this respect in the Secured Debenture Trust Law. Ordinary banks were formerly disqualified from carrying on a general trust business, but this privilege was allowed to the Bank of Taiwan, Industrial Bank of Japan and Hokkaido Colonization Bank. It being deemed necessary to confine the operation of these special banks in the particular line to business connected with secured debentures only, necessary revisions have been made in the laws relating to these banks.

Trust companies established under the provisions of the above-mentioned trust laws numbered 36 and had an aggregate nominal capital of ¥287,000,000 at the end of December, 1933. Before the enactment of the law there were about 500 "trust" companies, most of which were eliminated with the enactment. About 37 trust companies are carrying on business, and several of them, such as the Mitsui, Mitsubishi, Yasuda and Sumitomo trust companies, are run by Japan's wealthy families. Details concerning the trust companies in this country are given below:

Mutual Loan Companies (Mujin Kaisha)

In addition to the banking institutions, there are at present mutual loan companies (Mujin Kaisha), which are credit establishments peculiar to Japan and are based on mutual credit among the middle and lower classes of people. Mutual credit societies have existed in Japan since olden times. The Mutual Loan Society Law was promulgated in June, 1915, whereby the mutual loan societies acquired a legal standing. In order, however, to enable these societies to perform the function of a financial institution for lower classes and to extend their business operations, fundamental amendments were made in the law in 1931. According to the provisions of the Mutual Loan Company Law, put into effect on and after July 1, 1931, the business of the companies is to make the subscribers pay money in instalments during a fixed period and then to distribute it, in lots, among the subscribers, by drawings, biddings or some similar means, the number of such lots and the sum of money to be thus distributed being previously fixed. Each company must have a nominal capital of more than ¥30,000 and a paid-up capital of more than ¥15,000. No company is allowed to carry on this kind of business without permission of the Minister of Finance. Those so engaged are prohibited from carrying on any other business at the same time and are under obligation to present business reports to the Government. Restrictions also are put on the use of business funds. At the end of 1932 there were 274 Mujin companies with an aggregate of ¥37,665,500 in authorized capital and ¥18,272,199 in paid-up capital. Details bearing upon the status of these companies are found in the following table:

Co-operative Credit Associations

Credit Associations acquired a legal standing under a new system as defined by the so-called Co-operative Association Law, promulgated in March, 1900. The business of these associations is to lend money to their members in order to better their economic conditions and to employ their savings. By virtue of the revision of the law in July, 1917, the business of the Credit Associations has been expanded and they may use the savings of the families of their members, public corporations or legal persons who do not aim at profit. Especially, the Credit Associations in cities or city areas designated by the competent Minister of State may, besides the business above described, discount bills for their members and handle savings of persons who are not their members but reside inside the same boundary. Therefore, they may be called the People's Banks in city areas, and are placed under the control of the Minister of Finance and Minister of Agriculture and Forestry. The actual number of these associations was 266 at the end of December, 1933.

Central Chest for Co-operative Associations

(Sangyo Kumiai Chuo Kinko)

As an institution for regulating the movement of funds of the Federations of Co-operative Associations and of individual Co-operative Associations and for bringing them into close touch with the central money market, the Central Chest for Co-operative Associations was established by law on April 5, 1923. Its capital at present amounts to ¥30,700,000, of which ¥15,000,000 is invested by the Government and the remainder, ¥15,700,000, by the Co-operative Associations throughout the country. The Associations that participated in the investment amounted to more than 80 per cent. of the total number existing. The principal business of the Central Chest for Co-operative Associations is as follows:

(1) To make without security loans redeemable at a fixed time within a period of not more than five years to Federations of Co-operative Associations or Co-operative Associations;

(2) To make loans without security redeemable by annual instalments within a period not exceeding thirty years to the Federations of Co-operative Associations or Co-operative Associations, provided that the total amount of such loans does not exceed one-half of the paid-up capital and debentures issued;

(3) To discount bills for, or allow overdrafts to, Federations of Co-operative Associations or Co-operative Associations;

(4) To undertake exchange business for Federations of Co-operative Associations or Co-operative Associations;

(5) To receive money as deposits from Federations of Co-operative Associations, public corporations, or legal persons not engaged in business aiming at profit;

(6) To take securities for safe custody for Federations of Co-operative Associations or Co-operative Associations; and

(7) To buy and sell on a consignment basis securities for Federations of Co-operative Associations or Co-operative Associations.

The Central Chest is authorized to issue debentures and is subject to control both of the Minister of Agriculture and Forestry and Minister of Finance. The assets and liabilities of these associations follow:

The Big Six

In the commercial banking world, of non-governmental banks there are six which stand out from all the others in importance, these are the Mitsui, Mitsubishi, Dai-Ichi, Sumitomo, Yasuda and Sanwa, the last named was created by the amalgamation of three banks, i. e. Konoike, Yamaguchi and the 34th in December, 1933. A table of comparative statistics at the end of 1934 follows ; figures are in ¥1,000 :

	Mitsui	Mitsubishi	Daiichi	Sumitomo	Yasuda	Sanwa
Authorized capital	100,000	100,000	57,500	70,000	150,000	107,200

Clearing Houses

The establishment of the first clearing house in Japan took place in Osaka in 1879, preceding by eight years that in Tokyo, where one was established in 1887. Cash transactions marked the commercial society of this country early in the Meiji era and no transactions in bills or cheques were then conducted. Viscount Shibusawa and other business leaders encouraged paper transactions among business men at large and the time soon came when it was necessary for Tokyo to establish a clearing house, one being eventually brought into existence by the Bankers' Association in 1887. The first president of the institution was the late Viscount Shibusawa and the present holder of that office is Mr. Manzo Kushida, Chairman of the board of directors of the Mitsubishi Bank. In June, 1934, there were 43 clearing houses in Japan. The total of bills cleared at the clearing-houses throughout the country in the year 1933 reached 36,785,658 bills and ¥66,771,199,000, which are pretty near to the records of 1928 and 1929. As compared with the preceding year the number of bills increased by 2,645,000 (7.7%), while the amount gained was ¥14,073,000,000 (26.7%). The amount of clearings in Tokyo and Osaka and All-Japan were as follows :

Postal Savings Deposits

The postal savings deposits system of Japan was adopted from the Post Office Savings Act of Great Britain. It was established by an Imperial Ordinance of August, 1874, and was enforced in May of the following year at 22 post offices in the country. The history of this service in Japan is one of the oldest in the world, older than that of Germany or France and 36 years older than that of America. At first the annual interest rate was 8 per cent., the same as at present, which has been enforced since October 1, 1932. The maximum amount one could deposit was at first ¥500. In the first year of enforcement the amount totalled ¥15,224 for 1,843 depositors. In 1882 the Mail Act was passed and the deposit business became jointly controlled by the Minister of Finance and Minister of Agriculture and Commerce. The service was looked after by 4,000 post offices in the country. In 1890 the Postal Savings Deposit Act was issued. In 1920 the Exchange Deposit Bureau was established and was later replaced by the Deposit Bureau in the Ministry of Communications. (See Chapter VIII.)

The number of depositors and amount of savings since 1925 have been as follows:

March 31,	Total Number	Total Amount
1925	30,386,806	¥1,181,250,271
1926	31,549,989	1,166,908,703
1927	32,410,752	1,253,589,935

1929	36,485,875	1,863,703,742
1930	37,968,850	2,201,245,552
1931	38,257,981	2,497,154,253
1932	39,066,040	2,815,868,019
1933	35,020,351	2,679,065,760
1934 (estimate)	37,765,173	2,748,620,646

Currency System

Coinage The present coinage system is based on the Coinage Law, issued in 1897, which established the gold monometallic system. Its principal points are summarized as follows:

(1) The coinage unit is 2 fun (0.75 grammes) of pure gold, that is, one-half of the former gold unit, and is to be denominated one yen.

(2) The standard gold coins are of three denominations, namely, five yen, ten yen and twenty yen; the former gold coins pass for double their nominal value.

(3) The subsidiary silver coins are of two denominations, namely, twenty sen and fifty sen; the former

Digitized by Google

five-sen, ten-sen, twenty-sen and fifty-sen silver pieces are allowed to circulate.

(4) The other subsidiary coins are the nickel five-sen and ten-sen pieces and the bronze one-sen and five-rin pieces; the former five-sen nickel as well as two-sen, one-sen, five-rin and one-rin copper pieces are allowed to circulate.

(5) The fineness and weights of the coins prescribed in the Coinage Law are as follows:

(a) Fineness

Gold coins	pure gold 900	Copper 100
Silver coins	pure silver 720	Copper 280
Nickel coins	pure nickel 1000	
Bronze coins	copper 950	Tin 40 zinc 10

(b) Weights

Gold coins:

Denominations	Weights Grammes
20-yen pieces	16.6666
10-yen pieces	8.3333
5-yen pieces	4.1666

Subsidiary coins:

Denominations	Weights Grammes
50-sen silver	4.95
20-sen silver	1.98
10-sen nickel	4.00
5-sen nickel	2.80
1-sen bronze	3.75
5-rin bronze	2.10

Paper Notes of Small Denominations In order to make good the deficiency of subsidiary silver coins caused by the war, paper notes of small denominations, namely, fifty-sen, twenty-sen and ten-sen, were issued as a substitute in accordance with the Imperial Ordinance No. 202 promulgated on October 29, 1917. The issue of these petty notes went on increasing in volume till at the end of February, 1922, it reached 218 million yen, the largest on record. After that time the volume gradually dwindled in consequence of the minting of new subsidiary coins to displace the notes, the latter coming down, by the end of December, 1932, to ¥11,380,000, consisting of ¥5,649,000 50-sen notes, ¥1,123,000 20-sen notes and ¥4,608,000 10-sen notes.

Convertible Bank Notes In May, 1884, there was promulgated the Convertible Bank-notes Law providing for the issue by the Bank of Japan of bank-notes which were to be converted into silver, but on the adoption of the gold standard in 1897, these notes became convertible into gold. Certain amendments were, however, made in the law in June, 1932, and put into effect on and after July 1. The principal points may be summarized as follows:

The Bank of Japan is required to hold as a conversion reserve against the issue of notes gold and silver coins and bullion to the same amount as that of the notes issued; and the total value of silver coins and bullion must not exceed one-fourth of the entire conversion reserve. The Bank of Japan may, in addition to the notes specified in the preceding paragraph, issue bank-notes to the amount of ¥1,000,000,000 against Government bonds, Treasury notes and other reliable securities or commercial bills. The Bank may also be allowed to issue notes against such securities beyond the maximum mentioned above. In case the issue in excess of this limit lasts more than 15 days, however, the approval of the Minister of Finance is required, and such issues outstanding after a period of 15 days are subject to a tax of at least 3 per cent. per annum of the amount so issued. The bank-notes are of 7 denominations, namely, one yen, 5 yen, 10 yen, 20 yen, 50 yen, 100 yen and 200 yen.

Currency System of Formosa and Korea As regards the currency system of Formosa, up to October, 1908, recognition was given to the circulation at the market price in gold of

Digitized by Google

the silver yen, similar to that in circulation in Japan proper until the revision of the Coinage Law in 1897; but the exchange of silver was brought to a conclusion at the end of April, 1909, and in the same month of 1911, the Coinage Law of the Empire was brought into operation in the island, so that the system in Formosa is now absolutely identical with that in force in Japan proper. The Bank of Taiwan issued, at first, bank-notes convertible into silver yen, but these notes were, upon the reform of the currency system, withdrawn from circulation by April, 1909. In June, 1904, the bank was allowed to issue bank-notes convertible into gold coins, holding as conversion reserve gold and silver coins and bullion to the same amount as that of notes issued. It may further issue notes to the amount of ¥20,000,000 on security of reliable securities. Should it be necessary to issue notes over and above the amounts just mentioned, the permission of the Government must be obtained and an issue-tax of not less than five per cent. must be paid in respect of the excess issue.

The currency system of Korea had fallen into such a state of disorder and confusion that the credit of legal tenders was entirely gone, and consequently commodity prices perpetually fluctuated. In 1905, at the time of the protectorate régime of Japan, a radical reform of the system was started, the coinage regulations were revised and new coins equal in quality and weight to those of Japan were minted. At the same time, the use of the old nickel coins was prohibited on and after December 31, 1909. After the annexation (1910), with the object of unifying the coinage of Korea with that of the Empire, the minting of coins under the Coinage Regulation was suspended and the circulation of Japanese coins was encouraged; the old Korean coins in circulation steadily diminished. The Imperial Coinage Law was put in force in April, 1918 in Korea and the use of the old Korean coins as legal tender was permitted till the end of 1909 only, the Government undertaking to exchange them during the five subsequent years. The use of "Yo-sen" (bronze pieces), however, was left free for the time being in consideration of economic conditions in Korea. Bank-notes issued by the Bank of Chosen are convertible notes. Besides issuing, under the Charter of the Bank of Chosen, on the security of gold specie, gold and silver bullion and the Bank of Japan's convertible notes, the bank is authorized to issue notes up to the limit of ¥50,000,000 on the security of exchequer bills and other reliable bills or trade bills.

The Gold Embargo, Its Removal and its Replacement*

Japan went off gold on September 12, 1917, alive to the prevailing situation, in which almost all the important countries departed from gold. It was shortly after the departure of the United States from the gold standard, in September of the same year that it entered the World War, that Japan went off gold. Japan's gold embargo was enforced with the issue of Regulation No. 28 of the Ministry of Finance.

Removal Temporary Japan was off gold for 12 years. When, however, the Hamaguchi Cabinet came into being in July, 1929, the Cabinet included, as one of the important planks of its platform, the removal of the gold embargo, and on November 21 announced the lifting as from January 11, 1930. This removal, however, proved to be only temporary, for in less than two years, with the coming into power of the Inukai Cabinet, the embargo on the export of gold was reimposed, on December 13, 1931. When the gold embargo was removed in January, 1930, the Bank of Japan held a specie reserve of more than ¥1,000,000,000, which dwindled to as low as the ¥400,000,000 mark at the end of 1931, shortly after the replacement of the gold embargo, and at present the unfortunate position is that Japan has no specie reserve abroad, making it impossible for Japan to remove the gold embargo in the future at anywhere near parity.

* For fuller information see the Japan Year Book, 1933.

The Money Market

In 1933 As regards the money interest rate in 1933, the highest was 5.3 per cent. per annum for the fixed deposit in the first half term, viz. from January to June, and the lowest 4.6 per cent. The highest rate for loan on securities was 10.9 per cent. and the lowest 6.9 per cent. The highest discount rate was 2.69 sen and the lowest 1.89 sen per day per ¥100. In the second half term, viz. from July to December, both the highest and the lowest interest rate for the fixed deposit was reduced by 0.3 per cent., and also the lowest rate on loan on securities was reduced by 0.2 per cent., while there was no change in the highest. The discount rate was also reduced by 0.09 sen in the highest and by 0.05 sen in the lowest. Both the highest and the lowest rates were lower than the previous year.

The average quotation in 1933 of foreign exchanges quoted by the Yokohama Specie Bank was for cable transfer on New York $25.25 for ¥100, on London 1/2.5d for ¥1., on Paris 5.07 fr., on Shanghai ¥106.88

Digitized by Google

for 100 tl., and on Bombay 79.63 Rs. for ¥100, which showed a decline of yen as compared with the previous year. In January of the same year, quotations were on New York $20.75, on London ½.8d., on Paris 5.24 fr., on Shanghai 71.85 tl., and on Bombay 80.50 Rs. In December, they were $30.25, ½.1d., 4.95 fr., ¥110.75 and 78.75 Rs. respectively.

In 1934 Increase of deposits and the increasing difficulties in finding proper outlets for the swelled deposits were its features in the last three years. According to the investigation of the Ministry of Finance, at the end of December, 1934, deposits in the ordinary city banks reached ¥9,300,000,000, an increase of ¥500,000,000 compared with 1933 and of ¥1,300,000,000 compared with 1932. Meantime, fresh demands for advances and bill discounting were sparse. Business corporations were in fashion of trying to obtain needed capital by means of issuances of debentures. The percentage of discounts and advances against deposits became lower and lower. It dropped from 82% of the end of 1931 to 44% at the end of 1934, the total excess of deposits then reaching ¥1,500,000,000 to ¥3,100,000,000. The only resort banks could appeal to was the purchase of bonds. Thus the holdings of banks of liquidable notes and public bonds increased by leaps and bounds and finally up to ¥4,000,000,000, 41% of the total deposits.

DEPOSITS, ADVANCES AND SECURITY HOLDINGS OF ORDINARY BANKS THROUGHOUT JAPAN (¥1,000,000)

	Deposits	Advances	Security Holdings
Dec., 1931	8,269	6,749	2,929
Dec., 1932	8,819	6,602	2,929
Dec., 1933	8,727	6,344	3,305
Feb., 1934	8,812	6,452	3,513
Apr., 1934	8,950	6,333	3,870
June, 1934	9,144	6,269	3,904
Aug., 1934	9,084	6,117	4,046
Oct., 1934	9,025	6,165	4,038
Dec., 1934	9,335	6,239	3,872

General condition such as mentioned above necessitated the money rate remaining continuously and increasingly slow and low which had necessitated the lowering of interest on deposits, with the result that the member banks of the Clearance Houses lowered it to 4% per annum as from June, 1934. Call money was also cheap during the first half of 1934, but as the payments for shares and bonds subscribed increased following the progress and execution of extension schemes of various productive industries and the purchases of Government bonds by banks increased, the short call money became steadily stiffened. The worsened economic condition of agricultural communities and the resultant shattering of industrial shares only served to aggravate the stiffening condition of money markets. But as a whole the money rate remained at a low level compared with 1931.

TREND OF MONEY RATE IN TOKYO

(Sen per day)

	Commercial Bills	Index	Call (in the day following)	Index
1931	1.158	100	0.900	100
1932	1.419	123	1.183	132
1933	1.057	93	0.690	77
1934	1.039	92	0.683	76

Digitized by Google

According to the investigation of the Hypothec Bank of Japan the total amount paid up into bonds, debentures and stocks during 1934 was ¥4,729,000,000 which was about ¥700,000,000 less than in the previous year. But this was due to the decrease in the Government bonds. As for corporation debentures and shares, the total of the two showed an increase of ¥380,000,000, or in 1933 about 50% was Government bonds, being a double amount of corporation debentures, but in 1934 Government bonds were reduced by ¥1,000,000,000 and corporation debentures gained ¥250,000,000 and shares ¥130,000,000. This is why the percentage of Government bonds became so small as 36%.

PAYMENTS INTO BONDS, DEBENTURES AND SHARES

(¥1,000)

	1932	1933	1934
National Bonds	1,374,181	2,728,343	1,717,808
Prefectural Bonds	97,026	743,372	710,916
Corporation Debentures	448,836	1,488,007	1,722,149
Shares	149,634	448,834	577,868
Total	2,069,677	5,408,555	4,728,742

A great portion of the corporation debentures was either for conversion to cheaper rated ones or for consolidation of running debts. It is not, therefore, in the debenture floatation, but in the increased payments for subscribed shares that the bright prospects of the enterprising industrial world was well reflected. As for the issuance terms, the ruling rate throughout 1934 was 4% for Government bonds and 4.3% for prefectural bonds and special banks and first rated industrial debentures.

Stability of Foreign Exchanges Exchange markets of the world which experienced tremendous disturbances in 1933 following the gold embargo in the United States recovered their normal conditions by January, 1934, when the American Government announced and executed its dollar devaluation programme. The dollar exchange in Japan also followed the world current toward stability. Meantime, the setting aside of $2,000,000,000 as the exchange settlement fund and the adoption of Governmental ownership of gold in the United States served as salutary actions for the wiping out of all causes of uneasiness and unstability. This setting up of the exchange settlement fund in the United States and the similar action taken in England led to the quick restoration of stability in the cross rate, and following it the Yokohama-New York exchange remained quite stable at 29-30 throughout the year 1934, the average rate in that year being 29.69 in contrast to 25.39 of the previous year. At the end of 1934 it was 50% higher than in the corresponding period of 1933. But the price level in the United States improved during the same period from 78 to 109 which of course counteracted on the American trade of Japan against the latter's interest. During all this period the exports of silk experienced a sharp drop, which, however, can not be attributed only to the so much restoration of the exchange power of Yen. Its major causes were undoubtedly the prolonged depression in America and the appearance of artificial silk. As a whole, however, the effect of the recovery of foreign exchange on the export price level was not so great as had been feared of in 1933.

Digitized by Google

Moreover, the recovery of the cross rate somewhat kept the Sterling exchange in Japan dragging behind it for the year at a point 2.5% below the average in the previous year. This is to say that Japan gained so much in the trade conducted by means of Sterling bills, which amounts to about 60% of her total foreign trade.

Capital Flight Prevention Law

The outflow of capital from the country that started at the time when the money market remained extremely easy after the return to the gold standard in January, 1930 began to assume heavy proportions from July, 1931, according as speculation in exchange and investment in securities in foreign currencies, both made in anticipation of the depreciation of the yen, became more active. In particular, side by side with the general advocacy of the re-imposition of the gold embargo that had prevailed in the country since Great Britain went off the gold standard in September, 1931, purchases of foreign currencies went on, resulting in considerable shipments of gold abroad. Facing this aggravation of the situation, the Government was obliged to impose again an embargo on the export of gold in December, 1931. The re-imposition of the gold embargo thus effected caused the external value of the yen to deviate, as a natural result, from gold value and to depreciate sharply. With the commencement of 1932, however, the downward movement of the yen exchange somewhat slowed down, and speculation in exchange declined to a remarkable extent. But a sharp decline in the prices of Japanese bonds in foreign markets resulting from loss of confidence led to active investments in profitable securities in foreign currencies, thus causing the outflow of capital to be much heavier. In view of these developments, the Government, in order to control the movements of capital in and out of the country and to maintain the external value of the yen, submitted to the Diet in the 62nd session a bill for the prevention of the flight of capital. The Capital Flight Prevention Law that had thus passed the Diet and the Ordinances of the Department of Finance issued in accordance with the Law were put into operation as from July 1, 1932, and have been effective until the Foreign Exchange Control Law came into operation in May, 1933. This Law, the principal object of which was to prevent the flight of capital, was analogous to foreign exchange control laws now in force in other countries, but was entirely different in its object and the extent of control. It vested the Government with authority to prohibit or restrict transactions or acts likely to create the flight of capital. The scope of transactions or acts coming under this Law and the manner of control were, however, provided for in detail in the Ordinances of the Department of Finance issued in accordance with the Law. The contents of the Ordinances may be summarized as follows :

1. Scope of transactions or acts.

Unless permission of the Minister of Finance has been obtained, the following transactions or acts are not permitted :

(a) Remittances to foreign countries or the purchase of foreign currencies or foreign exchange to be made with the object of transferring capital to foreign countries, with the exception of remittances to Kwantung Province or to the South Manchuria Railway's leased districts to be made for investment in these territories.

(b) The purchase of foreign currency securities (public bonds, company debentures and shares, expressed in foreign currencies), with the exception of the purchase of foreign currency securities which were in existence on July 1, 1932 (the date of the coming into operation of the Capital Flight Prevention Law) and of foreign currency securities imported after such date under licence from the Minister of Finance and

Digitized by Google

the purchase by foreigners of foreign currency securities with the funds which they hold abroad.

(c) The import of foreign currency securities, with the exception of the import, for the purpose of obtaining payment, of securities of which the place of payment is in Japan, within three months prior to the date of maturity or after such date.

(d) Conclusion, for whose account soever, of a contract of deposits or loans expressed in foreign currencies.

(e) The issue of company debentures expressed in foreign currencies.

2. Report and examination of transactions or acts.

Persons engaged in foreign exchange business, dealers in securities, and other persons are under obligation to present the following reports to the Government in respect of matters relating to transactions or acts prescribed by the Ordinances. The Government may, in case of necessity, make examinations of their books and other documents.

(a) Persons engaged in foreign exchange business are required to present, within the following month, a detailed statement of sales and purchases of foreign exchange, forward exchange contracts, remittances to foreign countries, collections of money from abroad, and letters of credit issued.

(b) Dealers in securities are required to present, within the following month, a detailed statement for each month of sales and purchases of foreign currency securities or of their brokerage business.

(c) Persons holding on July 1, 1932 foreign currencies, foreign exchange, deposits or loans expressed in foreign currencies, or foreign currency securities and those holding company debentures and deposits and loans from others, expressed in foreign currencies, are required to report, not later than July 31, 1932, the amount of their holdings and other details.

(d) Persons who acquire or liquidate, on and after July 1, 1932, claims expressed in foreign currencies as mentioned in (c) above or those who incur or are freed of obligations expressed in foreign currencies are required to report the amounts thereof and other details within the following month.

3. Order respecting the compulsory disposal of assets expressed in foreign currencies.

The Government is authorized to require persons in possession of foreign currencies, foreign exchange, or securities or other claims expressed in foreign currencies to sell them to the Bank of Japan or to others to be designated by the Government.

4. Penal provisions.

As in the case of legislation in different countries of the world, the principle of severe punishment has been adopted in applying penal provisions to acts of violation specified in the Ordinances. Thus, persons contravening the prohibitions or restrictions of transactions or acts as prescribed in the Ordinances are liable to punishment by penal servitude or imprisonment for a term not exceeding 3 years or to a fine not exceeding 10 thousand yen (or not exceeding three times the value involved in the transaction in question in case three times the value of said transactions exceeds 10 thousand yen), and persons not presenting reports or refusing the examination of books and other documents are liable to imprisonment for not more than 6 months or a fine of not more than 5 thousand yen.

5. Impress of stamp on foreign currency securities.

Foreign currency securities which were in existence in this country on

Digitized by Google

July 1, 1932 and which have been reported within a period as specified by the Ordinances and those imported subsequently under licence from the Minister of Finance may be presented by the owner or other party at interest to the Bank of Japan, and impressed with stamp. This system has been created for the purpose of certifying that such securities as referred to above would, after being impressed with stamp, be the objects of sale and purchase in the country.

CHAPTER X

HOME TRADE AND COMMERCE

Development of Business Houses

Origin of Tokyo Chamber of Commerce The Yedo (Tokyo) City Assembly was the predecessor of the present Tokyo Chamber of Commerce and Industry, and dates back 133 years. It was Lord Etchu-no-Kami Matsudaira, the then Vice-Premier (Roju) of the Shogunate Government, who advanced a plan to organize a public business body to accommodate merchants with funds and to carry out relief enterprises is now known as the Tokyo Chamber of Commerce and Industry. The late Viscount Eiichi Shibusawa was the first President of the Chamber and served in that capacity for 30 years, until his resignation in 1902.

International Chamber of Commerce Japan first attended the plenary conference of the International Chamber in 1923 in London, when Mr. Raita Fujiyama, then president of the Tokyo Chamber and All-Japan Chamber was the representative. The present chairman of the Japanese Committee of the International Chamber of Commerce is Mr. Manzo Kushida, chairman of the board of directors of the Mitsubishi Bank, and Baron Seinosuké Goh holds the dual position of president of the Tokyo Chamber of Commerce and Industry, and of the Japan Economic Federation.

Business Companies The Mitsui-Gumi, Ono-Gumi, Shimada-Gumi and several other business concerns were founded early in the Meiji Era, but the system and management of these concerns were primitive and the companies were quite different from business companies in the modern sense of the term. The Meiji Government encouraged the development of the country's foreign trade and this resulted in an accumulation of capital and growth of modern businesses in large cities and ports. So-called trading companies and exchange companies were established under Government encouragement and financial help in such cities and towns as Tokyo, Saikyo (Kyoto), Osaka, Yokohama, Kobé, Niigata, Tsuruga and Otsu. These institutions were the precursors of the joint-stock companies of later years though for a time, with the abolition of the Trade and Commerce Commissioner in July, 1871, they ceased to exist. During the period of their non-existence the Government tried to disseminate a knowledge of commerce and industry by distributing books written by the late Mr. Genichiro Fukuchi and the late Viscount Shibusawa. As a result of the establishment of national banks following the revision of the National Bank Act in 1876 and also stimulated by the situation following the Satsuma Rebellion of 1877, joint-stock companies of various natures were established. The Tokyo Marine Insurance Company, Tokyo Horse Tramcar Company, Japan Railway Company, Osaka Spinning Company, Yokohama Specie Bank and other concerns were created one after the other. At the end of 1882 the number of trading concerns in the country was 968, but at the end of 1886 it had decreased to 315, due to a business depression. After the establishment of the convertible note sys-

Digitized by Google

tem in 1896 business concerns began to increase once more and a great many concerns such as shipbuilding, machine manufacturing, weaving, mining, electricity, gas, paper milling, oil refining etc., were founded. With the promulgation of the Commercial Code in 1889 business concerns acquired a legal standing and in 1892 a revision was made in the laws concerning companies, bills and bankruptcy. A thoroughgoing revision was introduced into the Code in 1899. Regulations concerning debenture flotations were issued at the same time.

Business was greatly stimulated by the Sino-Japanese War, Russo-Japanese War and the World War, and wide expansions took place at these times. Before the World War, the fostering of new business was a feature of this country but business expansion and enlargement by merger characterized the situation during the World War. Large concerns absorbed small concerns until joint-stock companies with capitalization of ¥5,000,000 each accounted for 65 per cent of the total number of these companies after the War. The increase in size and concentration of capital gave rise to the monopolistic tendency of a limited number of large business concerns wielding great power. For example, in electric power circles the so-called "Big Five" electric power concerns, namely, the Tokyo Electric Light Company, Toho Electric Power Company, Daido Electric Power Company, Nippon Electric Power Company, and Ujigawa Electric Company absorbed many small companies and now control 66 per cent. of Japan's total power of 2,240,000 kilowatts generated by 62 concerns. In the spinning business, the two largest companies, that is, the Kanegafuchi Spinning Company and Toyo Spinning Company control 14 and 13 affiliated concerns respectively. This monopolistic trend has become more pronounced since the 1927 panic in banking circles. The Big Five ordinary banks, namely, the Dai-Ichi, Mitsui, Mitsubishi, Sumitomo and Yasuda Banks handle nearly 40 per cent. of the total deposits. In life insurance circles also, the five largest concerns, namely, the Nippon Life, Chiyoda Life, Meiji Life, First Mutual Life and Teikoku life have more than 45 per cent. of the total life insurance contracts in Japan. This tendency has naturally solidified the foundations of big business houses such as the Mitsui, Mitsubishi, Sumitomo and Yasuda. For instance, the Mitsui interests now control 120 subsidiary and affiliated concerns, with a total capitalization of about ¥1,600,000,000, or 15 per cent. of all capital invested in business.

Formation of Cartels The formation of cartels by various kinds of industries is a feature of recent years. Free competition in business usually contributes to industrial development, but, in case supply is excessive, sundry troubles appear, and in order to counteract such troubles, cartels have been organized in various industries. The first curtailment of production in Japanese industry was carried out for eight days and nights per month for three months, commencing June 15, 1890, by the Japan Spinners' Association (founded in 1882). Such a practice was observed by many other industries after the Russo-Japanese War and the World War. Leading cartels in Japan are, the Coal Mining Association, Electro-Copper Joint Sales Office, Steel Manufacturers' Society, Pig Iron Joint Association, Steel Traders' Association, Super-Phosphatic Fertilizer Traders' Association, Japan Paper Mill Association, Joint Foreign-Style Paper

Digitized by Google

Sales Guild, Joint Pulp Sales Company, Japan Portland Cement Association, Japan Spinners' Association, Spun Silk Association, Rayon Sales Association, Woollen Industry Society, Central Silk Association, Sugar Producers' Association, Japan Flour Association, Beer Sales Agreement, Joint Ice Sales Guild, Canned Crab Marine Product Association and many others.

Economic Conditions in 1934

The General Situation The year 1934 was marked by the reappearance of the inflation boom stimulated by the gold dollar devaluation policy adopted in the United States. It greatly affected the prices of commodities and stocks throughout the world. Its effect was also felt in Japan. Another factor that worked as stimulant on the economic and commercial circles was the rapid recovery in the price of rice due to the promulgation of the Rice Control Law. Though at first much doubt was entertained as to the effect of the Law in view of the huge rice stock brought over from the preceding year, the Government's purchases which amounted to 7,000,000 koku up to the end of January, gave a salutary effect on the rice market. Moreover, arms industries were prosperous; money rates were easier; and overseas trade was rapidly growing. The favourable reports of the business condition of the latter half of 1933 of most of the big corporations caused the Stock market to maintain a firm tone from the beginning of 1934 and purchases of miscellaneous shares went up to a record figure during February and March. According to the Tokyo Stock Exchange, the index number of the average price of shares rose from 117 of December, 1933, to 135 in March, 1934, the rise being 15%. The market value of all stocks in the country rose from ¥16,000,000,000 to ¥19,000,000,000. A setback, however, took place as from April. One of the causes of this change was the altered economic condition of the world. Shares and commodities which had been moving upwards in Europe as well as in the United States suddenly took a reverse turn, the United States taking the lead in the downward movement. Steel which was firm at $59 in February fell to $33 in July, and the average price of 30 industrial shares fell from $111 in February to $34 in July. At the same time commodities fell from 106.4 in February to 105 in May, according to the American price index number. This naturally affected this country.

The second cause was the record fall of silk. In December, 1933, it was barely able to maintain the ¥660 basis at the highest, which, however, rose to ¥674 in February due to stimulation from the United States. But in March, it paled off to ¥606 and in June further down to ¥500. Naturally the cocoons dropped to ¥1.50, a 50% fall as compared with 1933, which proved a serious blow to the economic life of the agricultural communities.

The third cause was the uneasiness in regard to the political situation. This was caused by the uncertainty whether or not the Saito Cabinet would resign. All these causes combined could not help affecting the stock market, causing a fall in the index number from 135 in March to 129 in April. In May there was a little revival but the general weak tone remained unchanged. Meanwhile, the price level of commodities maintained an upward tendency until May, due to artificial measures taken by the Government keeping up the prices of the daily necessaries. But

Digitized by Google

other commodities continued to go downward after April. This condition was well reflected by the decrease in the volume of railway traffic and an increase of goods stocked in warehouses. The effect was also visible in the diminished amount of bills cleared and in the slow pace of all domestic business transactions. The overseas trade, however, continued prosperous. The money market remained as a whole as dull as ever, and so the last half of 1934 proved to be as sluggish as the second quarter of the year.

Slow to Recover The situation was not much improved by the advent of the Okada Cabinet. The new Cabinet was a de facto continuation of the Saito Cabinet and it was thought that nothing new could be expected of it. Moreover the finance policy of Mr. Fujii, new Finance Minister was such that caused apprehension in financial circles for the possible increase in taxation. A third cause that rendered the revival difficult was the restrained tone of the money market, especially of the short call, which was 2 or 3 rin above the level in the first half of the year. A fourth cause was the increasingly distressed condition of the agrarian economies. Following the slump of the cocoon industry due to the collapse in the price of cocoons in the course of spring to autumn, the damages wrought by typhoon and flood in September on crops brought about a big loss in the harvest. A fifth cause was the condition in foreign markets which worsened, especially that of the United States. The United States was still in the throes of depression. Steel dropped to a level below $30, a record since the gold re-embargo. Crops were much worse than what had been forecast. The price situation alone was rather firm on account of the rise in the prices of agricultural products. This, however, was of short duration, for September saw the reappearance of the price level of earlier days of 1934, thus dispersing the much expected devaluation boom. In Europe uneasiness in the international political situation was working to arouse public apprehension of the approaching collapse of the gold bloc. All these contributed to the difficulty of the economic revival of the country. In the meantime the expectation of the outcome of the Anglo-Japanese trade parley and, later, of that between delegates of Japan and the Netherlands proved unreal. The typhoon and flood disasters in the manufacturing centres of the Kansai districts came on its wake. Then as if to aggravate the situation, the tax-increase programme of the Finance Minister Fujii leaked out, which caused a sharp fall in the stock market. In December, however, Mr. Fujii resigned on account of illness and Mr. Takahashi was reappointed Finance Minister, which gave a soothing effect on the stock market.

Prices of commodities were taking a uniform onward movement throughout the latter half of 1934. Principal factors in this were the rise of the price of rice due to artificial Governmental policy and the advanced price of building materials due to the typhoon and flood disasters. Other commodities simply followed the lead by the aforesaid groups of commodities. Overseas trade as a whole continued to be as prosperous as in the preceding half year, and so was the general situation in all the productive industries.

November	108	97	116	100	—	102
December	108	102	108	100	100	105

December 1933=100

Inflation A marked feature in the financial and economic world of the country throughout the year was the continued expansion of the Government's budget. Though the amount that was to be met by the issuance of bonds showed a slight decrease as compared with the previous year, the amount of bonds actually issued was greater than in the previous year. To make the issuance of the large amount of bonds easier and economical to the Treasury, the Government policy tended towards keeping the market rate of money as cheap as possible. This caused an abundant utilization of funds and made possible the promotion and extension of various industries, which, assisted by the activities of heavy industries, made industrial conditions, in general, fairly prosperous. Another factor that should be noted was the exchange situation. The sterling exchange was homologous as ever before. The dollar exchange recorded a recovery of 50% on account of the devaluation of gold dollars, but its beneficial effect on Japan's trade with the United States was greatly diminished by the subsequent advancement in the commodity price range in that country. However, its stabilizing effect on the exchange markets throughout the world was a stimulant to the general overseas trade activities of Japan which showed an increase of 10% in exports and 19% in imports. The increased export business went on alongside with the lively activities of various export manufacturing industries. This, together with the brisk condition of the heavy industries, has made the whole financial aspect brighter.

Various financial indicators are fairly conclusive on this point. As compared with 1933 there was an increase of 16% in the capital investment, of 8% in the manufacturing production and of 18% in the aggregate net profit of business corporations. This gainful condition of industrial circles is well reflected in the workingmen's employment statistics of the Bank of Japan, which indicate an increase of 10%. No gains in wages were reported, but the increase in the number of the employed was itself a good thing, as it meant a corresponding increase in the aggregate of wage-earners' in-

comes.

Agrarian Villages In sharp contrast to this prosperous condition of the urban communities the agrarian villages continued to be hard-hit throughout the year. Rice, cocoon and barley are the three most important agricultural products. Only in the barley harvest there was seen an increase. Rice dropped by 30% on account of the various disasters caused by nature. Though the revival in the price of rice by the control of the Government did much in relieving the hardships of rice producers yet the decrease was estimated at 10%. The worst condition was witnessed in the case of cocoon raisers. Affected by the tremendous fall in the price of silk yarns, cocoon production was 60% less than in the previous year. The painful condition in the agrarian communities owing to the unsatisfactory state in the two staples hampered much the natural course of inflation.

INDEX NUMBERS OF BASIC PROSPERITY INDICATORS

(Compiled by the Asahi)

	1931	1932	1933	1934
Prices of commodities	100	120	137	142
Prices of shares	100	126	182	220
Railway traffic	100	101	114	127
Bills cleared	100	111	140	135
Overseas trade	100	119	158	187
Capital for business promotion	100	79	204	237
Men and women in employment	100	107	136	160
Engineering production	100	100	111	122
Agricultural production	100	105	121	131
Profits of corporations	100	126	159	138

A Setback Though the economic condition in 1934 was as a whole better than that in the preceding year, the rising percentage of all index numbers in 1934 was lower than in 1933 and in the amount of bills cleared as well as in the agricultural production there occurred a material decline. As to agricultural products, the decrease was largely caused by natural disasters. The decrease in the former, however, reflects a decrease of commercial transactions, a setback in the economic activities in general.

COMPARISON OF RISING RATE OF INDEX NUMBERS IN 1933 & 1934

(Compiled by the Asahi)

	1933	1934
	%	%
Prices of commodities	14	3
Prices of shares	44	21
Railway traffic	13	10
Bills cleared	26	4 lower
Overseas trade	33	18
Capital for business promotion	158	16
Profits of corporations	27	18
Men and women in employment	11	10
Manufacturing production	15	9
Agricultural production	26	13 lower

This hesitant tone in the onward march of recovery can be explained by the following:

1. Adoption in many countries of anti-Japanese measures.

2. Diffusion of cheap-rated money reaching a saturation point to almost all parties in need of it and the unification of monetary policies by the Bank of Japan.

3. Tendency to over-production on account of the extension of productive capacities.

4. Diminishing of purchasing power on account of the poverty stricken condition of the agrarian communities.

Business Transactions in 1934 In 1934, the aggregate quantity of railway traffics was 5,526,000 kilotons, an increase of 529,000 kilotons (11%) as compared with the previous year.

Digitized by Google

RAILWAY TRAFFIC MOVEMENT

(Report of the Ministry of Railways)

	Monthly Average (1,000 metric tons)	Index Number	Compared with the Previous Year %
1928	5,672	100	—
1929	5,633	99	(−) 1
1930	4,867	86	(−) 13
1931	4,369	77	(−) 11
1932	4,399	78	1
1933	4,997	88	14
1934	5,526	97	11

Chief railway traffics were steel and iron, mineral ores, coal, oil, copper, etc., most of which were for use in heavy industries. Next in importance were cotton yarns, lumber, etc. The increase in the cotton yarn is indicative of a corresponding increase in the overseas trade and the increase in the lumber traffic was the natural outcome of the typhoon and flood disasters that occurred in the latter half of 1934.

RAILWAY FREIGHT INCREASE

(Report of the Ministry of Railways)

	1934 (1,000 metric tons)	Comparison with 1933 %	Comparison with 1931 %
Rice	3,343	14	18
Lumber	6,904	17	44
Sand	2,961	7	17
Steel and iron	910	29	71
Cement	1,237	8	23
Coal	23,139	9	9
Manure	2,944	11	7
Cotton yarns and cotton fabrics	589	12	29

Of the 35 kinds of principal goods those which dropped as compared with the previous year were cattle, calves, pigs, beverages and stones and those which remained stationary were wheat flour, salt, dried fishes, artificial manure, sugar, saké, etc. It should be noted that most of these goods were for home consumption, some being agricultural products and other requisites for farmers. The non-increase in the traffic of home consumption goods is indicative of the fact that the post gold embargo inflation prosperity was a prosperity that had grown up independent of the purchasing power of the masses. The stationary condition of agricultural requisites is a reflection of the depressed condition of the farm communities.

The railway traffic condition is also reflected in the movement of goods in warehouses. The total amount of goods brought to or away from principal warehouses in 6 big cities of the country was 128,000,000 packages in 1934, an increase of 15% as compared with the previous year and 43% as compared with 1931, the lowest post world-war record. As regards the total amount of goods brought in, the increase compared with 1933 was 14% and, as regards the total taken away, the increase was 17%. The increase rate of the total stocks at the end of 1933 in comparison with the previous year was 26% which at the end of 1934 decreased to 10%, indicating a turn for the better so far as the movements of goods are concerned.

Expansion of Enterprises An important fact that characterized the business world in 1934 was the great increase in the amount of capital and number of new industrial establishments stimulated, of course, by the favourable exchange rate of the yen and the boom of heavy industries, new schemes aggregating ¥1,334,000,000, an increase of ¥199,000,000 (17%) as compared with 1933 and of 204% as compared with 1932. Metallic and manufacturing industries took about 60% of this huge total amount and of the manufacturing industries about one half was for chemical and mechanical undertakings. In banking, insurance, warehouse, aquatic production, agriculture, forestry and gas and yarn

Digitized by Google

manufacturing it was the reverse that took place, indicating a great change in the industrial life of Japan. Silk and cotton were two pillar industries of Japan, but they are no longer so today. Silk is rapidly being displaced by artificial silk, and cotton yarns and fabrics seem to have reached their saturating point, and in place of them new ones represented by mechanical, precision mechanical, and chemical industries has made a marked headway. From light industries to the heavy industries and from coarse mechanical industries to the precision mechanical industries, this was the trend that could well be discerned in Japan's industrial history of 1934.

INVESTMENT OF BANKS AND CORPORATIONS IN 1934

(Compiled by the Bank of Japan)

(In ¥1,000)

	1934	1933	1932
Banking	1,000	4,625	35,400

Productive Activities The increased new capital and extended employment of the hitherto unused capital gave the mining and manufacturing industries a further stimulus and made them possible to realize activities of 131% as against 121% in 1933 and 100% in 1931, the percentage of increase in 1933 being 15% as compared with 1932 and that in 1934 8% as compared with 1933.

Artificial silk made the most notable stride of all manufacturing industries in the past three years, the annual percentage of increase in comparison with the previous year having been 37% in 1932, 35% in 1933, and 50% in 1934. The progress in 1934 is specially notable because all other industries suffered a relative decrease in that year. While the average monthly production was 39,000 casks in 1931, it jumped to 120,000 casks in the last month of 1934. This is of course due to the almost perfect equipment, the much lower rate of the labour cost and the favourable exchange rate which had made possible the marked expansion in its overseas trade.

The bulk of cotton goods is for exporting abroad, 70% being manufactured for that purpose. Despite various measures taken in foreign countries to check its influx the overseas trade of cotton goods is still on the increase, the 1934 returns disclosing its gain over the British output. Thus, the production of cotton yarns leaped from the monthly average of 210,000 bales in 1931 to 300,000 bales in the closing month of 1934, the percentage of increase in the 3 years being 50%.

The expansion of artificial silk necessarily followed the great stride of artificial silk fabrics, the expansion percentage in the 3 years ending 1934 being over 100. Steel materials, pig iron, bleaching-powder,

Digitized by Google

caustic soda and soda ash all made an expansion of 50-100% in the same period of years. Principal mining and manufacturing industries as represented by the index number to show their expansive business records follow:

INDEX NUMBER OF MINING AND MANUFACTURING INDUSTRIES

(Compiled by the Mitsubishi Keizai Kenkyusho)

	1931	1932	1933	1934
Export Manufacturing				
Silk yarn	100	88	88	97

Beer	100	100	131	131
Sugar	100	82	97	98
Wheat flour	100	101	117	120

Business Results of Corporations The business results of all industrial corporations showed a decided increase in the year under review. 89 normally operated business corporations 16.6% profit for the last half of 1933, 18% for the first half of 1934 and 18.1% for the second half of the same year. Compared this with the second half of 1931, the last half year before the gold embargo was instituted, the increase rate was 68%.

BUSINESS OPERATIONS OF REPRESENTATIVE INDUSTRIAL CORPORATIONS

(Compiled by the Asahi)

	Net Profit Percentage	Index Number	Dividend Percentage	Reserved Dividend Percentage
1931 Second half	10.8	100	6.8	33.8
1932 Second half	12.3	113	6.5	44.5
1933 First half	15.2	141	7.5	54.5
Second half	16.6	153	7.1	55.4
1934 First half	18.0	168	7.8	54.4
Second half	18.1	168	8.0	53.4

The causes of these encouraging results of industrial corporations were, beside the general favourable conditions on account of the brisk export trade and the expansion of industries manufacturing military supplies, (1) the conversion of high rated working capital to the lower rated one, the process of which had penetrated into almost all industries, (2) the increase in the efficiency percentage of the working capital to the maximum extent because of the reimbursements of debentures and the writing-off of bad assets made out of the reserved profits which had been accumulated during the past several business terms, (3) the increase of production owing to the extension of productive and business scales, (4) the mobilization in the case of certain industries of the hitherto unused working capital by the lifting up of artificial bans long in operation for the restriction of production, and (5) the rise in the per unit price of products. But the fact that, while the business results in 1934 were continuously on the increase as a whole, the expansive power of the profit percentage came to a standstill in the second half of the same

Digitized by Google

year and that the profit reserving percentage decreased in the two continuous half yearly business terms can be taken as an indication of the inflation boom facing its end temporarily as it might be, if not as a final event.

If the business results are studied dividing industries as between manufacturing and auxiliary, there is shown a big difference. While auxiliary industries were able to obtain satisfactory results in the second half of 1934 continuously from the previous business terms with their profit percentage tending further upward, manufacturing industries were forced to be satisfied with a lowered rate.

PROFIT PERCENTAGE ACCORDING INDUSTRIES

(Compiled by the Asahi)

Manufacturing Industries	1933 Second Half	1934 First Half	1934 Second Half
Food stuffs	22.9	25.7	25.9
Cotton yarn spinning	26.8	31.1	32.1
Other fiber spinning	44.8	39.5	37.2
Mineral refining	19.5	23.6	23.6
Machines and machinery manufacturing and shipbuilding	6.1	7.8	9.9
Chemical goods	15.7	15.5	16.3
Ceramics	33.6	32.0	22.0
Oil	11.6	7.4	7.4
Collective	22.1	23.7	23.6
Auxiliary Industries			
Electricity and Gas	10.9	12.0	11.9
Land transportation	12.6	12.5	12.9
Sea transportation	21.6	19.9	25.4
Trading and others	11.6	13.8	14.2
Trust business	23.2	24.3	20.6
Land and buildings	7.6	7.4	7.4
Bourses	12.2	10.2	9 1
Collective	12.3	12.7	12 9

In the manufacturing industries ceramics on account of overproduction, oil on account of reckless competition, and miscellaneous fibre industries on account of the depression of the wool market recorded declines in business ; but refining of minerals, and machinery, shipbuilding and chemical industries are all making substantial profits. In the auxiliary industries excepting the sea transportation industry none had made a good record. Exchanges were worsened on account of the decrease in the amount of transactions made. As for the real estate business, it showed no difference with the conditions prior to 1932. (As to foreign trade and money market see the chapters concerned.)

Stock and Produce Exchanges

Tokyo Stock Exchange The exchange system in Japan dates back to an early period of the Tokugawa era, but it was then confined mostly to deals in rice. Exchange houses in this country are of three kinds, namely, stocks, rice and other commodities. There are 29 exchange houses devoted to dealings in securities, either exclusively or in combination with other commodities. The exchanges here are more on the European continental plan than those of either England or America, and are subject to strict control by the Ministry of Commerce and Industry or other supervising authorities of the Government. Such controlling authority is empowered to interfere in the business of an exchange when it is considered that the exchange is abusing its privileges or acting in an irregular way.

The Tokyo Stock Exchange was established in 1878 after the Satsuma Rebellion, when the issue of public bonds was rapidly increasing and the country's business was beginning to get active because of the successive establishment of national banks and concerns conducting business analogous to the banking business. Under the auspices of Viscount Eiichi Shibusawa and other influential business men of the day the Tokyo Stock Exchange was established at Kabuto-cho, Nihombashi-ku. Kabuto-cho has become a synonymous term for the exchange, as Wall Street is to the New York Stock Exchange. The initial capital was ¥200,000. When the exchange was established the scope of business was limited mostly to new and old pension bonds, Tokyo Stock Exchange shares, First National Bank shares and Tokyo Rice and Produce Exchange shares. The goodwill claimed by a licensed broker attached to the Exchange was very small, a striking contrast with the ¥200,000 to ¥500,000 demanded in recent years for a seat. As security for good faith a licensed broker was required to deposit ¥100 with the Exchange, to-day the broker has to deposit ¥150,000, and this not with the Exchange but with the Ministry of Commerce and Industry. The number of futures dealt in, as registered on the exchange, was in 1882, 3,601 shares, which number had increased to 3,572,110 shares for 57 different securities by 1897, after the Sino-Japanese War; to 12,013,120 shares for 106 varieties by 1907, after the Russo-Japanese War; and to 37,274,040 shares for 300 listed securities by 1920, after the World War. The Osaka Stock Exchange was founded in July in 1878, two months later than the Tokyo Stock Exchange. After 1882 the Government adopted a policy of restricting speculative transactions and the stock exchange business was hard hit, but in later years a more generous policy regarding the establishment of bourses was adopted and, consequently, the number of rice and produce exchanges, which was only 13 at the end of 1892, had increased to 83 by the end of 1894. There were three stock exchanges only at the end of 1892, but 37 at the end of 1896. With a rapid increase in business prosperity after the Sino-Japanese War enthusiasm for speculation increased and many exchanges with a small capitalization cropped up. The same was observed after the Russo-Japanese War and during the World War boom. The great World War stock boom lasted till about the middle of March, 1920, when a financial reaction took place in Japan. Before the World War, 12,588,000 shares valued at ¥1,340,000,000, in 1907 was the largest number dealt in, but in 1915 the deals

Digitized by Google

amounted to 19,560,000 shares with an aggregate of ¥1,670,000,000, and a further gain to 40,870,000 shares totalling ¥6,185,000,000 was made in 1919. The March deals in 1920 amounted to 6,570,000 shares with an aggregate of ¥1,150,000,000. In line with activity in securities there was heavy dealing in commodities, and a sharp increase in the price of rice following speculative dealings caused a serious social situation. The spot rice price of ¥10 per koku in the autumn of 1914 had gone up to ¥20 in 1917, and in September of that year the Government issued an anti-profiteering act for the prevention of high prices in rice and other staple commodities, but the rapidly rising prices could not be checked. In August of 1917 the rice price went up to as high as ¥40 per koku. This finally resulted in the outbreak of a big rice riot throughout Japan, following which a heavy reaction took place in stock and commodities prices. The price of the Tokyo Stock Exchange Company's shares, the leading issue of all, attained the height of ¥549.90 in March, 1920, but fell to as low as ¥274 on April 14. This heralded a panicky decline of prices and, consequently, the Tokyo Stock Exchange had to partially suspend business from April 14 to May 10. The exchange borrowed ¥40,000,000 from the Bank of Japan through 16 banks and advanced money to brokers to allow them to effect out-of-the-market compromises.

Prices of Shares in 1934 The economic aspect in 1934 was best reflected in the price of commodities and shares. While shares were boomish with the index number of 220 as against 182 in 1933, the price level of commodities showed an improvement of only 3% at 142 against 137 in 1933. But the official monthly report shows that the general trend of shares resulted in the 2% decline by the end of 1934 in comparison with the earlier days of the year, while during the same period prices of commodities made an advance of 3%. All this was partly due to the abundant antecedency character of shares with reference to the economic prospect but was greatly due to the Government's artificial operations to lift up the price of rice and the enhanced price range of building materials. It would not be mistaken to conclude that though the price level went upward as de facto conditions, as a matter of forecast it was draggish and on the decline.

INDEX NUMBERS OF SHARES

(Prices in 1921 taken as 100)

(Compiled by the Tokyo Stock Exchange)

	Shares in General	Quantity	Principal Shares	Amount of Shares (in ¥1,000,000)
Average of 1933	98	117	148	—
1934 Jan.	121	89	143	17,268
March	135	112	148	19,154
May	132	95	141	19,103
July	131	81	126	19,894
Sept	124	78	121	19,791
Nov.	114	92	113	18,244
Average of 1934	126	84	132	—

Another feature which characterized the 1934 stock market was the equalization of the prices and yields of shares. All first rated shares of mining, fibre spinning, manufacturing industries and of the Stock Exchanges had dropped sharply or at least remained stationary, and, on the contrary, public utilities, shippings, miscellaneous transportations, fisheries, etc. made sharp boundings.

After all, the continued attempts in foreign countries to curb the influx of Japanese goods and the seemingly increasing overproduction induced enough warnings to the stock market, and these conditions coupled with the increased holding off of speculative stocks due to the prospective spreading of the economic uni-

Digitized by Google

fication programme were the causes of the aforesaid reversed tendency. It was, in fact, the real investment market as against the speculation market that won out during 1934.

INDEX NUMBERS OF SHARES

Production of Minor Factories There are many industries in Japan which are engaged in by innumerable minor factories where less than 5 persons

Digitized by Google

are employed and which do not come under the control of the Factory Law. Accordingly, most of the industrial statistics given in the following chapters are of factories where more than 5 persons are employed. The Ministry of Commerce and Industry gives statistics on more than 20 kinds of industry in which the largest numbers of such minor factories are engaged. The following table includes most of them, the production of which alone reaches almost one-tenth of the total production given above.

Prices

Prices in 1934 The price level which touched its ceiling in the earlier days of 1933 remained stationary for the full following two years. It is true that the wholesale price index numbers passed through some up and down changes in the course of 1933, nothing worth mentioning occurred in 1934 despite that in the last quarter of that year a slight increase of about 8% took place, as compared with the corresponding period of 1933 principally on account of relief measures carried out by the Government, but, as the year drew by, this 8% divergence diminished to 2%, and in the average wholesale price levels of the two years the difference counted only 4%. This difference can be counted as nothing if the price increases in rice and building materials which were not natural are excluded in the calculation

PRICE INDEX NUMBERS BY CATEGORY

(Compiled by the Asahi)

	Nov. 1931	1932 in average	1933 in average	1934 in average	Comparison with the previous year %
Grain	100	122	135	152	13
Other foodstuffs	146	161	178	177	(—) 1
Fabrics	86	111	133	131	(—) 2
Metal manufactures	74	102	111	131	18
Fuel	137	137	147	156	6
Manures	57	73	81	80	(—) 1
Building materials	142	154	171	192	12
Miscellaneous articles	96	115	136	128	(—) 6

In the above figures two factors stand out conspicuously. The one is the intensified disharmony in the price movements of various articles. Though in the two years under review all made upward bounds, in the course of 1934 only 4 out of the 8 categories had advanced continuously, the rest being on the decline. Of these four that had recorded a continuous rise metal articles and fuel reflect the brisk condition of the industries for military supplies. In building materials is echoed the shortness in their supplies due to the typhoon and flood disasters in the Kwansai districts, and rice is indicative of the Government policy mentioned elsewhere. Of the four that presented the falling tendency foodstuffs and miscellaneous commodities manifest a decline in the general purchasing power, manures depression of the agrarian communities, and fabrics anti-Japanese goods measures adopted by foreign governments and the trend of overproduction at home. The other specific point worth noticing is the reversion that took place among consumption and production commodities in their respective movements. In the years prior to 1933 the rise in the average price movement was due to the rise of prices of production commodities. In 1934, however, it was due to the upward trend in the price ranges of rice and other consumption goods.

Wholesale Price The post war general trend of prices of commodities in Japan was by no means an exception from the world wide collapsing of commodity prices which, however, had been checked first in December, 1931, by the prohibition of the free export of gold and secondly by the passage of emergency expenditure budgets for the Manchurian incident and relief measures at the two different extraordinary sessions of the Diet both held in 1932. The reactionary rise of prices attained its climax in January, 1933, and the price movement in 1933 and 1934 passed without much fluctuation. In January, 1934, the index number (December, 1929 taken as 100) of the wholesale price was 95 which moved up slightly to 96 in February owing to the enhancement in the price of fibre stuffs. In March a slight setback was seen and until June 95 was the ruling price range. In August prospective bad crops and the increased activity in the munition industries restored the index to 96 which was further pushed upward to 98 in the latter part of September in consequence of the typhoon and flood disasters. In October it went further up to 99. In November a slight setback occurred with the index number of 98, Decem-

Digitized by Google

ber passed without change, a gain of 3.2% as compared with January.

Comparison with Retail Prices From January to February the wholesale index was 95-96, but during the same period retail prices were indexed at 88. From March to July the wholesale price level was 1.1% lower than in February and yet solid at 95. In contrast to this wholesale price situation the retail price index was 89 in March a rise of 1.1% as compared with February and remained with the same index number till May, and in June it was lowered to 86, a decrease of 3.4 % compared with the previous month. This was due to the increased seasonal marketing of vegetables, abundant fishery harvests, etc. July saw a reactional advance to 87. In August the prospective bad crops were quickly reflected in the enhanced price range by 1.1% in the wholesale and 2.3% in the retail price. In September the wholesale range was 2.1% higher than in the previous month, but the retail price was slow at 89. A sharp rise, however, took place in October both in the wholesale and retail price ranges, marking a record in the price history of 1934, 99 being the index of wholesale and 91 that of retail prices. Compared to 95 and 88 in January the record index figures were an increase of 4.2% wholesale and of 3.4% for retail. December, however, saw a setback at 98 for wholesale and 89 for retail. As for the margin between the wholesale and retail prices during January it was maintained at 7 and in June it was widened to 9. In October it was diminished to 8 which was again widened to 9 in November and was so maintained to the end of the year.

Wholesale according to Kinds Looking at the price situation in 1934 through 8 major kinds of commodities, viz., food stuffs, fibre goods, metal articles, building materials, industrial chemicals, fertilizers, fuel and other miscellaneous goods, with the average price of December, 1929, taken as 100, metals experienced the greatest fluctuation, next come building materials, food stuffs and industrial chemicals, while goods which had fluctuated least were fuel, fertilizers, miscellaneous goods, and articles of fibre in order. Metal goods were quiet at 108 in January and February and, moving since then slowly upward to 112 of August and further to 122 of September and to 123 of October, but visited by a slight reaction in the following two months closing the year at 113. Building materials were low in January at 98, taking about the same trend with metal goods for the seven months following. In August a slight gain was recorded at 101 and in September a further addition was made at 106 which was maintained in October but a setback took place in the remaining two months at 105 and 104 respectively. The gains and losses in the building materials and metals since September were directly and largely traceable to the effects of the typhoon and flood disasters. Food stuffs were slack for the first several months of the year at 86, became somewhat firm in May at 88 but in June a slight reaction set in owing to the increased marketing of wheat and salt salmons, but for the last three months of the year the prices showed again an upward tendency and the index number was 88 in August, 90 in September and 93 in October which was maintained throughout the rest of the year. Industrial chemicals were sluggish at 101 in January but at 89 for months until October when boom took place in anilin oil and pushed up to 94 which, however, was again lowered to 89. Fibre stuffs, though slow at 91 in January, a slight gain was re-

Digitized by Google

corded in February reflecting the seasonal recovery of the silk market and the firm tone in the cotton producing centres but another ebbing occurred in March which lasted until May. In June, however, reaction again took place influenced by the revival of demands for cotton goods in foreign markets and the enhanced firm tone in the cotton producing centres, with a result that the index rose to 94, which, however, failed to remain firm and lowered to 91 in November and 92 in December. Fertilizers were weak at 88 in January, and small ups and downs were seen until June when, owing to the marketing of the new rape oil cakes and the seasonal stoppage in the demand for superphosphate of lime, it fell to 85 and further to 84 in July. In August, however, reaction occurred influenced by the news of the prospective bad corps of beans in North Manchuria and the index became firm at 87 which was further pushed upward to 88 and 89 in September and October on account of the increased demand in Germany for bean cakes. In November it was pushed backward to 88, but in December the former basis of 89 was regained. Miscellaneous articles were optimistic at 110-112 in January and February influenced by the change of the raw rubber market situation toward the gainful condition. A slight setback took place in June, but in July the loss was regained and a firm tone was maintained until October when it went to 114 which, however, again fell to 112 in November and further to 111 in December. Fuel was most slow in fluctuation at 93 in January, 92 in June but reactive at 93 in July owing to the successful conclusion of the gasolene price agreement among the six petroleum companies and the Matsukata-Soviet oil interests which was further enhanced to the 95 basis in October and so remained until the end of the year.

Important Imports & Exports As regards the trend of the wholesale index number of important export and import goods based upon the average prices of December, 1929, as 100, the index of imports was 106 in January, 1934, which gained one point in February and remained at 107 until May. In August, September and October it was enhanced to 108 and 110 but in the following month it paled off to 107. As for the exports, inasmuch as the bulk of the articles are fibre stuffs, the price level of these goods was, as a matter of natural consequence, intimately affected by the up and down prosperity movement of the spinning world. In January it was 91 and stationary for the two following months at 92. In April it went down to 91, but soon reaction took place and until June it was at 93. A shrinkage set in in July and was weak at 92 for two months. In September, however, an upward reaction took place and the new level was 95 at which the prices were maintained until the close of December.

Comparison with Leading Countries In turning to the wholesale index table (July, 1914, taken as 100) of Britain and the United States in comparison with Japan the effect of the devaluation of the dollar currency in the United States well reflected in the other two countries, but it soon ceased and the declining tendency with occasional slight recoveries was the ruling feature for the latter months of the first half of 1934. In the latter half of the year, however, the sudden acute rise in the agricultural staples in the United States followed the upward turn of the price level of other general commodities, and in August the index became firm at 109. Prices in Britain also followed the step of

Digitized by Google

American goods looking for a prosperous time at 101, the highest record in the year. Japan surpassed the two countries in the race of the price recovery and was not weak at 166 in October reflecting the bad crops and the typhoon and flood disasters. Reaction, however, set in in all the three countries. In Japan it was felt as early as in November, 163 being the index for December. In Britain 99 was the ruling December price level. In the United States the December figure was 109. After all, in comparing the January index figures of the three countries to those of December, 1934, it is shown that the United States had gained 5.3 per cent. and Japan 3.1 per cent. while Britain remained stationary. This, as compared with the pre-war level, was a gain of 63 per cent. in the case of Japan, of 9 per cent. in the case of the United States, but a fall of 1 per cent. in the case of Britain.

Taking the average wholesale price of December, 1929, as 100, the wholesale index numbers in Tokyo and other 13 leading cities of Japan in 1934 were characterized with slight waves for the first half of the year but with the new upward tide incoming in the month of August, recess taking place in November and December. In January Osaka and Fukuoka were the cities where the index at 96 was in the highest point in comparison with other cities. Tokyo and Hiroshima stood next at 95. Kyoto was the third at 94, Nagoya and Niigata the fourth at 93, Kanazawa the fifth at 92. Kobe, Yokohama and Kochi the sixth at 90 and Sendai and Otaru the seventh at 88. In December of the same year these index figures were changed to 100 for Osaka, 98 for Tokyo, 97 for Kyoto, 96 for Kobe, Nagoya, Hiroshima, Fukuoka and Niigata, 93 for Kanazawa, Otaru and Kochi, 93 for Yokohama and 90 for Sendai. The rising percentage was 8 per cent. for Otaru, 6.7 per cent. for Kobe, 5.6 per cent. for Kochi, 4.2 per cent. for Osaka, 3.8 per cent. for Yokohama and Kanazawa, 3.2 per cent. for Tokyo, Kyoto, Nagoya and Niigata, 2.3 per cent. for Sendai and 1.1 per cent. for Hiroshima.

Retail Price Keeping pace with the progress of the inflation business since December 1931, the month in which the gold embargo was instituted, the price movement in Japan was, as a whole, steadily and acutely upward, but a standstill set in in the early months of 1933, but it does not mean that the whole situation was reversed. The retail price index number in 1934 in comparison with the average retail price level of December, 1929, taken as 100, was about the same with that in the previous year, though slightly high. In going over month after month fluctuations it is revealed that during the first half of the year 1934 the upward movement was insignificant, the addition being only 0.4 per cent. In June owing to the seasonal big fall in the prices of foodstuffs the index number showed a decline of 2.8 per cent. compared with May. In July, however, as prices of most goods excepting fuel made an upward turn, the index was recovered to the 87.2 basis, a rise of 1.3 per cent. compared with the previous month. In August another addition was made to 88.7 which was 1.7 per cent. higher than in July. This rise was due to the prospective bad crops and the firm tone of building materials. September was in a state of recess. In October, however, the typhoon disasters in the Kwansai districts enhanced the price index to 90.9, a record in the current year. This price enhancement was, how-

Digitized by Google

ever, temporary in nature and in the following month with the needed recovery works accomplished a sharp drop took place and the index was forced down to 89.4 in November and to 89.3 in December.

Retail Price according to Kinds If goods are classified into food stuffs, clothes and accessories, fuel, building materials and miscellaneous goods, the range of fluctuation of price in 1934 was narrow, only October and November, in which the after-effect of the typhoon disasters was most strongly felt, being exceptional months. The index number of food stuffs was 87.7 in January but a little firmer during the following three months. In May it was 88.5 but in June it fell to 83.5, a drop of 5.6 per cent. compared with the previous month. In July, however, on account of the seasonal rise in the prices of rice, fishes, vegetables, etc., it went up to 85.1 and in August it further rose to 87.3, a rise of 2.6 per cent. September remained quiet and in October another bound of 1.6 per cent. was recorded which, however, fell away in November. In December it was quiet with a rise of 0.7 per cent. As regards clothes and accessories, no price fluctuation had practically occurred for the first five months in 1934. In June, however, a slight advance of 1.5 per cent. was made. Since then only 0.3 per cent. rise was shown until October. In November a drop of 0.7 per cent. occurred on account of reduced cost of raw materials.

Fuel was heavy until February on account of over-supplies, but in March as stocks became gradually scarce a slight reaction took place firm at 90.9 which was a rise of 0.7 per cent. compared with the previous month. But from April it moved downward until July. The downward movement, however, was checked in August, and in November the demand season caused the price to turn upward abruptly, the index of that month being 91.9 which was a rise of 2.8 per cent. compared with the July scale. In December on account of the abundant stocks the price index lost 0.3 per cent. Building materials occupy the highest position of the five kinds of goods the average index in the year being 105.1. In January it was 99.7 which, taking a straight course of advancement, rose in October to 117.0. This rise of 17.4 per cent. compared with January was apparently due to the typhoon disasters that occurred in the Western Japan. As, however, supplies came quickly to meet the demands it was pressed down to 110.0 in November and to 107.1 in December.

Miscellaneous articles are less lively in reflecting the ebb and flow of the general economic condition. So the index number of these stuffs was feebly stationary for the first four months of the year and in May on account of the cheapened prices of raw materials and the decreased sales of articles it dropped by 0.6 per cent. June marked the entrance into a brisk period rising in July by 0.7 per cent. and in October the index reached the 88.0 basis, an increase of 3.8 per cent. compared with the previous month. It proved, however, to be the top of the rising tide and in November it was on the ebb losing 1.7 per cent. in that month and 1.5 per cent. in December.

In 13 Cities The trend of the average price index numbers in 1934 with the average price in December, 1929, taken as 100, was, as a whole, changeless, only a 2 per cent. gain having been recorded. The figure was highest in October at 90.9, the gain being 5.6 per cent. compared with 86.1 in June, the lowest index in the year. As regards the price move-

Digitized by Google

ment in various cities, Niigata gained 3.3 per cent., Sendai 2.9 per cent., Otaru 2.6 per cent., Fukuoka 2.5 per cent., Kanazawa and Kochi 2.4 per cent., Hiroshima 2.1 per cent., Osaka and Nagoya 2 per cent., and Kyoto, Tokyo and Kobe 1.7 per cent. to 0.5 per cent. Only Yokohama remained stationary. The average price index numbers in these 13 cities run as follows: Kanazawa 94.0, Hiroshima 92.0, Kochi 91.0, Otaru 90.9, Sendai 90.8, Tokyo 89.1, Kyoto 88.4, Nagoya 88.2, Niigata 88.1, Fukuoka 87.6, Kobe 86.8, Osaka 85.5 and Yokohama 82.8.

INDEX NUMBER OF PRICES

(Compiled by the Ministry of Commerce and Industry)

Comparison of Wholesale and Retail Prices

(Base on December, 1929=100)

		Jan.	Feb.	March	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.

Commercial and Industrial Bodies

Important Commodities Guilds At the end of 1933 there were 818 Important Commodities Guilds representing 111 kinds of enterprises in Japan, a loss of 12 in number and gain of 1 in kind as compared with the previous year. Those which headed the list were textiles with 117, rice and cereals 64, lumber 48, soy and

Digitized by Google

"miso" 36. Federation of these guilds numbered 29.

Industrial Guilds At the end of 1933 the number of Industrial Guilds was 344 representing 52 kinds of enterprises, a gain of 15 (78%) in number and 16 (44%) in kind as compared with the previous year. Cotton textiles head the list with 77, silk, textiles come next with 31 followed by ceramics with 28 and ice manufacturers with 21, etc. There were 23 federations of these guilds.

Export Guilds In the same period, the number of Export Guilds was 45 representing 12 kinds of commodities, a gain of 15 (50%) in number, while the number of kind remained stationary.

Chambers of Commerce and Industry At the end of 1933 there were 97 Chambers of Commerce and Industry in Japan, with the total membership of 3,435 elected by 110,530 voters, an increase of 3 in the number of chambers, 107 in members and 10,116 in votes.

CHAPTER XI

FOREIGN TRADE

History of Development

Four Periods Japan's foreign trade for the last 70 years can be divided into four periods, namely, the first, before the Sino-Japanese War; the second, after the Sino-Japanese War to the outbreak of the Russo-Japanese War; the third, after the Russo-Japanese War to the outbreak of the World War; and the fourth, the period following the World War. In the early part of the Meiji Era Japan's foreign trade was insignificant, mostly being done through foreign firms, but several Japanese trading concerns were soon founded, among them being the Mitsui Bussan Kaisha, established in 1876, the Osaka Gumi, Morimura Gumi, Kwansai Boyeki Shokai and others. The Yokohama Specie Bank was founded in 1880 to serve as a monetary organ for traders engaged in foreign trade. The Nippon Yusen Kaisha and Osaka Shosen Kaisha were established in 1875 and 1874 respectively to carry on overseas marine transportation. The Tokyo Marine Insurance Company was founded in 1878. Thus important organizations for foreign trade were brought into being. During this first period Japan's economic conditions were primitive and her pursuits mostly agricultural. Her export volume between the first year of Meiji, 1868, and the 18th year was small—an average of one yen of exports per head of population. The import value was about the same. Even in 1893 the export and import totals were not more than ¥80,000,000 each. The Sino-Japanese War was an epoch in the national destiny of Japan. Foreign trade received a great fillip and considerable development was made. In 1894, when the war broke out between Japan and China, exports and imports were each more than ¥100,000,000, and in 1903, the end of the second period, exports amounted to ¥289,000,000 and imports ¥317,000,000.

The Navigation Law The navigation encouragement law was promulgated in 1896 and this accelerated the inauguration of overseas navigation by Japanese shipping companies. In connection with a revised tariff policy export duties were abolished and import duties on industrial materials were either abolished or reduced. Bar silver (Japan did not become a gold standard country until 1897) experienced a sharp drop before and after the War and the export trade was greatly stimulated thereby. In 1899, as a result of repeated efforts of the Government over many years, the trade conventions with foreign Powers were revised and the foreign settlement system for foreigners was replaced by one of mixed residence. Until 1887, about 87 per cent. of Japan's export trade and 88 per cent. of her import trade was handled by foreign merchants. In 1900, the foreigners' transactions in exports were 63 per cent. and Japanese transactions 37 per cent., the former's import transactions had decreased to 61 per cent. and Japanese transaction increased to 39 per cent. There was an excess of imports for every year of the period (1894-1903). The Russo-Japanese War imparted a far greater

Digitized by Google

impetus to the country's foreign trade than the Sino-Japanese War, the trade sphere was widened still further. Foreign capital flowed into the country for investment. Exports attained the ¥300,000,000 mark in 1904, and in 1913 they reached ¥632,000,000 and imports amounted to ¥729,000,000. One of the noteworthy events during the period was that the treaty revision of 1899 was further revised in 1901, the result being that Japan acquired perfect tariff autonomy, and was able to establish the foundation of a protective tariff policy. Industrial development resulted. In 1901, exports that went through foreign merchants were only 48 per cent., while those through Japanese merchants were 52 per cent., and imports handled by the former in the same year were 36 per cent., while those by Japanese were 64 per cent.,—a complete reversal of conditions that had existed during the early reign of Meiji.

The World War The greatest efforts on economic circles of Japan, qualitatively and quantitatively, resulted from the World War. Between 1914 and 1918, when the War was going on, Japanese economy and finance went through a sweeping change for the better and the unprecedented business boom lasted until March, 1920, when a great reaction took place. The suspension of imports into Japan by the War prompted the country to become self-sufficient in various lines of industry. Heavy demands for stores came in rapid succession from European countries. Japan became one of the principal countries of export to China, the South Seas and India, taking the place of Europe and America. The export activities and trade markets for Japanese commodities were considerably enlarged, increasing in proportion to the length of the war. Exports which totalled only ¥600,000,000 in 1914, the first year of the fourth period of the trade development of Japan, went above ¥1,100,000,000 in 1916, and in 1919 the amount exceeded ¥2,098,000,000, setting an all-time record. Imports which in 1914 were less than ¥600,000,000, increased to more than ¥1,000,000,000, in 1917 and finally reached ¥2,336,000,000 in 1920. Special mention must be made that for four years from 1916 to 1918, Japan witnessed a great excess of exports. The combined export excess for the period totalled ¥1,408,000,000. This trade prosperity naturally stimulated the shipping business. With the continued favourable trade balance, an influx of gold into Japan took place. For the seven years from 1915 to 1922 the influx of gold amounted to ¥1,180,000,000, and in addition Japan came to hold an enormous amount of specie abroad. The amount held by the Government and the Bank of Japan at the end of 1920 was ¥2,178,000,000, a record high amount for Japan. When the armistice was concluded in 1918, the heavy demand for munitions came to an end, and with the gradual restoration of European industries to their former conditions, the collapse of the Russian market through the Revolution, the exhaustion of European countries and the consequent sinking purchasing power, Japan's export trade turned for the worse during the latter half of 1920. The 1920 reaction threw Japanese economy into a great panic. Exports for 1921 made a sudden and substantial decrease to the ¥1,000,000,000 mark from the record level of ¥2,098,000,000 for 1919. Imports also went off remarkably. To make matters worse, trade reverted to the adverse balance of import excess after 1919, the largest adverse balance being in 1924 and 1925 consequent on the great Kanto earthquake and fire of 1923. Imports

Digitized by Google

for 1924 totalled ¥2,400,000,000, going above the previous record of ¥2,336,000,000 for 1920, and in 1925 the amount attained the considerable height of ¥2,500,000,000. This remarkable gain was due to heavy imports of materials needed for reconstruction work after the earthquake and fire. The Government exempted these imports from tariff duties. Due to the adverse trade balance, specie accumulated by Japan during the War boom was taken back by foreign countries. During the last 64 years, from 1868, the first year of Meiji, to 1932, only 20 years have seen an excess of exports over imports and the remaining 44 years have experienced an excess of imports over exports.

The Trade Returns The annual foreign trade figures from 1897 to 1934, taken from the Ministry of Finance reports and excluding the foreign trade of Korea and Formosa, follow. It may be added that the values of exports prior to 1904 represent the price at ports of destination, and those for that year and subsequent years, the price and packing charges. The values of imports prior to 1899 represent the original price only and those for that year and subsequent years, the cost, packing charges, freight, insurance and all other incidental expenses incurred up to the time of the arrival at the port of destination.

Year	Exports	Imports	Total	Excess of Imports over exports
	(In ¥ 1,000)			
1897	163,135	219,300	382,435	56,165

Trade Ports

On June 2 in the sixth year of Ansei, 1859, in the latter part of the Tokugawa Shogunate régime, Yokohama, Nagasaki and Hakodaté were opened to foreign trade. On December 7 in the 3rd year of the Keio Era (1867), Kobé was similarly opened and in the first year of the Meiji Era (1868) Osaka and Niigata were opened to international trade and commerce. In 1926 the total number of open ports in the Empire was 67, of which 41 were in Japan proper, 10 in Formosa, 11 in Korea and 5 in the South Sea islands. These were :

JAPAN PROPER: Yokohama, Nagasaki and Hakodaté (all opened in the 6th year of Ansei), Kobé (the 3rd year of Keio), Osaka and Niikata (the first year of Meiji), Ebisu (1869), Shimizu, Taketoyo, Yokkaichi, Shimonoseki, Moji, Hakata, Karatsu, Kuchinotsu, Izugahara, Sasuna, Shikami, Naha, Hamada, Sakai, Miyazu, Tsuruga, Nanao, Fushiki, Otaru, Kushiro, Muroran (all in 1899), Itozaki (1900), Wakamatsu (1902), Suminoe and Aomori (1904), Nagoya (1905), Miiké (1906), Otomari (1907), Muroran (1908), Kagoshima (1919), Imaharu, Tokuyama and Maoka (1922).

FORMOSA: Keelung, Tamsui, Anping, Takao, Kyuko, Goryu, Goro, Kako, Toseki and Mako.

KOREA: Jinsen, Gunsan, Moppo, Fusan, Chinnampo, Shingishu, Ryugampo, Gensan, Seishin, Joshin and Yuki.

SOUTH SEAS: Jaluit, Saipan, Kusaie, Angaur and Palau.

In 1873 Yokohama came to the topmost position in trade volume, next came Kobé, Nagasaki, Osaka and Hakodaté in the order mentioned. Since 1902 Osaka has outstripped Nagasaki and held the third most important position. Kobé overstepped Yokohama in 1893 and since then has occupied the premier position of all ports. Compared, Yokohama is the principal export port, while Kobé holds the first place for imports. The importance of Yokohama is due greatly to her geographical position, being the nearest port to America. She also has a good trade in silk textiles but holds second place to Kobé for the manufactured silks. Her imports consist of beans, wheat, oil, drugs, raw cotton, wool, iron, etc. Kobé is a great import port for grains, sugar, rubber, soda, chemical fertilizers, dyes, raw cotton, wool, pulp, iron and bean cake. Osaka's chief trade is in cotton goods : Moji is noted for being a large export and import port of sugar ; Nagoya for its shipments of porcelain and cotton cloth ; Shimizu for tea and tangerine oranges ; and Miiké for coal.

VESSELS ENTERED AT FIVE PRINCIPAL PORTS

Foreign Trade during the year 1933

Japan's foreign trade, excluding that of Chōsen (Korea) and Taiwan (Formosa), reached during 1933 a total value of ¥3,778,266,000 being made up of ¥1,861,046,000 of exports and ¥1,917,220,000 of imports. The excess of imports was ¥56,174,000. When compared with the returns for the preceding year, exports for 1933 showed an increase of ¥451,054,000 (32.0%), imports an increase of ¥485,759,000 (33.9%), the total of exports and imports an increase of ¥936,813,000 (33.0%), and the excess of imports an increase of ¥34,705,000 (161.7%).

In spite of the raising of customs tariffs, import quotas, and the system of import licenses as adopted by different countries along with the aggravation of the world economic depression, Japan's export trade has continued strikingly active during 1933. This development of the export trade extremely excited the public feeling in other countries and led to the boycott of Japanese goods all over the world. With the satisfactory proceeding of the Indo-Japanese Trade Conference and also with the appearance of some improvement in industrial conditions in the United States, however, our merchandise was exported in large amounts to various countries. Thus, the total of exports and imports showed a greater increase as compared with the preceding year.

With respect to the value of exports and imports of gold and silver, excluding those of Chōsen and Taiwan, the exports amounted to ¥28,608,000, imports to ¥125,000, and the excess of exports to ¥28,483,000.

Exports and imports during 1933, excluding those of Chōsen and Taiwan were as follows:

EXPORTS AND IMPORTS OF MERCHANDISE

(In ¥1,000)

	1933	1932	Increase (+) or Decrease (−)
Exports	1,861,046	1,409,992	+ 451,054
Imports	1,917,220	1,431,461	+ 485,759
Total	3,778,266	2,841,453	+ 936,813
Excess of Imports	56,174	21,469	+ 34,705

EXPORTS AND IMPORTS OF GOLD AND SILVER

(In ¥1,000)

	1933	1932	Increase (+) or Decrease (−)
Exports	28,608	121,378	− 92,770
Imports	125	140	− 15
Total	28,733	121,518	− 92,785
Excess of Exports	28,483	121,238	− 92,755

Export Trade

The export trade has, as in the preceding year, continued to increase during 1933. The export of such articles as raw silk, cotton tissues, silk tissues, rayon tissues, knitted goods, comestibles in tin and bottle and iron showed an increase in value. In particular, the rate of increase in comestibles in tin and bottle and iron was 106.3% and 182.7% respectively as against the preceding year. The study of the principal articles of export reveals that raw silk increased from ¥382,366,000 of the pre-

Digitized by Google

ceding year to ¥390,910,000 in 1933, cotton tissues from ¥288,713,000 to ¥383,215,000, silk and rayon tissues from ¥110,828,000 to ¥140,926,000, comestibles in tin and bottle from ¥22,774,000 to ¥46,984,000, and iron from ¥12,278,000 to ¥34,666,000. The export of cotton yarns, however, showed a decline compared with the preceding year. Speaking geographically, it is noted that exports to all continents showed increases; especially those to South American and African continents indicated greater increases.

Principal exports are given below:

(In ¥1,000)

Items	1933	1932	Ratio to Exports of 1932 %
Raw silk	390,901	382,366	102.2
Cotton tissues	383,215	288,713	132.7
Silk and rayon tissues	140,926	110,828	127.2
Comestibles in tin and bottle	46,984	22,774	206.3
Knitted goods	42,047	26,935	156.1
Potteries	35,634	22,937	155.4
Wheat flour	34,955	20,539	170.2
Iron	34,666	12,278	282.3
Boots, shoes and clogs	29,630	20,666	143.4
Vehicles and parts thereof	28,342	11,506	246.3
Iron manufactures	26,897	14,193	189.5
Toys	26,375	15,120	174.4
Machinery and parts thereof	25,857	10,943	236.3
Wood	18,638	11,329	164.5
Paper	17,687	14,022	126.1
Cotton yarns	15,712	21,547	72.9
Glass and manufactures	15,327	9,282	165.1
Lamps and parts thereof	15,863	12,754	124.4
Coal	14,158	13,450	105.3
Hats, caps and bonnets	13,927	7,713	180.6
Woollen tissues	12,377	4,481	276.2
Alcoholic liquors	10,808	8,188	132.0

EXPORTS CLASSIFIED BY CONTINENTS

(In ¥1,000)

Continents	1933 Value	1933 Ratio to Total Exports %	1932 Value	1932 Ratio to Total Exports %	Ratio to Exports of 1932 %
Asia	930,637	50.0	677,613	48.0	137.3
Europe	182,078	9.8	127,176	9.0	143.1

South America	30,379	1.6	13,133	0.9	231.3
Africa	137,239	7.4	85,695	6.1	160.1
Oceania	65,380	3.5	47,278	3.4	138.3
Total	1,861,045	100.0	1,409,991	100.0	132.0

Import Trade

As in the case of exports, almost all articles of import, with the exception of only two or three articles such as wheat and automobiles and parts thereof, showed in 1933 an increase in value as against 1932. The total value of imports showed an increase of 32.8% over the preceding year. In particular, the import of raw cotton increased from

Digitized by Google

¥477,401,000 of the preceding year to ¥604,847,000 in 1933, wool from ¥87,559,000 to ¥164,192,000, iron from ¥65,075,000 to ¥136,641,000, and mineral oil from ¥98,588,000 to ¥108,859,000. Turning to the imports aggregated by continents, they all showed increases; especially those from South America, Africa, and Oceania showed greater increases.

Principal imports are given below:

(In ¥1,000)

Items	1933	1932	Ratio to Imports of 1932
			%
Cotton in the seed and cotton grinned	604,847	477,401	126.7
Wool	164,192	87,559	187.5
Iron	136,641	65,075	210.0
Mineral oil	108,859	98,588	110.4
Machinery	72,658	60,573	120.0
Beans and peas	50,345	42,070	119.7

1934 Trade

The overseas trade of Japan in 1934 made a far more stride than in the preceding years, gains compared with 1933 being 17 per cent. in the exports and 19 per cent. in the imports and compared with 1931, the worst year for Japan since the World War, being 89 per cent. in the exports and 84 per cent. in the imports. The comparative figures for the last four years follow:

OVERSEAS TRADE OF JAPAN PROPER (¥1,000,000)

	1931	1932	1933	1934
Exports				
Value	1,147	1,410	1,861	2,172
Index	100	123	162	189
Imports				
Value	1,235	1,431	1,917	2,282
Index	100	116	155	184
Total				
Value	2,383	2,841	3,778	4,454
Index	100	119	159	186
Excess of Imports				
Value	89	21	56	111
Index	100	23	63	125

During the three years there took place marked changes in the components of the overseas trade of Japan. In the exports a noticeable increase was witnessed in the finished manufactures and a great decrease in the half finished goods. In raw materials too a sharp decline occurred. In the imports finished manufactures underwent a considerable shrinkage, while raw materials increased. As compared with 1929, the year which was very much analogous to 1934 in the briskness of trade, it is noticeable that there took place in these five years an increase of 44 per cent. in the exports of finished goods and a decline of 35 per cent. in the exports of raw materials and at the same time an increase of 12 per cent. in the imports of raw materials and a decrease of 17 per cent. in the imports of finished goods.

FOREIGN TRADE AS CATEGORIZED BY INDEX NUMBERS

(Average of 5 years, 1921-1925, taken as 100)

	1929	1931	1932	1933	1934
Exports					
Foodstuffs	149	96	97	147	160
Raw materials	87	44	50	72	93
Finished raw materials	109	52	60	67	62
Finished articles	144	82	108	159	207
Imports					
Foodstuffs	91	53	54	58	59
Raw materials	117	65	80	113	134
Finished raw materials	96	49	54	89	112
Finished articles	89	53	59	59	74

These changes in the components of the overseas trade of the country were caused by the accelerated industrialization of whole Japan coupled with the low exchange rate of the yen and the imposition of protective tariffs. Another noteworthy fact was the change that took place in the world markets for Japanese goods. In exports to North America there took place a great decrease due to the sharp drop of silk, but in all other continents extension reigned. In the total amount Asia leads the rest, but as viewed from the percentage of increase Central America ranks first at 175 per cent. followed by Africa and South America in order, and the last seat is occupied by Asia at 25 per cent. Compared with the conditions in 1931, excepting the United States which showed a loss of 6 per cent., all are showing a tremendous increase. In the Asiatic continent the increase was represented by above 131 per cent., in European Continent 118 per cent. in Oceania by 120 per

Digitized by Google

cent., in Africa by 21 per cent., in South America by 501 per cent. and in Central America by 2,230 per cent. The markets of Japan can conveniently be divided into the old and new, the former being the United States, China, Kwantung province, British India, and the Dutch East Indies. The latter is South and Central American, Africa, Oceania, etc. The increase to the new markets was 179 per cent. against 52 per cent. to the old markets.

PERCENTAGE OF INCREASE OF JAPAN'S TRADE BY CONTINENTS

	1934 (¥1,000)	Comparison with the Previous Year	Comparison with 1931

Important Foreign Trade Countries

Great Britain Early in Meiji Great Britain, China, the United States and France were the most important countries for Japan's export trade. In the import trade Great Britain, China, France and the United States were the principal countries, in that order. With a rapid gain in the export of raw silk in 1879, the importance of export countries was changed to the United States, China, France and Great Britain, although no change was noted in their precedence as import countries. A change came over the precedence in import countries in 1893 and India became the largest exporting country to Japan, being followed by Great Britain, the United States and China in that order. This was due to the rapid growth of the Japanese spinning industry, for which Indian cotton was needed. At present Great Britain comes 6th in order of Japan's export trade and 7th of Japan's import trade. When British India is included, however, she stands next to the U. S. A. both in buying Japanese commodities and in selling her goods to Japan.

The U. S. A. America's economic condition and her financial and tariff policy have a direct bearing on Japan's export trade and domestic economy, for Japan's trade with the United States is far in excess of that with any other country. The close Japan-American trade relations trace back to the visit of Commodore Matthew Perry to Japan in the 6th year of Kaéi, 1853. In the early stage the trade volume was less than that with Great Britain and France, but in 1879 Japan's exports to that country gained to more than ¥10,000,000, and America became Japan's largest customer, a position she has since retained. In 1904 Japan's exports to America reached the ¥100,000,000 mark; in 1915 they amounted to ¥204,000,000 and in 1919 to ¥828,000,000, and the record amount was ¥1,006,000,000 in 1925. In the following year the amount went off to ¥860,000,000, but this, as compared with the exports of ¥4,000,000 in 1874, was an increase by 215 times and was 40 per cent. of Japan's total trade volume. Raw silk, silk textiles, refined tea, straw-braid, fancy mats and porcelain have been the principal exports from the very beginning. Imports from America increased in consonance with exports. In 1874 the value of imports was just over ¥1,000,000, this, by 1905 had advanced to ¥100,000,000, and in 1920 the amount set an all-time record of ¥873,000,000. The 1926 figure of ¥680,000,000 was 680 times the 1874 trade volume and was 26 per cent. of Japan's total import value of that year. Imports from America consist of raw cotton, kerosene oil, wheat, machinery and iron. The most unique feature of the Japan-American trade was that the trade balance was continuously in favour of Japan. In the last 60 years of trade relations, all but 1900, 1905, 1918, 1920, 1921 & 1932 saw an excess of exports over imports in favour of Japan. The latest three years, however, it has been reversed in favour of America. In 1934 the total volume of Japan-American trade comprised 26 per cent. of the total of Japan's foreign trade in that year.

China Japan entered into formal trade relations with China in 1873. Like Japan's trade with other countries, Japan's trade with that country made distinct development with the Sino-Japanese War, Russo-Japanese War and World War. Exports, which in 1873 amounted to only ¥4,786,000, went up to as high

Digitized by Google

as ¥10,000,000 in each of the years 1887 and 1888. These years, however, were exceptional. The amount declined to ¥5,000,000 in 1889, but again advanced to the former level of ¥10,000,000 in 1896 and further to ¥117,000,000 in 1906 following the Russo-Japanese War. The largest amount, ¥597,000,000 was reached in 1919. In 1926 the amount still showed a total of ¥521,000,000, which meant 109 times the 1873 amount. The chief exports to China consist of marine products, spun silk, copper, cotton cloth, matches and sundry articles. Imports for 1873 from China amounted to ¥9,881,000; in 1907 the amount reached ¥60,000,000; and the all-time record amount was ¥484,000,000 in 1919. The 1926 figure of ¥396,000,000 meant 40 times the 1873 figure. Imports from China were kaoliang, beans, wild silk, raw cotton, wool, hides, ores and others. China supplies mostly raw materials to Japan who in return supplies manufactured goods. Japan's trade with China for 1931 experienced its worst set-back in recent years through the vigorous anti-Japanese movement following the outbreak of the Manchurian and Shanghai incidents. But the condition is turning for the better, regaining normal relation prior to the incidents, the trade between China (including Kwantung and Hong Kong) and Japan in 1934, amounting to ¥446,427,000 in Japan's export and ¥148,265,000 in the import.

The Invisible Trade

The invisible foreign trade of Japan for 1933 continued to show an excess of receipts according to the report of the Finance Ministry. It amounted to ¥66,233,000, an increase of ¥51,115,000, as compared with the previous year. This gain was mainly due to the increase in receipts from foreign investment in Japan and in collection of capital invested abroad. As compared with the previous year, an increase was recorded in all items except payments to foreigners which showed a decrease of over ¥10,000,000 and also collection of foreign capital invested in Japan which decreased over ¥90,000,000. All told the total increase in assets was ¥190,444,000 (25%) and that in liabilities ¥139,329,000 (18%).

Customs Duties

It was in 1859, at the time when most of the early commercial treaties with the Western Powers had been concluded, that custom-houses were for the first time established and customs duties were levied at a few open ports selected for the purpose. The customs tariff of that time was entirely determined by treaty; but the term of its operation was exceedingly short and the whole tariff was revised by treaty in 1866. This revised tariff kept our customs duties unchanged until 1899 when the treaties of commerce and navigation with the foreign Powers came into operation.

The coming into effect from 1899 of the revised commercial treaties with the foreign powers made it possible to bring into operation the general tariff which, combined with the conventional tariffs newly concluded, formed the customs tariff of our country. At the same time the export duties were entirely abolished.

In 1904 the urgent needs of the extraordinary fund in connection with the war with Russia led to the imposition of a special surtax on the customs duties as well as on the other taxes, and soon after the restoration of peace the entire customs tariff was revised and came into operation on October 1, 1906.

The Tariff Revision The Import Tariff Revision Bill passed the Imperial Diet in 1910 and was promulgated by Law No. 54 in April of the same year. The new tariff came into operation on July 17, 1911, but since then the tariff has been revised several times and at present the number of articles enumerated is 647, classified into seventeen groups; they are further subdivided and the duties thereon are converted as far as possible into specific duties. Raw materials are mostly duty-free; upon half-manufactured materials light duties are levied;

Digitized by Google

and upon manufactured goods the rates vary from 15% to 40%; but on many manufactured goods low rates are imposed, while the goods on which the duty of 40% is imposed are manufactured goods which are imported in small quantities. Again, though a duty of 50% is levied upon articles of luxury, their importation is also very small.

As the Tariff Conventions concluded with Great Britain and Germany were to terminate on July 16, 1911, and that with France on the 3rd of the following month, negotiations for their revision were opened with these countries prior to their termination. Although the new Tariff Conventions with Great Britain and Germany came into force simultaneously with the expiration of the old Convention, the new Convention with France could not be established before the expiration of the old; and accordingly a provisional Convention was concluded pending the establishment of the new Convention, which was put in operation on February 29th of the following year.

A new tariff convention was also concluded with Italy in June, 1913.

Tariff in Korea In conformity with the Imperial Declaration concerning the Annexation of Chosen in 1910, the tariff system of the former Korean Empire was left in force in the territory for ten years after the event. On expiration of the term of ten years on August 28, 1920, the tariff in force in Japan proper was applied to Chosen.

The Luxury Duties Under the law No. 24, promulgated on July 31, 1924, which regulates import duties on certain luxuries, a hundred per cent. ad valorem import duty was imposed for the time being on about one hundred and twenty kinds of goods which were designated as luxuries.

A partial amendment of the import duties on luxuries was made on April 1, 1925, exempting articles imported for industrial use, materials for re-export and certain other materials from the 100% duties.

Kwantung Province With the object of encouraging the industries in Kwantung Province and of promoting exports to the home country, portland cement and twenty-nine other articles produced in the province were exempted from import duties by the Act of June 18, 1925.

The Revision of 1926 Although several amendments in minor details had been made from time to time, the customs tariff of the country has remained practically unchanged since 1910, and has not been adapted to the great change in economic conditions at home and abroad. The Government, therefore, introduced into the Imperial Diet in 1926 a Bill proposing a general amendment embodying the following principles:

(a) Raw materials which are not produced or are scarce in this country are to be free of duties.

(b) Necessary protection is to be given to staple industries that have bright prospects for the future.

(c) Import duties are to be left untouched or are to be reduced with respect to foreign articles with which home produce is able to compete.

(d) Duties on the necessaries of daily life are to be reduced.

(e) In order to discourage consumption, high duties are to be imposed upon articles other than necessaries of daily life.

(f) The number of specific duties are to be increased and more minute classification of articles is to be made for convenience in the imposition of duties.

Tariff Revision for Kwantung Province An amendment was made as to the articles exempted from import duties under the preference given to Kwantung province, by adding soy-

Digitized by Google

bean oil and certain kinds of manufactured cloths to the free list. This amendment was put into effect on April 1, 1927.

For the customs tariff law and the customs duties on the principal commodities see Chapter VIII and Appendix.

Commerce Adjustment and Safeguarding Law

This law, intended to protect Japan's foreign trade, particularly against restrictive measures undertaken by other nations to which Japanese goods are exported, was adopted at the 65th session of the Imperial Diet and has been in force since May 1, 1934. According to a Foreign Office statement, the promulgation of this law has been made necessary, because of a growing tendency in other countries to ignore the fundamental economic principles of ministering to one another's wants and promoting through their cooperative efforts the progress and prosperity of mankind, which is reflected in their attempts to suppress importation of foreign goods by means of high tariffs, restriction of imports, etc., and particularly because of the increasing number of countries which are setting up barriers against Japan's export trade. The law is intended to enable Japan to adjust her trade to the above situation, to balance thereby her international payments, and at the same time to take, if necessary, appropriate measures for safeguarding her commerce. It is stipulated in the law that the Government, whenever they consider it specially necessary for the purpose of adjusting trade or safeguarding commerce in answer to the measures that have been, or are to be, taken by foreign countries, may, in accordance with provisions of Imperial Ordinance and with the approval of the Tariff Investigation Commission, in respect of specified articles, and during a specified period of time, impose on such articles, in addition to the import duties enumerated in the Import Tariff annexed to the Customs Tariff Law, import duties not exceeding in amount their value ; or reduce, or exempt them from, import duties ; or prohibit or restrict the exportation or importation thereof.

First Application of the Law On July 20, 1935, the Commerce Adjustment and Safeguarding Law was first applied against the chief imports into Japan from the Dominion of Canada, imposing 50 per cent. additional ad valorem duties upon them for a term of one year. The gist of the statement of the Foreign Office follows :

Under the Anglo-Japanese Treaty of Commerce and Navigation by which Canada is bound, Japan and Canada must accord to each other the most-favoured-nation treatment. In spite of this fact, under the pretext of the fall in the exchange value of our currency, Canada has, in the imposition of ad valorem duty on all classes of Japanese goods, been determining the value of Japanese goods in terms of Canadian currency according to the legal value of exchange (¥100 to $49.85) and making this the standard value for the imposition of tariffs. Not only so, but Canada has been levying on such Japanese goods as it deems of the same class or kind as those made in Canada, the so-called exchange dumping duty, which is equivalent to the difference between the converted value based on the legal exchange value, and the actual value according to the current exchange quotation (¥100 to about $29).

While the Canadian laws provide for the application of the said converted value for the assessment of tariffs and of the exchange dumping

Digitized by Google

duty on the products of all countries, about 20, whose currency has depreciated more than 5 per cent. in exchange value as compared with Canadian currency, yet as a matter of fact the products of only five countries besides Japan are affected. Furthermore, as the trade of those five countries with Canada is not only negligible but involves an extremely small amount of goods upon which the exchange dumping duty is levied, it is, in effect, only Japanese commodities that are subjected to gravely disadvantageous treatment.

While the Canadian Government is, under the pretext of safeguarding home industry, fixing the standard value of many foreign commodities by category for the assessment of tariffs, and making that value a basis for the levying of general ad valorem duties, and is collecting as a special duty the difference between such fixed standard value and the actual value of the commodities, an inordinately high value has been set upon Japanese goods. According to the investigations of the Japanese industrialists concerned, the import price inclusive of duty and taxes of not a few Japanese commodities in Canada is more than double the factory price of Canadian goods of a similar class or kind. This import price is said to be from three times to six or seven times the export price of those goods in Japan. Due to these circumstances, a decline has resulted in the export of these categories of Japanese merchandise, some of them actually decreasing to less than 10 per cent. of their value a few years ago. In fact, many Japanese who long resided in Canada and engaged in Japanese-Canadian trade, have returned to this country, being virtually put out of business.

The export of our goods to Canada, which has become increasingly difficult since the general revision upward of the Canadian tariff in 1930, was even more gravely hampered by the imposition, in the early part of 1932, of the exchange dumping and various other duties aforementioned. The Japanese Government, therefore, have been negotiating both at Tokyo and Ottawa for the rectification of such arbitrary imposition of duties, but the Canadian Government have failed to hold out any hopes as to the rectification of this attitude.

It is not the intention of our Government to ask for the establishment of an equilibrium of trade between Japan and Canada, although the balance has been unfavourable to us during recent years. All we ask is that for the sake of equity and fairness toward Japan, a good customer of Canada's, the Canadian Government should accord a really just treatment to our goods in a friendly spirit, as is the case with the United States of America, its neighbour, and with Australia, which, like Canada, belongs to the British Empire.

The Japanese Government, moreover, sharing the view of the British Government, hold the exchange dumping duty to be an infringement of the most-favoured-nation clause, and oppose absolutely its imposition. Especially do we believe it unfair for the Canadian Government to assess duties on the basis of the mint par, in complete disregard of the rise in the export prices of our goods, and to discriminate in the application of the exchange dumping duty against the goods of countries whose currency has depreciated, besides restricting severely the import of our own goods by levying on them special duties of an inordinately high rate, under the pretext of protecting home industries.

Digitized by Google

We have, therefore, demanded the actual rate of exchange; the abolition of the exchange dumping duty; proper rectification in the fixing of values for tariff assessment and the application of special duties; together with the just and precise treatment of our merchandise by the Canadian customs officials. It was in compliance with a request from the Canadian Government that we presented these concrete demands at the beginning of last month. Simultaneously, however, we demonstrated a spirit of accommodation by suggesting that we should not be averse to adopting, after mutual consultation, appropriate measures as to certain important commodities of Canada likely to be adversely affected, in consequence of their consent to our requests. After our repeated urging, the Canadian Government at last replied to our representation, on the 10th instant, but their views are found to be still far removed from our basic demands, and it has become quite clear that as a practical proposition the Canadian reply does not remove the embarrassments imposed on our exports. . . .

The step that is being taken by the Japanese Government is an inescapable reaction to the restrictive measures of Canada against our goods and does not exceed the scope and degree of such measures. Of course, our friendly feelings toward Canada and its people will not suffer any change. We shall further continue negotiations with the Canadian Government, requesting a reconsideration, and are even ready to suspend the measures to be put into effect under the present ordinance when a satisfactory settlement is reached. We most earnestly desire that the Canadian Government will not fail to appreciate fully our views and immediately set about the rectification of their present arbitrary measures in order to restore the trade relations of the two countries, thereby contributing to the enhancement of the happiness of the people of Japan and Canada. (See Appendix for the Imperial Ordinance.)

CHAPTER XII

INSURANCE

General Survey

Marine Insurance Comes First In Japan, as in most maritime countries, marine insurance preceded life insurance, but the margin of time separating the two was much narrower in Japan, for there was a difference of two years only. Following the Restoration, 1868, the feudal lords or daimyo were dispossessed of their domains, but the Meiji Government undertook to compensate them for the lands confiscated. The condition of Government finance, however, did not permit of the payment of large sums of cash to the daimyo and pension bonds were issued to them instead. Hachisuka, Ikeda, Daté and other powerful and rich lords searched for an outlet for their energies and surplus and decided on insurance and advanced a plan to form a marine and fire insurance business after the British system. A company was incorporated in Tokyo in January 1879, with Viscount Eiichi Shibusawa as the person most intimately concerned with the consummation of the plan, and Yataro Iwasaki, the founder of the Mitsubishi interest, as his able lieutenant. The initial capitalization was ¥650,000. Marquis Hachisuka was president and Viscount Shibusawa and Mr. Iwasaki advisers.

Life Insurance Follows The late Taizo Abé is the originator of life insurance in Japan. Two years after the introduction of marine insurance he founded the Meiji Life Insurance Company in September, 1881, with a capitalization of ¥150,000. The promoters of this company were mostly graduates of the Keio Gijuku (present Keio University). In 1888, the Teikoku Life Insurance Company was founded and the Nippon Life Insurance Company was incorporated in Osaka in the following year. Zenjiro Yasuda was the founder of the Meiji Fire Insurance Company, the first of the kind in Japan.

The Present Status

The home insurance business at present consists of 12 kinds, namely, life, military conscription, accident, marine, fire including forest fire, transport, automobile, burglary, glass, fidelity, engine and boiler and re-insurance. Conscription insurance is interesting as it cannot be considered as pure insurance. The idea is to provide relief to the parents of young men who are called up to serve their time in the army. The insurance is taken out at any time from birth to 15 years of age, then, when the boy is conscripted, at 20 years of age the sum contracted for is paid to his parents. In case the boy is not called upon to serve his time in the army the premium only is repaid and the assured persons, who are enrolled in the army, participate and the forfeited accrued interest of those not called up, together with that of those who have died before being conscripted. It is 36 years since the business was first commenced and four companies engage in it. Japan's grand total of insurance business for the last 12 business years, as prepared by the Ministry of Commerce and Industry, follows:

1933-34	85	151,526	1,985,929	25,444	33,109,146

In March, 1934 the number of insurance companies against loss was 51; total amount of their authorized capital reached ¥329,900,000 and paid-up capital ¥128,088,645. The number of companies was same while authorized capital and paid-up capital increased by ¥45,900,000(16%) and ¥29,446,145 (29%) respectively as compared with the previous year.

The number of insurance companies against death and conscription was 34, with total amount of authorized capital and fund ¥42,650,000 and paid-up capital ¥23,437,500. In comparison with the previous year the number decreased by 4, paid-up capital increased by ¥717,000 (2%) while authorized capital decreased by ¥4,230,000 (9%).

The number and amount of new contracts of these companies in 1933-34 and their comparison with the previous year are given below:

Kind of Insurance	Contracts made in 1933-34		Comparison with the previous year					
	Number	Amount		Number	%		Amount	%

Post Office Life Insurance

With a view to promoting the welfare of the middle and lower classes of the community, the Post Office Life Insurance Law (Law No. 42) and the Post Office Life Insurance Special Account Law (Law No. 43) were promulgated on July 8th, 1916, the former being put into effect on October 1st and the latter on August 20th of the same year. The main features of the life insurance schemes may be summarized as follows :

1. This insurance is the work of the Government and is to be dealt with at the post offices.

2. The amount of insurance for a person will be from ¥20 up to ¥450.

3. The insured need not be subjected to any physical examination.

4. If the insured die within one and a half year from the conclusion of the insurance contract by some causes other than the calamities or the infectious diseases specified in law, a portion of the amount insured will not be paid.

5. This insurance is divided into Whole Life, Endowment and Infantile. Endowment policies are divid-

Digitized by Google

ed into seven kinds of the terms of 10 years, 15 years, 20 years, 25 years, 30 years, 35 years and 40 years. Infantile policies are, to present, either 15 years or 20 years endowment.

6. The age of a person to be newly insured must be between 3 and 60 years.

7. The Mortality Table constituting a basis for the computation of premium was compiled by adding 20% to the Mortality Rates of the Japanese population under Table No. 2 published in 1912 by the Government Statistics Bureau. The interest on premiums is 3½% per annum.

8. The premiums are to be paid monthly. Those who have difficulty in monthly payment of the premiums, such as seamen, emigrants and farmers, are allowed to pay the premiums in advance. In such case, the prescribed premiums are reduced.

9. The period within which premiums should be paid in is fixed at one month, and two months' grace is allowed.

10. Within one year after the lapse of the policy, it may be revived.

11. When, after the conclusion of the contract, the insured either loses one or both of their limbs or becomes blind of both eyes, the future premiums need not be paid.

Besides whenever a policy has been in force for a period of thirty years and the insured person has arrived at the age of 70, the policy holder concerned may propose to have his future premiums paid up.

12. When, after the lapse of five years since the conclusion of the contract, the payment of the insured sum or the repayment of the paid-in premium is made, the beneficiary shall receive an additional sum as a rebate.

13. A loan may be allowed on the application of the insurer, not exceeding the amount which is to be paid back on the cancellation of the insurance contract.

14. In order to maintain and promote the health of the Health Consultation Service Regulation, 1922, so far been established in principal cities.

15. Beneficiaries or policy-holders are required to ask the judgment of the Post Office Life Insurance Committee of Inquiry prior to legal action against the Government for their contracts.

Post Office Life Annuities

While the history of the Post Office Life Annuities may be traced as far back as 1897, the authorities concerned thought it wise to introduce Post Office Life Insurance first and see how this would work, until, in 1926, changing social conditions and the maturing for the first time of the Post Office Life Insurance Endowment Policies gave favourable indications for the Annuity business, and a bill in this connection was introduced and unanimously approved by the Diet in March.

The main features of the system which came into operation on October 1st of the same year may be summarized as follows:

1. The annuity business is to be administered by the same system as that of the Post Office Life Insurance.

2. Annuities that may be purchased are divided into:

(1) Immediate Life Annuities.
(2) Deferred Life Annuities.
  (a) Annuities commencing at the age of 50.
  (b) Annuities commencing at the age of 55.
  (c) Annuities commencing at the age of 60.
  (d) Annuities commencing at the age of 65.

Digitized by Google

3. The Post Office Life Annuities may be purchased either with or without provision for the return of the purchase money, and purchasers must select one of these two plans when they make their application.

4. The ages of persons entitled to become annuitants under this system must fall, in the case of Immediate Life Annuities between 40 and 80 inclusive and in the case of Deferred Life Annuities between 12 and 60 both inclusive.

5. The premium rates are calculated on the mortality rates by deducting 20 per cent. for males and 30 per cent. for females from the general mortality rate of the Japanese population.

The rate of interest allowed in the calculation of the value of annuities under the instalment payment plan is 5 per cent. and under the single payment plan, such rate shall be determined, from time to time, by the Minister of Communications upon the basis of the current market price of public bonds. The rate is fixed at 5½% per cent. for the present.

The reserves to be maintained against policies are worked out by the net premium method.

6. The maximum annuity that can be purchased on the life of any one person is ₹2,400, and the minimum is ₹120 under the instalment premium plan or ₹12 under the single premium plan.

7. Premiums are payable either in a single sum or by instalments; in the latter case, the premium payment is divided into four periods, namely, 10 year payment, 15 year payment, 20 year payment and ordinary payment, and the premium may also be paid yearly, half yearly or quarterly. All premiums are payable either at any post office designated by the purchaser or at his residence to the collector.

8. In the case of an Immediate Annuity, the annuity will begin on the date of contract and continue from that time until the death of the annuitant. In the case of a Deferred Annuity, the annuity will begin on the date of the annuitant's reaching a certain specified age and continue from that time until the death of the annuitant.

9. Annuitants are given the right, subject to certain conditions to claim a change in their contracts.

10. Should events stipulated as a reason for the return of purchase money actually occur, such return is to be made according to prescribed conditions.

11. Provided a contract reserves the right for the purchaser or the annuitant to claim refund of premiums paid, such person may avail himself of a cash loan of not more than 50% of the premiums paid, provided that the sum is not less than ₹20 per contract, or, if the proceeds are to be applied to the payment of the premium, a sum equal to one year's premiums.

12. Annuitants or purchasers are requested, before bringing a civil action against the Government in respect of their contract, to submit their cases before the Post Office Life Insurance Committee of Inquiry.

13. A special account is established of the management of this business.

Welfare Service for the Insured

Health service is one of the subjects which have commanded constant attention since the very inception of the system of Post Office Life Insurance in this country. Of the various kinds of health campaigns which have been embarked upon by the Bureau with a view to maintaining and promoting the health of the insured, the establishment of the Health Consultation Offices was first realized in 1922. At present there are 135 offices in 127 centres of the country. The Central Office is in charge of the work of replying to any consultation involving any of the following :

1) Serochemostrical research
2) Biochemistical research
3) Bacteriological rersearch
4) Roentgen diagnosis
5) Hygienic research
6) Animal experiment
7) Complicated diagnosis of initial tuberculosis, carcinoma, etc.

State Live-Stock Insurance

The live stock insurance is making a steadily prosperous business. In March, 1930 there were only 6 societies engaged in this live stock insurance business, with only 1,304 head having been insured. In March, 1930 the aggregate amount insured was ¥127,622 which increased to ¥13,024,819 in March, 1933 and to ¥19,491,871 in March, 1934, with premiums received increasing from ¥2,166 in March, 1930 to ¥424,650 in March, 1934. The following shows the business results of the last four years:

LIVE STOCK INSURANCE

March of	Insurance societies	Insured cattle	Insured amount	Premiums received	Claims paid
			Yen	Yen	Yen
1931	102	41,474	4,156,117	83,277	20,749

	Horses	98,194	7,185,813	221,631

State Health Insurance

At the end of the fiscal year 1932 there were 1,720,199 persons insured by the State Health Insurance as against 1,633,237 in 1931, of which 1,684,509 were persons insured compulsorily as against 1,599,230 in 1931, the increase being 86,962 in the former and 1,707 in the latter case. Premiums collected for 1932 totalled ¥26,119,521 as against ¥27,582,195 for 1931, ¥33,213,428 for 1930, ¥37,128,306 for 1929 and ¥36,817,377 for 1928. During the corresponding 5 years something between ¥23,000,000 and ¥33,000,000 was paid out annually to the beneficiaries. For full particulars figures follow:

HEALTH INSURANCE

Actuarial Work

The Japanese Government began in 1927 the actuarial work of compiling "New Experience" mortality tables from the materials of ordinary life policies in 19 home life insurance companies, whose records escaped from burning in the Great Earthquake and Fire of 1932. The materials of the 19 companies used for this comprehensive work were for males 3,565,574 policies with ¥3,854,943,000, for females 1,116,549 policies with ¥892,335,000, covering the period of 15 years from 1912. The work was conducted under the special charge of the Insurance Bureau in the Ministry of Commerce and Industry, using perforated cards and statistical machines of the Hollerith Accounting Company. After four full years the work was completed, at the end of March, 1931. Some important features of this New Table are as follows:

(1) An unprecedentedly large number of materials was used,

(2) The computation of the rate of mortality was by the policy year method, the age at entry was taken from the nearest birthday and the duration by the nearest method.

(3) The number of policies and amounts insured are both used as the basis for determining "qx" (the Japanese 3 Life Office Table is based on the lives insured only). In Full Aggregate Tables the rate of mortality and the expectation of life based on amounts insured are very favourable, for both males and females of every age. But in Truncated Tables the same tendencies were not observed.

(4) Deaths from influenza 1918-1920 (for males 6,143 policies with ¥4,351,000, for females 2,200 policies with ¥1,353,700) and from the great Earthquake-Fire of 1923 (for males 2,336 policies with ¥3,215,500, for female 1,117 policies with ¥1,066,500) were included in the materials. The effects were found to be about 4%.

(5) Days of grace were excluded in computing the rates of mortality (contrary to the practice in Japanese 3 Life Office Table) causing about 2% plus (males and females) in the Full Aggregate Table, but in the Truncated Aggregate Table the influence has not been so markedly observed.

(6) In Japan, before 1872, the lunar calendar system was used, so the ages of the persons who were born before 1872 have been recalculated on the solar calendar system.

(7) Compared with the Japanese 3 Office Table the rate of mortality in the New Full Aggregate Table shows very favourable tendencies except for men between the ages of 25 and 40, and in New Truncated Aggregate Tables the tendencies are quite remarkable. If allowances were to be made for the points mentioned in (4) and (5) there are good reasons to believe that the experienced mortality in Japan would

Digitized by Google

show better figures throughout every age.

(8) Compared with Japanese Population Table No. 4, the figures in the New Table for males are less than those of the Population Table except for old ages; and for females except for middle ages, they are higher than those of the Population Table.

(9) The following tables show the comparisons of the New Japanese Experience Table, Japanese 3 Office Table and Japanese Population Table No. 4, which is prepared by Mr. Takejiro Sumio, an actuary:

CHAPTER XIII

AGRICULTURE

General Survey

Shogunate to Meiji Era Under the Tokugawa Shogunate farmers were restricted as to the kinds of their products, while the favoured few were given license for the exclusive cultivation of sugar cane and a few other products. Not only did the statutory ban come direct from the Shogunate, but feudal clan governments, in their turn, put on their own restrictions and handed out their own favours. The farmers were unable to escape from these restrictions, one feudal government might be less strict than another and the tendency would be for an efflux of farmers from the areas with stringent regulations to the areas more lenient, but the Government prevented such migration by prohibiting the sale of cultivated land. As the feudal clans strove after the attainment of a position of self-sufficiency in foodstuffs, the majority of the farmers were compelled to centre their energies on the production of rice and barley, the main foods of the Japanese people.

Export Ban Raised Like the Tokugawa régime, the Meiji Government concentrated its energy on agricultural development, but in a more informed manner. The export of rice and barley, which was banned by the Tokugawas, was permitted by the Meiji Government from January, 1872, the fifth year of Meiji, and since then the export of rice has been made free in principle, although limits have been imposed occasionally, and for short times, because of the need of regulating the price of rice. The reason for the Government initiating rice exports was that it had decided to break away from the centuries' old custom of having taxes paid in rice and accept monetary payments only. It possessed a large amount of rice in its warehouses, an amount which was ever increasing, and this fact prompted it to dispose of its stocks abroad to prevent the drop of rice prices and avert the consequent blow to Government finance. The Government consigned the rice to a British trading concern, Walsh and Hall. The export lasted for two years, to January, 1874, and during this period 1,197,843 koku were shipped to Hongkong, Amoy, Shanghai, Swatow, Fukien, Sydney, Melbourne, London and San Francisco. By this sale, the Government obtained ¥4,925,905. Trade conditions abroad at the time were very bad and the amount the Government received was about ¥1,420,000 less than was expected might be realized from a sale at home, but it had the desired effect of preventing a fall in domestic prices. After all, the greater part of the rice had been taken over, without payment from the Tokugawa Shogunate and feudal clans, so the Government was by no means a loser on the transaction, and the farmers benefitted as farm products were emancipated from all restrictions on trading. The Tokugawa ban on the sale of land was removed in part in 1872. By removing the ban the Meiji Government recognized the private ownership of land and, furthermore, made the sale and

Digitized by Google

mortgaging of it easy by adopting a system of land certificates.

Relief of Unemployed Samurai The majority of samurai were naturally thrown into unemployment by the Restoration of Meiji, and as they were the warrior class their unemployment was a great menace to the new Government. In order to give them proper employment the Government decided to encourage them in agricultural pursuits and as Hokkaido, the Ogasawara (Bonin) Islands, Sambongihara (Aomori prefecture) and Koganegahara (Chiba prefecture) required developing, the Government, in concert with former feudal lords, sent batches of samurai immigrants to these districts. A liberal subsidy was given to them, and as the results proved satisfactory the Government was successful in tiding over the possible crisis coming from a sudden increase of jobless samurai.

The Komaba School Toshimichi Okubo, one of the greatest figures of the Restoration, concentrated his energy on agricultural development. The Komaba Agricultural School, Tokyo, predecessor to the College of Agriculture of the Tokyo Imperial University, was founded in 1877 through his efforts. The Government protection for agricultural development was thoroughgoing. The appropriation of funds, establishment of agricultural schools and experimental stations, importation and application of Western agricultural technique, plantation of beet sugar, sheep-raising, cattle-breeding and sundry other necessary steps for agricultural improvement were adopted.

Agricultural Encouragement

The Government Activities George A. H. Hall, an American agricultural expert, was engaged by the Government in 1871 as an adviser on live-stock breeding and farming. The importation of cotton seeds from the Netherlands, the opening of the Komaba Agricultural Experimental Station, and sundry other enterprises were undertaken. In 1875, the Government sent abroad officials and students to study agriculture. A sheep-raising industry was sanctioned and an eight year plan to bring the industry to an advanced stage of efficiency was devised. Farms were selected in three villages in Chiba prefecture and the enterprise was under the supervision of American experts. Sheep were imported from Australia, America and China. The Senju Woollen Cloth Manufacturing Co., still in existence under Government management, was established in September, 1879. Beet sugar cultivation was started with the erection of a sugar refining mill at Mombetsu, Hokkaido, in 1879, with Government support. The expenses were ¥136,460. Work was started in 1881. The plantation area was 120 cho, and this was divided and allotted to 440 farm houses. Due to inexperience only 15,000 kin of sugar were produced and the plan to manufacture 700,000 kin of sugar yearly ended in failure. All these protective steps of the Government came to an end with the death of Okubo and the farming industry was left to look after itself until 1890.

New Ministry Created The Government in April, 1881, established the Ministry of Agriculture and Commerce, against public opinion, but its general policy seemed to be one of laisser faire and, in consequence, various Government enterprises were transferred to private management. For the ten years from the Sino-Japanese War, 1894-95, to the Russo-Japanese War, 1904-5, a policy of protection was resorted to, and various protective measures were adopted, such as enforcement of the Japan Hypothec Bank Law, Agricultural

Digitized by Google

and Industrial Bank Law, Arable Land Readjustment Law, Agricultural Society Law, Co-operative Society Law, Staple Produce Traders' Association Law, and the Prefecture Agricultural Experimental Station Treasury Subsidization Law.

Purpose of Measures Taken Not only were these measures intended for to protect the farmers from troubles peculiar to their own industry but also to protect them from the increase of troubles arising from the growth of other industry and competition with foreign farm products. Farm products in Japan were diminishing in quantity and quality through sundry conditions, such as the climate, labour wages and Japan's changing social and international relations. With the promotion of foreign trade, cheaper-priced farm products such as raw cotton, indigo and beans began to be imported in large quantities and, when the occupation of Formosa as the result of the Sino-Japanese War resulted in a rapid expansion of sugar cultivation in that region, large-scale enterprises at home were rendered unnecessary. The import tariff on raw cotton was cancelled in April, 1896, and domestic plantations ceased to exist.

Subsidies and Tariff After the Sino-Japanese War bankruptcy was very rife among the farmers and relief was given to them by the passing of the Agricultural Society Law in 1899, by which the societies were to be given an annual subsidy of ¥150,000. In 1906, rice and unhulled rice were taken off the free list and a duty of 64 sen per 100 kin was imposed on their importation, the tariff on barley was raised to 57 sen from 10.1 sen per 100 kin and that on wheat raised to 47 sen from 15.3 sen per 100 kin and, in 1911, the tariff on rice and unhulled rice was raised to ¥1 and that on wheat to 77 sen.

Other Encouragement During the first decade or so of the century the Government also paid much attention to agriculture in other directions, for instance, the Treasury was authorized to subsidize research into and relieve sericulturists whose silk-worms had suffered from disease. An Increased Mulberry Growth Encouragement Fund, Land Improvement Encouragement Fund, Insect Ravage Prevention Fund and certain other funds and subsidies were paid out of the Treasury. As foreign rice and wheat were heavily imported agricultural interests suffered, a suffering that was not mitigated by the inflow of new capital, for capital was now being centralized in the cities and farmers, ever in constant financial difficulties, were compelled to borrow from money lenders at high rates of interest. Educated landlords found it advisable to give up farming and rural communities lost their leadership while urban industry gained.

The World War The World War promptly affected agriculture. Production in foreign countries fell, and as the prices of agricultural products rose Japanese foodstuffs were exported in large quantities. In 1914 the export value of cereals, flour and starch totalled ¥9,000,000, in the following year it increased to ¥24,000,000, in 1916 it was ¥36,000,000, in 1917 it was ¥79,000,000, and in 1918 passed the ¥100,000,000 mark. There was also an increased home demand, the cities were enjoying unprecedented prosperity and while the prosperity lasted the farmers benefitted, but with the termination of the war reaction set in, prices dropped, and agriculture found itself in the well of depression from which it has not yet extricated itself. The largest area under cultivation was

Digitized by Google

6,162,000 chobu, in 1921, but since then the area has kept declining.

Gold Embargo The replacement of the gold embargo enabled Japan to dodge the immediate settlement of its most important domestic problem, that of the farmers. The factors entering the equation were many and complicated, bearing directly not only upon the living standards of the agricultural community, which constitutes 46 per cent. of Japan's population, but upon the solvency of the banks. Before the re-imposition of the gold embargo, rice was selling at ¥17 per koku, against a cost of production estimated at about ¥30. Making up this high cost of production were dear money (the farmer pays 10 or 11 per cent. on his borrowings), high taxes (the farmer with a profit pays more than double the merchant with a profit and infinitely more when profits are lacking), the cost of fertilizers, and the cost of living (forced upward over a period of years by a rising tariff wall). Inability of the farms to pay taxes and interest had forced down the prices of real estate. Between the financial panic of 1927 and the replacement of the gold ban in December, 1931, such prices had fallen between 30 and 50 per cent., depending on locality. Lenders on rural real estate were carrying paper losses of between ¥500,000,000 and ¥625,000,000 the figure representing the difference between the current market price of the land and the amounts due, including defaults in interest and instalments. The losses represented between 20 and 25 per cent. of the value of the total agricultural mortgages outstanding.

An Analysis Assuming that the ¥2,700,000,000 of outstanding loans were on a 50 per cent. basis, the value of the land involved is ¥5,400,000,000, or 41 per cent. of the total value of farmlands in 1931, and the average amount of debt on each cho of land on which borrowings have been made is ¥2,058, an average of ¥226 a year in interest alone. The interest burden on each koku of rice produced on such debt-laden land is ¥12.20. If the 1924 valuation of ¥5,680 per cho were taken as averaged, the debt burden per debt-laden cho would rise to ¥2,813, and the annual interest burden per koku of rice to ¥16.70.

Lasd Values Land values went up sharply during the World War and post-war boom years. Between 1917 and 1924 they were at their peak, between 1924 and 1927 they fell but slightly, but between the 1927 panic and the replacement of the gold embargo at the end of 1931 they fell about 30 per cent. The effect of this decline in farm land value can be estimated from the following figures, which represent outstanding loans of the Hypothec Bank of Japan and of all the prefectural agricultural and industrial banks at year-ends:

End of	Loans	Average price per cho
1917	¥391,235,000	
1918	422,511,000	¥4,330
1920	630,444,000	5,940
1924	1,119,216,000	5,680
1927	1,407,718,000	5,460
1931	1,724,560,000	4,110
1932	1,843,596,000	3,880

The figures in the right-hand column above are those of the Hypothec Bank of Japan.

Farm Households and Arable Land

Farm Households Number of farm households totalled 5,621,535 at the end of 1933, which figure holds 45% of the total number of households in Japan Proper. Comparison with that of the previous year indicates decrease of 20,974 (0.4%).

The review of the ten preceding years reveals the trend of slow but

Digitized by Google

uninterrupted increase in the number, although the percentage held by it to the total households has been on the yearly decline.

As classified by those principally engaged and those subsidiarily engaged in agriculture, the figure consists of 4,126,052 (73%) of the former, increasing by 9,374 (0.2%) and 1,495,483 (27%) of the latter, lower by 30,348 (2%), both as compared with the figures of the previous year. During the ten preceding years steady upward trend is indicated by the former, the latter pursuing the contrary course.

Farm households cultivating their own lands numbered 1,745,847 (31%), while the number of tenant-farmers and households cultivating their own lands together with those leased being 1,499,855 (27%) and 2,375,833 (42%) respectively.

The trend followed by those cultivating their own lands during the past ten years and those cultivating their own lands together with those leased has been a slow growth, tenant-farmers indicating a tendency towards decline in number recently.

As classified by size of agricultural area operated, number of farm households of those operating area under 0.50 ha. 1,920,643 (34%), those ranging from 0.50 ha. to under 0.99 ha. 1,927,660 (34%), those from 0.99 ha. to under 1.98 ha. 1,247,517 (22%), and those from 1.98 ha. and over 525,715 (10%).

To summarize, those operating on a small scale have been increasing, while those on a medium and a large scale showed a marked drop.

Owners of Arable-lands Number of owners of arable-lands totalled 5,119,936 at the end of 1933 decreasing from that of the previous year by 402 (0.01%). As divided according to area owned, this figure is made up of those owning area under 0.50 ha. which leads the list, being 2,550,437 (49.8%), those owning from 0.50 ha. to under 0.99 ha. numbered 1,284,076 (25.0%). In this way the more the area, the less the number of owners, and so those owning 49.59 ha. and over are only 3,634 (0.1%) in numbr. In the light of the tendency during the previous ten years uninterrupted increase is traceable in the total number, while by reference to the tendency of number fluctuation according to area owned, those under 2.98 ha. are pursuing a steady upward course, those owning more than 2.98 ha. showing the reverse trend.

Area of Arable-lands Area of arable-lands at the end of 1933 was computed at 5,978,939.90 ha., occupying 15% of the total area of Japan proper. This figure consists of 3,198,970.21 ha. (54%) of rice-fields and 2,779,969.69 ha. (46%) of upland-farms. Comparison of these figures with those of the previous year indicates increase of 5,645.85 ha. (0.2%) on the part of the former and increase of 30,778.61 ha. (1.1%) on the latter, both making increase of 36,424.46 ha. (0.6%) in the total area. As reviewed from the point of the tendency during the ten preceding years, area of rice-fields has been on the gradual increase, that of upland-farms pursuing the downward direction.

Classified into those cultivated by owners of lands and those by tenant-farmers, area cultivated by the former was 3,159,188.93 ha. (53%), increasing by 21,184.77 ha. (0.7%), the latter being 2,819,750.97 ha. (47%), higher by 15,239.69 ha. (0.5%), both as against the figures of the previous year.

Area of Rice Fields The area of rice fields and rice production follow:

Year	Rice fields (1,000 chobu)	Rice production (1,000 koku)	Per tan production (koku)
1926	3,158	55,598	1.760
1927	3,174	62,103	1.957
1928	3,192	60,303	1.889
1929	3,211	59,558	1.855
1930	3,239	66,876	2.064
1931	3,249	55,215	1.700
1927–1931 5 year average	3,213	60,811	1.892
1932	3,257	60,390	1.845
1933	3,173	70,829	2.232
1934	3,172	51,840	1.634

Korean Rice Crop The total rice crop in Korea for 1933 totalled 18,190,000 koku, an increase of 1,844,000 koku from the 1932 total. Since rice is more expensive than millet, the Korean eats millet imported from Manchuria and exports his rice to Japan. That, at least, is the theory. In recent years, however, the Korean Government-General's efforts to promote rice production have been so successful that the imports of millet no longer occupy the important position they once did. Korea is consuming more rice. Figures follow:

RICE CONDITION IN KOREA

Year	Production	Foreign rice imports (In 1,000 koku)	Exports to Japan Proper
1924	13,219	926	4,428
1925	14,773	504	5,213
1926	15,300	821	5,903
1927	17,298	361	7,068
1928	13,511	429	5,377
1929	13,703	586	5,167
1930	19,183	17	7,929
1931	15,873	233	7,197
1932	16,346	106	—
1933	18,192	—	7,990
1934	16,717	—	—

Formosan Rice Crop Formosa had a good crop in 1932 and consequently exported more to Japan proper. Its gains more than offset the Korean losses. The 1933 production of rice was also on the increase, the crop being 8,666,000 koku, an increase of 593,000 koku compared with 1932. Its export to Japan proper is also on the increase, the 1933 export figure being 4,123,000 koku against 3,330,000 koku of the previous year.

RICE CONDITION IN FORMOSA

Year	Production	Foreign rice imports (In 1,000 koku)	Exports to Japan Proper
1926	6,101	403	2,437
1927	6,637	799	2,703
1928	6,841	287	2,387
1929	6,451	551	2,172
1930	7,111	68	2,071
1931	7,516	6	2,663
1932	8,072	150	3,333
1933	8,666	—	4,123
1934	9,088	—	—

Imports of Rice Imports of foreign rice into Japan during 1933 amounted to 998,000 koku, a gain of 13,000 koku over 1932. Added to the imports from Korea and Formosa, these brought the total imports to 12,747,000 koku, a gain of 1,144,000 koku over 1932. Figures follow:

IMPORTS OF RICE

Year	Korean rice	Formosan rice	Foreign rice	Total
		(In 1,000 koku)		
1923	3,453	1,131	1,620	6,208
1924	4,547	1,658	3,326	9,538
1926	5,213	2,186	2,141	9,541
1927	5,903	2,637	4,128	12,670
1928	7,068	2,430	1,753	11,255
1929	5,377	2,253	1,277	8,909
1930	5,167	2,185	1,248	8,602
1931	7,992	2,663	829	11,486
1932	7,198	3,420	985	11,603
1933	7,531	4,216	998	12,747

The Uses of Rice In the following there is shown rice consumption as classified by uses in 1930:

Uses	Consumption	Percentage of total
	(In 1,000 koku)	
Seeds	816	1.1
Eating	59,471	86.4
Making Saké	3,593	5.2
Making Mochi (rice cake)	3,393	4.9
Making Miso (bean mash) and Soy	478	0.6
Making Cake and Amé (Jelly)	774	1.1
Paste	35	—
Others	213	0.3
Total	68,776	100.0

Production Cost

The cost of production of rice for 1933 in comparison with the previous two years was, according to an investigation made by the Imperial Agricultural Society, as follows:

	1933	1932	1931
Production cost per koku	¥ 24.97	21.83	23.07
Production cost per tan (.245 acre)	63.57	58.90	58.05

The production cost per tan includes the following:

	1933	1932	1931
Direct production cost	¥ 33.22	30.39	29.60
Indirect production cost	30.35	28.51	28.45

1934 Rice Crop Rice crops in 1934 amounted to 51,839,629 koku, being a decrease of 18,989,488 koku (26.8%) as compared with the previous year and of 10,733,913 koku (17.2%) as compared with the average for the five years. The total rice fields under cultivation in 1934 covered an area of 31,728,739 tan, and the average yield per tan was 1.634 koku. This shrinkage in production was due to the poor harvests in the north eastern districts owing to the untimely cool weather which had checked growth of rice plants and, on the other hand, to the dearth of rainfall in Kyushu and Shikoku districts. The first forecast on September 20 was estimated at 57,026,780 koku. But the typhoon of September 21 brought about heavy damages to the rice crops in Kansai districts.

Digitized by Google

The weather that followed was also unusually unseasonable, low in temperature and scanty in sunshine. The second forecast on Oct. 31, 1934, reported a decrease of 6,280,640 koku as compared with the first estimate. But the recovery of weather since the second estimate gave a result which saw an increase of 1,093,489 koku (2.2%).

Farm Relief Measures

Frozen Real Estate Liquidation Loans Loans secured by mortgages of real estate amounted to about ¥6,000,000,000, of which those guaranteed by ordinary banks totalled ¥1,650,000,000. Because of the great depression in agriculture relief had to be given. Three measures were taken. The first was to advance ¥50,000,000 through the Japan Hypothec Bank, prefectural hypothec banks and Hokkaido Colonization Bank to ordinary banks to commence liquidation of outstanding loans, but, due to the fact that no Government guarantee for the losses that might be sustained by those banks was provided for legally, they hesitated to take up the business. A bill providing that the Government should guarantee their losses to the maximum amount of ¥100,000,000 was submitted to and passed by the 63rd ordinary Diet session in December, 1932, and liquidation started.

Farmers demanded a moratorium on their debts, but the Government found it impossible to accept the demand and agreed to postpone the redemption of the principal and interest of their debts to the Deposit Bureau for three years, commencing the 1932-33 year and at the same time decided to advance ¥65,000,000 to farmers for readjustment of these debts. The third measure taken by the Government was to guarantee probable losses of the Central Bank for Co-operative Societies to the amount of ¥30,000,000. Out of about ¥1,000,000,000 loans to farmers, medium-sized business men and industrialists by the credit societies, ¥300,000,000 was estimated as bad debts. In order to smooth out this financial difficulty, the Government decided to make the Central Bank for Co-operative Societies advance loans to the amount of ¥100,000,000 of low interest rate funds to these credit societies, against which the Government guarantees ¥30,000,000. The term of redemption was 15 years.

A large rice crop means a great crisis for Japanese farmers occupying more than 45 per cent. of the total population of Japan. They can hardly cover their production cost of rice by cheap price following a large crop. A considerable farm deprivation followed and purchasing price sank heavily. The situation threatened to affect industries, whose prosperity depends very much upon the purchasing power of farmers. The Government and political parties racked their brains how to find out proper counter measures. The Rice Control Law, which the Government believed as the best, went into force on November 1, 1933. The law provides for fixing the high and low rice prices for every year by an Imperial ordinance. Prices are based on productive cost and living expenses. In order to maintain these prices the Government buys rice at the lowest price and sells it when the market price reaches the highest official price. According to the law, the Government is in a position to accept applications for sales of rice indiscriminately from farmers, but in the first year it does not buy rice other than that produced in 1933. The Government also will not buy rice failed to be duly qualified by testing. The 1933-34 high rice price was fixed at ¥30.50 and the

Digitized by Google

lowest at ¥23.30 per koku. Korean and Formosan rice is left out of the control law. Taking advantage of this, colonial rice found its way heavily into the Japanese market. Japan who encouraged an increased production of colonial rice for many years to make good short supply of home rice does not want it any more, because of a surplus supply in recent years. The cultivation of paddy fields in Japan leaves no more room for further development, while the increased production is still going on in Korea and Formosa, as follows :

(In koku)

	Japanese Rice crop	Korean Rice crop	Formosan Rice crop
1927	62,102,541	15,300,707	6,686,563
1928	60,303,089	17,298,887	6,841,070
1929	59,557,694	13,511,725	6,450,641
1930	66,882,008	18,701,746	7,110,852
1931	55,215,263	15,872,999	7,516,324
1932	60,390,098	16,345,825	8,072,848
1933	70,829,000	18,192,000	8,361,800
1934	51,839,629	16,717,000	9,088,800

Rice Question in 1934 The rice year 1934 (which means 12 months ending October 31, 1934) was one of misfortune. On September 1, 1933 (which was two months before the close of the rice year 1933), the total rice stock in the country was estimated at 17,126,000 koku, an increase of 1,979,000 koku as compared with the previous year's figure of the corresponding date. The first rice crop forecast, which was published on September 20, 1933, placed the figure at 65,680,000 koku, which gave an ample indication of rice flood that would take place as the between-season approached. Uneasiness was soon visible in rice markets and pessimism prevailed due to prospective decline in the price of rice. Holders of large quantities of rice began to clamour for Governmental purchases of the commodity. Local agricultural associations held a national convention and passed a resolution urging the Government to take a quick step for the remedy of the situation. The Government lent a willing ear to the demand, and adopted measures immediately. The first was the disbursement of the rice relief fund, amounting to ¥30,000,000, in September instead of in December as usual and the second was purchases by the Government of early rice crop to the extent of 350,000 koku. But these proved to be a mere patch-work. Fundamentarily the supply of rice was greater than the demand for.

In the meantime, the approach of the promulgation of the Rice Control Law had shown effects. A further collapse of the market had been held in check. But the weak tone still tenaciously held and it gradually became known that the Rice Control Law was insufficient for the solution of the rice question. Some other measures had to be taken. In response to the demand, the Government drew up two trial measures : (1) a reduction in the production of rice and (2) the encouragement of storing of rice. Around the first item of the programme, however, hot discussions ensued. Opposition was expressed even among the Cabinet members, not to mention the Seiyukai, with the result that it was postponed indefinitely. The other item, viz., the encouragement of storing of rice was put into effect on and from December 1, 1933.

Rice Control Law Such was the situation at the beginning of the 1934 rice year. The Rice Control Law was put in operation as from November 1 of 1933, with the minimum standard price at ¥22.70 per koku and the maximum price at ¥30.50, pending the final decision of the Rice Control Commission, which announced the price rates on December 16 at ¥30.50-¥23.30.

Digitized by Google

Immediately after the law was put into effect, the market quotations were somewhat above the minimum price fixed by the commission, owing principally to the expectation for a rise. But soon this proved unreal. The prospective increase of the crop in the second forecast, a large stock of surplus rice and the steady approach of the marketing period of new rice crop, all these combined to produce a drop in the price after the middle of December, which finally shrank below the minimum price. Application for sales of the commodity came thick to the Government. At the end of December the quantity offered for sale to the Government amounted to 2,370,000 koku (5,920 bales) and to 6,000,000 koku on January 4, 1934. Meantime, the harvest of 1933 was made known, it being 70,847,000 koku, which was 10,450,000 koku more than in the previous year. This meant that the rice supply in 1934 would leave a surplus of 18,300,000 koku over and above the demand. Under such circumstances it was no wonder that the market continued weak and sales to the Government received a further impetus. Thus the aggregate quantity of rice purchased by the Government reached 8,757,000 koku at the end of February.

Taiwan and Chosen Rice To make the situation worse rice from Taiwan and Chosen began to flood the rice market of the country, with the ensuing low price and dull market. Naturally the farmers began to clamour for immediate steps to be taken to remove the additional cause of their distress. The politicians joined their voice with the farmers and decided that unless the influx from the overseas territories be restricted within a certain limit, the Rice Control Law would lose most of its meaning. The 65th Session of the Diet witnessed fierce arguments for and against this proposal. Viscount Saito, then Premier, expressed his determination to introduce suitable bills in a week or so for the solution of this question and the result was that three bills were introduced and passed the Diet. The laws so enacted were, (1) the law for the temporary adjustment of the importation of rice, (2) the law for the creation of special account for the adjustment of supply and demand of rice and (3) the law for special disposition of Government owned rice, and all these three went into force as from May 20, 1934. The manner in which these three laws operated was as follows: (1) The Government would purchase rice from Taiwan and Chosen so as to check its effect on the price of home rice. The law, however, would cease to be operative on and from March 31, 1935. (2) The outlays necessary for the purchase of rice imported from Taiwan and Chosen would be met by disbursements from the special account created for the purpose. The limit of borrowings to be made by the special account was ¥850,000,000. A further borrowing of ¥300,000,000 by means of an Imperial Ordinance was made available in case of necessity. (3) The Government's holdings of rice were made disposable experimentarily in order to find out its new use, provided that the selling were not lower than those ruling in the markets.

In the meantime, there was organized in Chosen a league named "Chosen Rice Protection League", which adopted slogans, "Abolish discrimination against Chosen rice", "Rice is the death-or-life problem of 20,000,000 Koreans", etc. The next thing for them to do was to make representations at the Government-General and send up their representatives to Tokyo to gain a hearing to

Digitized by Google

their situation. In Taiwan too similar agitations took place. A whole Taiwan mass meeting was held to make their fight a victorious one. In Japan the Imperial Agricultural Association was firm in their stand. On March 6 an urgent national agriculturists convention was held under the auspices of that Association and passed a resolution and declaration to arouse public opinion for the interest of home rice producers.

Meanwhile the Rice Control Law evidently began to demonstrate its power. The quotation of medium grade rice at Fukagawa, Tokyo, was firm at ¥23.04 in February, ¥22.99 in March and ¥23.70 in April, the last-mentioned being above the maximum price fixed by the Law. At the same time the rice purchased by the Government by the end of March aggregated to 9,724,000 koku ; the rice withdrawn from public consumption as a result of storing reached 5,210,000 koku ; and the purchases of Chosen rice by the Government totalled 420,000 koku. All these combined took away from the market a larger portion of the rice which otherwise would have accumulated and the result was to make the price firm, as reflected by the May quotation of more than ¥24.56 and a fall in the amount of governmental purchases to 18,700 koku in the same month.

An Abortive Attempt In order to meet with the pressing situation the need of finding out a more thoroughgoing method was inevitable. The need was made more pressing due to the damages to the Kansai districts done by the typhoon and flood of September 21, 1934. The outcome was the appointment by Premier Admiral Okada of the Rice Question Investigation Commission in September, 1934, which, after painstaking investigations, recommended the Government in January, 1935, to amend the Rice Control Law so as to help building storehouses and to enact a law for the monopoly of rice. The Government in accordance with the recommendation drafted bills and presented them before the House of Representatives on February 26, but owing to want of time they all failed to be voted on. The central idea of the monopoly was that the Government, assisted by the efficient cooperation of farmers, should control more effectively than now the marketing of rice. In this the main question was how to control the excessive supply of rice. In order to provide for this, the bill proposed to establish a special commission, whose function was at the beginning of each rice year to calculate the total supply of rice (including that of Chosen and Taiwan,) for the coming year, giving due consideration to the stock, the prospective quantity to be consummed within the year and the proper quantity to be left over to the next year and thus decide the quantity to be designated as "surplus", if any. This surplus was later to be apportioned among Japan proper, Taiwan and Chosen at the rate of 35%, 22% and 43% and stored there.

Other Farm Production

Leguminous Plants Area of leguminous plants in 1933 was 633,191.41 ha., with decrease of 11,728.66 ha. (1.8%) and the production was valued at ¥73,275,676 which is higher than that of the previous year. During the past decade area has been pursuing a slow, downward movement, while a sharp reduction experienced by production was more than made good by the increase of 1933. Soy-beans and azuki (red) beans are predominant both in area and production.

Soy-beans	326,673.03 ha.	5,064,557 hl.	¥ 34,583,742
Azuki beans	114,036.00 „	1,710,722 „	13,554,644

Tuber and Root Crops Area cultivated with tuber and root crops in 1933 was 601,998.84 ha. and the value realised from their production was ¥182,903,453, the former advancing by 22,639.13 ha. (3.9%), while the latter increased by ¥14,338,971 (8.5%) than those of the previous year. The review of the past decade points to yearly lowering both in area and production. From the standpoint of area and production, sweet potatoes, radishes, satoimo and potatoes are predominant.

Digitized by Google

Sweet potatoes	269,393.95 ha.	35,117.238 100 kg.	¥ 70,458,656
Radishes	101,463.37 „	23,282.804 „	33,368,982
Satoimo (taro)	52,715.50 „	6,189.324 „	23,082,779
Potatoes	128,164.26 „	13,744.545 „	29,476,494

Industrial Crops Area cultivated with industrial crops in 1933 amounted to 239,658.54 ha. and the production was valued at ¥92,301,088, the former being 7,145.35 ha. (3.1%) above, the latter ¥18,195,811 (24.6%) higher, both as compared with the corresponding figures of the previous year. The tendency of the past ten years till 1933 has been a gradual falling-off on the part of area and a sharp decline in the value of production.

Chief products are summarized below :

Tobacco	66,540,142 kg.	¥ 39,158,028
Sugar cane	1,082,964,466 „	8,185,541
Rapeseed	1,321,984 hl.	11,630,612

Vegetables Area under vegetables in 1933 was 194,476.17 ha. and the value amounting to ¥94,749,739 was estimated for the production. Increase of 7,422.55 ha. (4.0%) and ¥12,451,965 (15.1%) were witnessed in comparison with those of the previous year.

Chief products are given below :

Water-melons	520,987,879 kg.	¥ 18,058,249
Tsukena	672,754,613 „	14,733,478
Egg-plants	468,230,636 „	13,875,733
Cucumbers	278,752,924 „	9,680,867
Negi (onion)	242,201,190 „	9,358,657

Fruits The production of fruits in 1933 was valued at ¥74,281,717, having increased by 16% to ¥10,047,338 as against the figure of the previous year. In the first half of the ten preceding years the production has been gradually improving but after the record production of 1928 the tendency was reversed, tending to a sharp decline.

Predominant are the following :

Mandarins	341,144,618 kg.	¥ 21,533,415 (29%)
Persimmons	236,303,156 „	11,599,941 (16%)
Pears of native origin	167,189,340 „	10,477,820 (14%)

Tea Tea manufactured in 1933 was 43,487,161 kg. in quantity and ¥21,209,279 in value, the former increasing by 3,077,063 kg. (7.6%) and the latter by ¥2,703,267 (14.6%) as against the figures of the previous year. Review of the past decade indicates an unbroken rise in production as a whole, while fluctuations in values of production have been brought about by falling-off of prices.

Livestock and Poultry (1) Horses Horses at the end of 1933 numbered 1,501,177, consisting of 852,834 of female and 648,343 of male. Foalings and horses perished were 110,326 and 22,443 respectively. The movement of number during the past decade has been very slow, often tending towards decline.

(2) Cattle Cattle at the end of 1933 numbered 1,559,838 (female, 1,157,936 ; male, 401,902), being 30,529 (0.2%) above the corresponding figure of the previous year. Calvings and cattle perished numbered 238,177 and 13,954 respectively. The tendency of the past ten years was a steadily increasing one.

(3) Swine Number of swine at the end of 1933 totalled 913,502, showing decrease of 12,508 (1.4%) over against that of the previous year. The movement during the year resulted in litters amounting to 659,565 and swine perished of

Digitized by Google

79,502. The raising of swine has been showing a sharp advance during the past decade, the number at the beginning of the decade being nearly doubled by the close of the same period.

(4) Sheep and Goats Sheep and goats at the end of 1933 numbered 30,516 and 236,021 respectively, both increasing as compared with those of the previous year, and the tendency during these past ten years has been towards increase.

Generally speaking, raising of sheep and goats cannot be said yet to be prevalent in spite of this marked progress.

(5) Fowls The total number of fowls at the end of June, 1933 was 50,910,994 (valued at ¥31,012,766), showing decrease of 3,395,125 (6.3%) as compared with the figure of the previous year. During the past ten years the number has increased nearly by 100 per cent.

Livestock Production (1) Milk The quantity of milk obtained in 1933 amounted to 2,135,414 hl. valued at ¥25,879,821, increasing by 189,522 hl. (9.7%) as compared with that obtained in the previous year. The number of cows milked during the same year was 86,948 at the year end.

(2) Meat and Animals Slaughtered The number of animals slaughtered and the quantity of meat obtained in 1933 were as follows:

Number of Animals Slaughtered

Total	1,468,360
Horses	92,447
Cattle	326,227
Calves	30,349
Swine	983,241
Sheep and goats	36,096

Quantity of Meat Obtained

Total	116,488,613 kg.	¥75,446,495
Horses	11,966,843 ,,	4,960,534
Cattle	50,501,699 ,,	44,251,591
Calves	1,443,555 ,,	871,874
Swine	42,232,465 ,,	25,197,688
Sheep and goats	344,051 ,,	164,808

As compared with those of the previous year number of animals slaughtered and quantity of meat obtained show the increase of 10,713 (0.7%) and the decrease of 2,127,045 kg. (1.8%) while the value increased by ¥7,867,377 (11.6%).

(3) Dairy and Meat Products Dairy production in 1933 amounted to 22,493,535 kg. valued at ¥16,531,722, both increasing (30% in the former and 3.8% in the latter) as compared with the corresponding figures of the previous year. Meat products in 1933 totalled 2,480,231 kg. valued at ¥2,205,328, both showing increase of 252,993 kg. (11.4%) and ¥675,510 (44.2%) as against those of the previous year.

(4) Eggs Number of eggs obtained during the year ending June 1933 was as follows:

	Number (in 1,000)	Value
Fowl's	3,408,888	¥70,591,038
Duck's	12,227	304,433

Both kinds of eggs advanced in value as compared with those of the previous year.

During the past decade the production of eggs has shown a substantial increase especially as regards fowl eggs whose production in 1931 more than doubled the figure of 1922.

Farm Village Life in Japan

The distressed condition of farm villages in Japan is well reflected in the yearly growing cost of living which outstrip the growth of their gross incomes. The whole situation is given in the following figures:

Digitized by Google

GROSS YEARLY INCOME AND COST OF LIVING IN FARM VILLAGES

Health and sanitation	26.10	5.55	31.26	5.69
Marriage and funeral	28.49	6.06	35.49	6.47
Various burdens	6.33	1.35	10.50	1.91
Others	30.29	6.43	34.89	6.36
Total	470.20	100.00	549.05	100.00

As shown in the above, in all the three classes of farm-households, landed, semi-landed and tenant farming, what constitute the largest portion in the cost of living is for food stuff. They spend for it 42.39% of their total household expenditure. A noteworthy thing is the gradual increase in the amount spent for that purpose from the landed farmers down to the tenant farmers. Next to food stuff they spend more than anything else for entertainment, clothing and marriage and funeral purposes, 8.54%, 7.83% and 6.47% being the order of the amount spent for these three items. Following them are the expenses for fuel and light of 6.05% and health and sanitation of 5.69%. In 1931 the farmers used their crops for payment of their household expenses to the extent of 40.88%, tenant farmers making payment for their purchases by this means up to 43.12%, semi-landed farmers up to 40.89% and landed farmers up to 39.22%.

CHAPTER XIV

SERICULTURE AND RAW SILK

Sericulture

History

Historical records show that the raising of silkworms was practised in Japan more than two thousand years ago. It is surmised that the industry was first introduced into the country from Chosen or China, but for sometime it made but slow development, as the work was almost exclusively in the hands of the naturalized Koreans and Chinese. Following the introduction of Buddhism, and with the advance of civilization, the demand for silk gradually increased and the industry spread among Japanese farm households. After that, sericulture made steady growth until about 1,100 years ago, when, at the time of the Emperor Kammu, it made a sudden spurt and spread over half the Japan proper of those days, and in less than another century most of the remaining half of the country was engaged in silk production. Recent development made in the industry is outlined in the following table, showing the cocoon output for the past half a century.

	(in 1,000 kwan)	Index number
1880–1884	12,223	100
1885–1889	11,147	91
1890–1894	15,436	123
1895–1899	24,608	201
1900–1904	26,484	217
1905–1909	32,622	267
1910–1914	43,184	353
1915–1919	61,561	504
1920–1924	64,877	530
1925–1929	91,668	749
1930	106,469	871
1931	94,072	709
1932	89,550	732
1933	101,247	828
1934	87,199	713

The recent condition in the sericultural industry can roughly be explained as follows : (1933, as compared with 1931 and 1932)

	1931	1932	1933
Number of agrarian families	5,623,800	5,642,509	5,621,536
Number of silkworm raising families	2,119,817	2,064,639	2,092,187
Percentage of silkworm raising families	37.6	36.7	37.2
Mulberry plantation area	chobu 682,774	chobu 652,514	chobu 640,178
Number of egg-cards brushed	gramme 170,006,525	gramme 166,811,582	gramme 181,200,931
Quantity of cocoon yield	(1,000 kwan) 97,072	(1,000 kwan) 89,550	(1,000 kwan) 101,163,566
Value of cocoon yield	(1,000 yen) 275,557	(1,000 yen) 296,791	(1,000 yen) 500,129

The Silkworm-raising Industry

Its Position in Agriculture According to the statistics taken by the Ministry of Agriculture and Forestry in 1933 the silkworm-raising families in Japan numbered 2,092,187 which is 37.2 per cent. of the entire agrarian families of 5,621,536 ; the mulberry plantation area was 640,178 chobu

Digitized by Google

occupying 10.6 per cent. of the total cultivated area of 6,028,764.4 chobu, or 22.8 per cent. of the aggregate area under cultivation except paddy fields. On average, each cocoon-raising family had mulberry plantations of 3.01 tan.

Next to rice, cocoons are the most important agricultural product in Japan. The yearly output of cocoons for the five years 1928-1932 varies from 93,849,000 kwan to 106,469,000 kwan, valued at from ¥275,557,000 to ¥655,000,000, and amounting to from 15 to 20 per cent. of the total value of agricultural produce.

The table below shows the importance of different principal agricultural products. Cocoons, it will be noticed, occupy the second place till 1933.

POSITION OF COCOONS IN PRINCIPAL AGRICULTURAL PRODUCTS

(Unit: ¥ 1,000)

	1929	1930	1931
Rice	1,584,729	1,117,951	913,181
Cocoon	655,000	304,212	275,580
Wheat and its kinds	271,099	203,258	155,571
Agricultural produce as food	198,951	141,096	127,641
Vegetables and flowers	255,472	139,489	170,000
Fruits	81,798	51,533	62,000
Artcraft agricultural product	109,961	83,131	75,500
Tea	30,472	24,198	18,871

	1932	1933	1934
Rice	1,235,024	1,433,590	1,384,622
Cocoon	296,791	500,129	203,849
Wheat and its kinds	158,141	221,819	256,595
Agricultural produce as food	158,1457	265,190	—
Vegetables and flowers	83,723	96,075	—
Fruits	064,244	74,291	—
Artcraft agricultural product	265,199	92,301	—
Tea	74,105	21,209	—

Egg-Cards

Control of Egg-cards Production In view of the severe competition with rayon silk in recent years there is a sheer necessity of improvement in silk industry so as to produce silk of a more superior quality with a lower cost of production, and the question of a better egg-cards comes first of all. There was no control of the preparation of egg-cards hitherto all the matter being altogether left to the hands of merchants and it is said that there are over 600 kinds of egg-cards to-day distributed among the farmers who are rather confounded in the choice of the best kind. For long the request for an effective control on the egg-cards production by the authorities has been raised among the farmers and silk producers. Consequently, the National Original Silkworm Egg-card Control Law was promulgated in 1934. The purpose of the Law is to realize a thorough control of egg-card production by 1938 and cut down the excessive number of different kinds and squeeze out the best ten by a special committee which is to be organized by the Imperial ordinance. The original egg-cards of the best kinds thus selected and sanctioned

Digitized by Google

by the Ministry of Agriculture and Forestry shall be sent to local governments where they are multiplied and distributed among sericulturists. Private establishments may reproduce egg-cards out of the original ones, but the percentage is limited to 30% against the 70% of local governments' production. The price shall be fixed by the Imperial ordinance. The local governments are granted a delay of 10 years for the completion of facilities, but, as a matter of fact the control will be completed without delay because most of local governments can immediately respond while the vacancy left by backward prefectures will be filled up by private concerns for the time being. Encouragement shall be given to an invention of better egg-cards by individuals so as to prevent the abuse of a too-strict governmental control. An annual profit of at least ¥100,000,000 is estimated at as the result of the control.

EGG-CARDS AND COCOON PRODUCTION

	Egg-cards (1,000 cards)			Cocoon Production (1,000 kwan)				
Year	Spring	Summer-autumn	Totals	Spring	Summer-autumn	Totals	Crop value (¥1,000)	Value per Kwan
1923	7,843	9,177	17,020	39,936	29,603	69,539	660,403	¥9.50
1924	7,550	9,311	16,861	39,477	34,340	73,818	551,680	7.47
1925	7,610	10,120	17,730	42,927	41,872	84,799	824,256	9.72
1926	7,612	10,349	17,961	44,155	42,569	86,725	661,454	7.63
1927	7,470	10,959	18,429	46,228	44,633	90,862	496,933	5.47
1928	7,925	10,964	18,890	49,562	44,287	93,849	551,679	5.88
1929	8,097	11,072	19,169	50,595	51,498	102,093	655,001	6.42
1930	8,466	9,886	18,353	56,103	50,360	106,463	304,213	2.99
1931	8,483	9,533	18,015	52,667	44,405	97,072	275,580	2.84
1932	8,726	9,473	19,205	46,391	43,159	89,549	299,777	3.31
1933	81,198	100,002	181,200	50,019	51,144	101,163	500,129	4.94

Note: Each egg-card counted at a weight of 9.375 grammes.

Mulberry Plantations

The success of the silk-worm raising industry depends upon an adequate supply of suitable leaves on which to feed the worms.

In Japan there are as many as 276 varieties of mulberry trees, and from these, 71 are selected by local government authorities as model kinds, each having its own special characteristics.

The total mulberry plantation area in 1933, was 640,178 chobu against 652,514 chobu for 1932; and 682,902 chobu for 1932; the total area covered with mulberries in 1933 being 10.6% of the total arable land and 22.8% of the total upland farms in the country. The number of mulberry saplings that were raised in the same year counted 227,798,871 pieces.

Cost

According to the investigation made by the Imperial Farmers' Association, cost of production against the price of cocoons in 1933 was as follows:

Digitized by Google

COST OF COCOON PRODUCTION

(For 1 kwan Cocoon; in yen)

Details	Spring Crop	Summer-Autumn
Egg-card	0.20	0.27
Mulberry leaves	1.82	1.73
Labour	1.46	1.84
Animal power	0.00	0.00
Cocoonery room	0.09	0 13
Instruments	0.15	0.22
Duties	0.09	0.13
Miscellaneous	0.30	0.26
Total	4.25	4.61
Price of 1 kwan best Cocoon	6.25	4.27
Income from by-products of the same	0.56	0.56

Educational Facilities There are in Japan three special colleges for the silk industry, namely, the Ueda Sanshi Semmon Gakko, Nagano prefecture; Tokyo Koto Sanshi Gakko, Tokyo; and Kyoto Koto Sanshi Gakko, Kyoto; besides which, there are, in different parts of the country, 16 public schools of middle school grade. Some of the agricultural colleges and middle grade schools also have classes dealing with silk industrial enterprises. In addition to these regular seats of learning there is a class for the practical training of silk-raisers at every sericultural experimental station established by the Government in each silk producing district, and a similar training is also given at a score of private institutes created for the purpose of diffusing knowledge on all phases of the silk industry.

Cocoon Markets Matsuzaki, on the western coast of Izu Peninsula, Shizuoka prefecture, was for many years the place where Japan's first market of the season for cocoon transactions took place and, naturally, cocoon prices quoted there were watched with keen interest by sericulturists and reelers, but because of a geographical disadvantage and other reasons, Matsuzaki has, since 1928, been superseded by Numazu. Usually, the first spring cocoon dealings begin in Numazu between May 20 and 25, according to the condition of the cocoon crop. Hamamatsu opens its market shortly after Numazu, but usually the spring cocoon market at Ohito follows the Numazu market and then dealings begin at Nirayama, Gotemba, Susono, Mishima and Omiyaguchi, all in Shizuoka prefecture. After, the market opens in turn at various parts of Mié prefecture, Chugoku, Shikoku and Kyushu, then in the Kwanto, Koshu, Shinshu and Tohoku districts. The reasons why spring cocoon transactions take place on the western side of the Izu Peninsula first are that the locality is climatically suited to a favourable growth of mulberry trees and there is a narrow difference of temperature only between day and night.

The Statistics Sericultural statistics in Japan for 1933 are summarized as follows:

Number of sericultural houses	2,092,187
Egg-cards (grammes):	181,200,931
for spring cocoons	81,198,451
for summer-autumn cocoons	100,002,480
Production of cocoons (kwan)	101,163,566
Value of cocoons	¥500,129,171
Spring cocoon output (kwan)	50,019,027
Value of spring cocoon output	¥298,404,044
Summer-autumn cocoon output (kwan)	51,144,539
Value of summer-autumn cocoons	¥201,725,127

Compared with 1932, the number of sericultural houses increased by 27,547, or 6 per cent.; cards gained by 14,389,349 grammes and the production value of cocoons increased from ¥296,791,026 to ¥500,129,171, this was due chiefly to the enhanced price level which was maintained throughout the year, although a considerable drop was experienced by the raw silk price during the latter half of 1933

Digitized by Google

Sericulture in 1934

Producers of silkworm cocoons engaged in 1934 numbered 1,995,492, consisting of those engaged in spring cocoon production numbering 1,866,552 and those engaged in summer and autumn cocoon production 1,810,787 inclusive of those engaged in spring cocoon production subsidiarily.

Quantity and value of cocoons produced in the same year totalled 326,742,555 kg. and the value estimated for the same was ¥203,849,178, 181,464,244 kg. of spring cocoon valued at ¥117,340,378 and summer and autumn cocoon of 145,278,311 kg., valued at ¥86,508,800, make up the above figures. Decrease of 52,933,811 kg. (13.9%) and ¥296,279,993 (58.1%) were revealed by comparison with the corresponding figures of the previous year. During the past ten years cocoon production has shown a sharp upward trend, however, since 1931 a slump in raw silk price deterred the extension of the production activity.

COCOON PRODUCTION IN 1930-1934

		1930	1921	1932	1933	1934
Number of producers		2,216,072	2,119,908	2,064,639	2,092,187	1,995,492

N. B. * Those actually engaged for the year.

Price of Cocoon

Farmers who are engaged in cocoon raising are not well informed of the international trade conditions and often fall into a short sighted speculations on the basis of the preceding year market prices. There is no systematic plan for adjusting cocoon production to the need so as to regulate the price. The future of the cocoon and silk markets, therefore, is hard to tell and the industry remains unsettled as long as it depends on the change of market prices of cocoon and raw silk.

Opinions of silk producers are divided into two; one is to regulate the price of raw silk by the governmental control like that for the price of rice, while the other is to compete with rayon with such a large production as to shut it out. The practicability of the former is doubtful as the nature of silk as a commodity is radically different from that of rice. The second idea may, in the last analysis, profit silk producers and brokers, but there is a danger of exposing farmers to the brink of bankruptcy before the prospect brightens in any extent, for

Digitized by Google

rayon will not give way so easily with its machines and capital. Farmers have to make a subtler and scientific study of cocoon raising industry to make it a more stable side work and at the same time to control cocoon production by selection and restriction of silkworms according to the amount of the balance stock of cocoon and raw silk.

AVERAGE COCOON PRICE IN JAPAN PROPER PER KWAN

(In yen)

	Spring Cocoon	Summer-Autumn Cocoon	Average
1924	7.87	9.22	8.21
1925	11.25	10.07	10.68
1926	9.28	7.33	8.35
1927	7.18	4.77	6.03
1928	6.88	6.02	6.48
1929	7.57	6.53	7.06
1930	4.00	2.04	3.10
1931	3.08	2.96	3.03
1932	2.54	4.70	3.53
1933	6.25	4.27	5.28

Raw Silk

Soon after the country's entry into foreign trade, the Tokugawa Shogunate put a restraint on the exportation of silk on the ground of its scarcity and of its being a prized national production. Notwithstanding such a restrictive policy raw silk exports from Yokohama increased by leaps and bounds, as enormous profits could be made by the exporters.

With the Restoration came the encouragement of home industries, the first of which to arrest the attention of the Government authorities was the silk industry, and ever since special efforts have been made toward developing this national industry. Unfettered financial help was extended to filatures in 1915, 1920, and again in 1930, and the Government has established facilities for the promotion of all phases of silk activities, schools, silk conditioning houses and various experimental stations.

The silk reeling and sericultural industry is represented by Nagano prefecture. Suwa is located in the central part of the prefecture and Okaya (Hirano Village) in Suwa district is the most thriving and largest silk reeling centre. No other silk reeling district in the world can rival it, since Japan produces two-thirds of the world's entire silk production, and silk production in Nagano takes the foremost rank in Japan. Gumma prefecture is the next largest reeling centre with Fukushima, Aichi, Saitama, Gifu and Kyoto following.

Raw Silk Production in 1933

Number of establishment worked during 1933 was 54,397, decreasing by 6,064 (10%) as compared with that of the previous year. Division of this number according to the number of basins used were as follows.

Those using	less than 10 basins		51,221	(94.2 %)
,, ,,	10 - 50	,,	1,512	(2.8 %)
,, ,,	50 - 100	,,	826	(1.5 %)
,, ,,	100 - 300	,,	171	(1.2 %)
,, ,,	300 and more	,,	171	(0.3 %)

The tendency shown by the number of establishments during the ten preceding years has been towards a severe reduction occasioned by the significant decrease in the number of those using less than 10 basins, while those using more than 50 basins has shown rather an advancing trend. Quantity and value of raw silk produced in 1933 were 42,160,560 kg. and ¥497,740,808, the former indicating increase of 570,394 kg. (1.3%), the latter that of ¥43,282,970 (10%) against those of the previous year. During the preceding ten years uninterrupted progressive trend has been witnessed in the production.

Note: The figures for 1932 are revised according to the correction of the Bureau.

Japan's Place in World's Silk Industry

According to the investigation made by the Silk Bureau of the Agriculture and Forestry Ministry the total world production in 1933 was 57,001,000 kilogrammes of which Japan (Korea and Formosa included) produced 43,757,000 kg., 76% of the total. China with 8,876,000 kilogrammes produced the largest quantity next to Japan. Then came Italy with 3,400,000 kilogrammes. A noticeable feature is a greatly decreased production in all countries except Japan, where the output, though diminished slightly compared with the 1931 basis, is still on the increase. Compared with 1923, the gain made during the 10 years was 18,189,000 kilogrammes. Detailed figures of the statistics prepared at the Silk Bureau of the Agriculture and Forestry Ministry follow:

RAW SILK PRODUCTION IN THE WORLD

(In 1,000 kilogrammes)

Year	Total	Japan	India & Indo-China	China	Eastern Europe, Near East and Central Asia	Spain	Italy	France
1924	52,670	28,666	80	17,144	1,095	95	5,255	335
1925	57,138	31,485	90	19,678	1,145	100	4,380	260

Silk in Japan's Foreign Trade

While importance of raw silk in Japan's foreign trade is on the decline in recent years, it still occupies more than 20% of the total value of her exports, ¥390,901,000 being its exports for 1933 out of the total exports of ¥1,861,045,000 for the same year. This forms a sharp contrast to the situation in 1922 and 1923, during which period silk occupied about 40% of her total exports. In 1934 the declining tendency was further emphasized and it dropped to ¥286,793,000, of which the United States took ¥244,379,000. It should be remembered that this 1934 export value of silk represented only 13.2% of the export value of all commodities. An interseting thing to be noted is that, while the silk export to the United States is steadily on the decline, it is on the increase to France, Britain and other countries. In 1932 France took Japanese raw silk to the extent of ¥7,107,000. In 1933 it increased to ¥15,378,000 and in 1934 to ¥20,333,000. In Britain it increased from ¥9,257,000 in 1932 to ¥14,237,000 in 1934. To other foreign markets it increased from ¥5,852,000 in 1932 to ¥7,843,000 in 1934.

SILK AND TOTAL EXPORTS COMPARED

(Unit: ¥1,000)

	Value of all exports	Value of silk exports	Percentage of silk
1912	526,982	150,321	28.5
1913	632,460	188,917	29.9
1914	591,101	161,797	16.3
1915	708,307	152,031	21.5
1916	1,127,468	267,037	23.7
1917	1,603,005	355,155	22.2
1918	1,962,101	370,337	18.9
1919	2,098,872	623,619	29.7
1920	1,948,395	382,717	19.3
1921	1,252,528	417,124	33.3
1922	1,637,452	670,048	40.9
1923	1,447,751	556,169	39.1
1924	1,807,035	685,366	37.9
1925	2,305,590	879,657	28.2
1926	2,044,728	734,052	35.9
1927	1,992,317	742,266	37.3
1928	1,971,955	733,436	37.2
1929	2,148,619	784,150	36.5
1930	1,469,852	419,107	28.5
1931	1,146,981	355,394	31.0
1932	1,409,992	382,265	27.8
1933	1,861,045	390,901	21.0
1934	2,171,924	286,793	13.2

As regards the quantity, it is rather on the increase compared with 10 years or so ago. In 1923 the exports were figured at 263,280 piculs and for the following 3 years the quantity of the annual shipment never exceeded 450,000 piculs in contrast to 497,485 piculs for 1933. But this quantity for 1933 was smaller than that for any single year between 1928 and 1932. In 1934 it regained the former level, realizing a quantity next to none other than 1931 figure. Below are given the yearly quantity of silk exported for the 10 years ending 1933:

	Quantity of Silk Exported (picul)
1923	263,280
1924	372,564
1925	438,449
1926	442,978

Price of Raw Silk

In January, 1920, raw silk was quoted at ¥4,360 per bale of 16 kan, the highest price in the history of the country's silk business. At that time the volume of production was 360,000 bales, but during the next 10 years production increased to 730,000 bales, unfortunately prices did not fall in inverse ratio, had they done so Japanese producers would have been happy, for in June, 1932, they reached a low of less than one-tenth that of 1920, whereas output had only doubled. In 1933 it regained a little, but 1934 price has fallen to the lowest.

CHAPTER XV

FISHERIES

General

Japan Leads From her natural position, the fishing industry has naturally developed from of old until today and Japan occupies the first position in the world in the production of aquatic animals and plants amounting to ¥468,151,078, in 1933, as the following tables show. These products consist mainly of fishes, shell-fishes, and seaweeds, which are used as food. But in addition pearls and corals are produced, while some fishes are used as raw materials for fish oils or animal fertilizers.

Fishes and shell-fishes of which the Japanese are very fond are abundantly found in the coastal waters as well as in rivers, ponds, marshes, etc. For centuries the Japanese have been familiar with aquiculture, though crude in form, carp and gold fish were raised in ponds, while oysters and edible seaweeds were cultivated in the sea. Until recently fishing was mainly carried on in the coastal waters where herring, sardine, bonito, mackerel, tunny, shad, sea-bream, eel, flat-fish, etc. and shell-fishes such as awabi (sea-ear), oyster, asari (Tapes philippinarum), clams, etc. are found. More recently, pelagic fishing has developed with great rapidity, and not only are trawl fishing and whaling carried on with unusual vigour but new methods of fishing as the use of floating canneries, or crab-canning vessels, and the use of mother vessels for the collection of salmon and trout have been increasingly used. With the development of deep-sea fishing the canning of crab and salmon is being carried out on a large scale, the products being exported to different parts of the world. Today Japanese canned crab is dominating the American market, while canned salmon is finding a ready sale in Great Britain.

Administration and "Kumiai" The power of administration of fisheries is delegated to the prefectural governors who are authorized under the Fishery Law to give orders regarding the modes of catching, transportation and sales of manufactured products, fishing implements, vessels, etc. In order to secure a more effective control of the industry and promote its development by the cooperation of aquatic products associations, or "Suisankai", legislation was enacted in 1921. "Suisankai" are associations organized by the people engaged in fishing, manufacturing, selling, or storing aquatic products and have as their purpose the improvement of the fishing industry. The Imperial Government subsidizes these associations to some extent. In addition to "Suisankai" there are numerous local fishing guilds covering practically all the important fishing villages, and also many "Suisan Kumiai" which represent some particular branch of fishery. All these organizations are established to promote mutual interest by providing means to develop and improve the fishery industry and to protect and propagate aquatic animals and plants. "Suisan Dogyo Kumiai" are organized under the Guild Law for Important Products, their functions being the standardization of aquatic products and the

Digitized by Google

improvement of their methods of trade, etc.

History of the Industry

Many historical records show that the people in Japan engaged in fishing and served fishes as delicacies at table from very early times. During the time the Ashikaga family ruled the country, fishermen in the western provinces were so bold as to sail not only to the Chinese coast but even as far as Annam and Siam. Fishermen during the time of Toyotomi were equally active and engaged in fishing in the seas round Korea. When, however, the Tokugawa Shogunate came to govern the country, it adopted the seclusion policy and dealt a severe blow to the fishing industry. Fishermen were prohibited from sailing to distant seas and pelagic fishery, which would otherwise have developed, gradually declined.

The international exhibitions held in Vienna and Philadelphia in 1872 and 1876, and the International Exhibitions of Aquatic Products held in Berlin and London in 1880 and 1883, had a great deal to do with the awakening of Japan's fishery industry. Somewhere about that time incubation was first introduced into Japan. In 1885, the Bureau of Aquatic Products was established in the Department of Agriculture and Commerce and at the same time Regulations for Fishermen's Associations were issued; investigations regarding aquatic products were started; indiscriminate catching of fishes, shellfishes, and seaweeds were prohibited; and various other measures for the protection, cultivation and improvement of the industry were adopted. In 1897, an Act for the Encouragement of Pelagic Fishery was enacted, and from 1902 on the Fishery Act, which was revised in 1910, was enforced.

As regards international relations, the Act for Fishery Associations in Foreign Seas was enacted in 1902. Under this Act the present "Suisankai" in Russian waters was established in December of 1908. In 1907, the most important treaty on fishery, the Russo-Japanese Treaty was signed between the two countries. In 1924, a further treaty on fishery was concluded between Japan and Soviet Russia.

Another important treaty, important from the standpoint of international relations on fishery, was signed between Japan, Great Britain, the United States of America and Russia in 1911 with regard to the protection of the fur-seal. In 1924, a treaty was concluded in Paris with the purpose of establishing an International Storage Association.

Survey of Recent Years

The Value of Catches In 1933 the value of marine products including catches in the Russian waters amounted to ¥260,267,064. That of marine products along the costs of Japan amounted to ¥170,613,874, showing an increase of ¥24,828,199, from ¥145,735,675 for the year before. Of the catches in the coastwise fishery fishes totalled ¥36,158,167, shells ¥7,972,010, other marine live products ¥26,288,328 and sea weeds ¥8,201,824. In the deep sea fishery the bonito surpassed all the rest, its value reaching ¥11,661,810. Next was the tunny which amounted to ¥9,788,857. The third was the seabream which brought ¥5,449,488. Coral catching is also included in the deep sea ocean going fishery and its production for 1933 reached 628 kwan and ¥187,472. Catches in the Soviet waters were valued at ¥23,666,332 in 1933 against ¥31,909,072 in 1932. But the 1934 production increased to ¥42,234,068. The number of leased fishing grounds

Digitized by Google

for 1934 was 386 against 357 in 1933 and 392 in 1932. Productive value of canned marine products there for 1934 totalled ¥29,709,884 against ¥14,588,106 for 1933.

The activity of Japan Industry Company in fishery business during 1933 deserves noting. The concern placed under its control the Kyodo Fishery Company, Japan Godo Floating Cannery Company, Japan Fish Net and Implement Company and Toyo Can Manufacturing Company to rival the Nichiro Fishery Company, the largest fishery company in Japan. These companies of Japan Industry affiliation concentrated their energy on deepsea fishery, which had made a remarkable growth as the result. Fish catches in the deepsea fishery for 1933 by five fishery companies other than Nichiro Fishery realized satisfactory results, as is seen below:

Companies	Red Salmon	Salmon Pink
	(In cases)	
Hirade Okidori	20,364	unknown
Daido Okidori	17,995	16,950
Taiheiyo Fishery	50,086	29,725
Miyagi Fishery	10,000	4,255
Okidori Godo	32,710	24,605
Total	131,155	75,535
Nichiro Fishery	281,299	459,625
Grand total	412,454	435,160

Nichiro Fishery's business interest was very much affected by the activity of these five companies. Alive to the promising future of deepsea fishery, Kyodo Fishery has turned its attention to this field and applied to the Hokkaido Government for operation in the North Kuriles. This company placed under its management the Godo Fishery Company, which specializes in deepsea fishery. Thus the deepsea fishery for 1934 is to be competed between Nichiro Fishery and Kyodo Fishery. However, Taiheiyo Fishery is affiliated with Nichiro Fishery and does not take too much heed to the activity of Kyodo Fishery.

Kamchatka Fishery Auction Disputes pending between Japan and the Soviet Union on Kamchatka fishery grounds out of the yen-rouble conversion rate have not yet been solved. Prior to the annual fishery auction for 1934 to be held on February 20, 1934, the Soviet Union suddenly notified the Japanese side of the increase of conversion rate to 75 sen. The Japanese Government and fishery companies rejected to the proposal and the matter was left to diplomatic negotiations. When the date of auction neared, Japanese fishery companies deposited guarantee money at the rate of 32.5 sen with the Soviet Fishery Board in Vladivostok to participate in the auction. On reason that the guarantee money is a half the required amount, the Soviet side declared the auction for Japanese null and void. The conversion rate was agreed upon as the result of negotiations between Baron Kijuro Shidehara, Foreign Minister, and Mr. Alexander Trayanovsky, Soviet Ambassador in Tokyo, in May, 1931. The sudden proposal for changing the rate had a very delicate situation connected with it. The Soviet side announced the new auction to be held on March 5, but the Japanese side still insisted on the validity of the first auction. If the Japanese side ever participated in the new auction, this means it recognized the invalidity of the first auction and Soviet proposal for having doubly raised the conversion rate. Eventually, the Japanese side persisted in its due claim for the first auction and did not participate in the second auction, thus disclaiming their right to participate in the auction this year. The year's new grounds acquired by Japanese in the first auction were 34, which the Japanese side does not give much importance and this does not affect the

Digitized by Google

whole fishery situation in Kamchatka very badly against Japan. Japanese fishery companies forsook their right to participate in the second auction and sent their ships to Kamchatka during April. The Japan-Soviet Fishery Treaty was concluded on March 1, 1928, but, due to its defects, a provisional treaty was concluded between the two Governments in August, 1932. This treaty holds good till 1936. The treaty aims at reassurance of Japanese right and interest, the expansion of Soviet fishery interest and the solution of pending issues. According to the revised treaty, except for 60 grounds out of 392 grounds (371 for salmon, trout and herring grounds and 21 for crab) operated by Japanese all the remaining grounds can be secured as they are till 1936 without being subjected to auction. Japan recognizes the increased catch of the Soviet side by 37 per cent. or 5,000,000 poods till 1936.

Persons Engaged in Fisheries

The fishery industry in Japan is now run on a modern industrial basis and especially pelagic fishing, is developing rapidly. But by far the larger number of fishermen are still engaged in working in the old-fashioned way, generally on a small scale. In 1933, as many as 1,499,175 men and women were engaged in fishery, and of this number about 1,216,434 were males and 282,741 females. Classified as employers and employees, the former numbered 635,849, and the latter 863,326. Of the total number, 1,097,254 were fishermen, 144,655 were engaged in cultivation and 257,266 in the manufacture of aquatic products. Of all the prefectures Hokkaido accounted for the largest number, 186,000 persons. Next came Nagasaki with 80,000, Chiba 68,000, and Miyé and Shizuoka above 52,000 each following.

NUMBER OF PERSONS ENGAGED IN VARIOUS BRANCHES OF THE FISHERY INDUSTRY

Year	Total number	Fishermen	Those engaged in cultivation	Those engaged in manufactures
1928	1,498,258	1,130,430	119,986	247,842
1929	1,490,726	1,112,002	120,933	257,791

Fishing Boats and Vessels

The total number of boats and vessels engaged in fishing at the end of 1933 was over 363,473, of which 314,434 were without engines, while over 49,039 were with engines. Owing to the fact that the number of smaller boats, having capacity of less than 5 tons, decreased, the total number of vessels is showing a decreasing tendency. However, the number of vessels having engines has steadily increased. This shows an improvement in vessels and in the method of fishing.

Year	Total number of boats	Boats without engines	Boats with engines	
			Steam	Motor
1919	384,609	380,577	99	3,933
1927	354,554	333,757	91	20,706

Coastal Fishery

About 363,473 small fishing boats including about 49,039 small motor boats, with drag or stationary nets were engaged in coastal fishing in 1933. Fish, shell-fish, etc. caught by this method in 1933 amounted to ¥170,613,874 in value, the details of which were as follows :

	Quantity	Value
Fish	2,860,585,500 kg.	¥128,151,712
Shell-fish	135,593,126	7,972,010
Other aquatic products	204,347,385	26,288,328
Seaweeds	659,467,837	8,201,824

and principal items, the values of which reached over ¥5,000,000 each were as follows :

Herring	1,007,557,219 kg.	¥13,378,292
Sardine	1,314,770,636	26,035,079
Mackerel	69,642,949	5,746,877
Yellow-tail	36,923,089	10,934,744
Sea-bream, red	12,529,170 kg.	¥10,434,290
Cuttle-fish	114,733,308	11,781,091
Prawn and shrimp	23,727,446	6,179,560

Digitized by Google

Of the prefectures, Hokkaido made catches amounting to ¥39,356,953, Nagasaki and Yamaguchi over ¥7,000,000 each, and Kanagawa, Aichi, Miyé and Shizuoka over ¥5,000,000. The amount of catches in coastal fishery since 1921 is shown in the following table. It must be noted that while the value of catches shows a gradual decrease, catches themselves are steadily increasing, showing thereby that the decrease in value is due to decline in price caused by the depression of the last few years.

(Quantities in Metric Tons, Values in ¥1,000)

Year	Total		Fresh fishes

1 Laminaria. 2 Porphyra. 3 Undaria pinnatifida. 4 Gelidium corneum.
5 Gloiopeltis furcata.

Pelagic Fishery

Large-sized vessels with motors have increased greatly in number lately. There are over 10,000 vessels of over 10 tons, many of which are actively engaged in fishing at distances of up to 700 miles from Formosa and Japan proper. The northern seas have been opened up by floating crab canneries, and mother vessels for the salmon and salmon trout fisheries. But there are still vast undeveloped areas in the Behring Sea, the Sea of Okhotsk, the Maritime Province waters, the South Seas, the South China Sea, the Gulf of Siam, etc., so that the future for pelagic fishery for Japan is bright and of great importance to her. The following sections deal with different branches of deep-sea fishing.

In Home Waters In 1933, the number of vessels engaged was 8,225, the number of men 112,919 and the amount of catches 737,095,405 kg. of a value of ¥65,986,858. The vessels with engines numbered 7,943, while those without numbered only 282.

Catches of principal fishes are as follows :

Bonito	65,153,468 kg.	¥11,661,810
Tunny	41,683,286	9,788,857
Sea-bream	10,265,790	5,449,488
Flat-fish	50,449,706	5,287,694

In Northern Waters By northern waters is meant seas lying north of 42° North Latitude and includes the Behring Sea, Okhotsk Sea, and the northern portion of the Japan Sea. Its total area is roughly 3,367,000 sq. km., of which the Behring Sea covers 1,968,000 sq. km., Okhotsk Sea about 1,295,000 sq. km., and the northern portion of the Japan Sea about 207,000 sq. km. The kinds of fishes caught are salmon, trout, herring, and cod, etc. including crabs and whales. It is in these waters that trawler fishing, Norwegian whaling, crab canning on floating canneries, and salmon and trout fishing by the use of mother vessels are carried on.

Norwegian Whaling Whaling is being carried out according to the Norwegian method. As this method requires quick movements the vessels used are small sized ones of a capacity of below 120 tons. In order to allow whales to breed and also to maintain order in the work the Government has made it a rule that whaling can only be carried on under permit. The Government furthermore restricts the number of vessels engaging in this work to 30 in seas other than the Southern or Northern Pacific Ocean. It also orders vessels to operate from headquarters placed in 18 suitable places along the coast of Hokkaido, the North-Eastern Sea, South-Western Sea and the Japan Sea.

Trawling Trawling in Japan is modelled after that now being carried on in the North Sea. The steam vessels engaged are from 200-300 tons in size, some being fitted with Diesel engines. A permit must be obtained from the Government before commencing trawl fishing. At present the Government is restricting trawlers in the Inland Sea, the East China Sea, and the Yellow Sea to 70 vessels. 56 vessels make Shimonoséki their headquarters, while 8 work from Nagasaki, and 6 from Hakata. It also prohibits trawlers, by special regulations, from operating in the nearby seas in order to keep the coastal water free from the devastation caused by the destruction of immature fish, etc. During the World War there was a fall in the catches by trawlers owing to the decrease in number of trawlers, but since 1921, the trawling business has again become active though, as mentioned above, the number of trawlers is restricted to 70. Catches by trawling in 1933 amounted to 50,351,753 kg., value ¥6,254,456.

FISHES CAUGHT BY TRAWLING

(Quantity in metric ton, value in ¥1,000)

Fishery in Russian Waters

Fishery in Russian waters is an important right conceded to Japan in the Treaty of Portsmouth, signed at the conclusion of the Russo-Japanse War of 1904-05. In 1928, a new convention (Appendix), under the conditions of the above Treaty was concluded for a period of eight years, after the expiration of which time the pact is to be renewed. The districts to be worked, extending from the Maritime Provinces to Kamchatka, are leased from the Soviet at annual auctions held at Vladivostok.

In 1933 the number of fishing lots actually worked was 350, the number of steamers 174, sailing vessels 1, and number of fishermen and others engaged in the fishing 17,506. The amount of salmon, trout, and herrings caught in 1933, was 47,664,800 kg. in total, the catches of crab amounted to 2,546,331 pieces and

Digitized by Google

that, in 1934, 1,081,646 kg. and 3,583,413 respectively. Good catches of salmon and trout are made every other year, while the quantity of crabs has a tendency to become smaller. The amount of salmon, crab, etc. canned was 698,126 cases, valued at ¥14,588,106 in 1933. In the same year the amount of salmon and trout salted reached 31,241,800 kg. The following table shows the number of fishing districts leased, amount of fish caught, etc.

Floating Crab Canneries Fishing is carried on by vessels equipped with machinery for the purpose of canning the crabs on the vessels themselves. The first enterprise was made in 1921, and, in 1923, rules regulating the work of crab-manufactory vessels were issued by the Government, which also established districts where fishing was forbidden and made permits necessary before a vessel could set out to the fishery. Recently the rule has been revised, the number of vessels on the western sid of Kamchatka restricted to 18 and the amount of canned crab to 320,000 cases.

Up to 1927, Japanese only were engaged in this fishing, but in 1928 two Russian vessels came in, in 1929 another two entered and 1930 saw a further increase.

Canned crabs manufactured by this method since 1924 are as follows :

OPERATION OF CRAB MANUFACTORY VESSELS

No. of vessels, crabs caught, etc.	1928	1929	1930	1931	1932	1933

Coral Fishery

Coral fishery has declined so much that it is hardly worth mentioning. In 1926, the total collected amounted to 24,356 kg. valued at ¥1,038,700, but since then it has kept decreasing until in 1932 the production was as small as 604 kwan valued at ¥82,454, all of the amount for 1932 having been obtained in Nagasaki prefecture, though in 1933 the quantity was increased to 628 kwan and the value to ¥187,472.

Pearl Fishery

Pearls produced in Japan are of two kinds, namely, natural pearls and cultured pearls, the latter being manufactured according to the Mikimoto patented system. The principle of pearl culture in brief is to put a foreign substance in the oyster shell when it is 3 years old. The foreign body is incapsulated with layer upon layer of beautiful nacre and forms a pearl which is taken out at the end of four years. Formerly, objections were raised to

Digitized by Google

the pearls so produced, but it is now recognized that these cultured pearls are as good as real pearls in every respect, since exhaustive investigations by many noted scientists have proved that culture by the scientific stimulation of oysters and the natural formation are essentially the same. Mr. Mikimoto's culture grounds, located near Toba in Miyé prefecture, are the most important in the world. Miyé produced 68% of all the pearls produced in Japan for 1932. Other important pearl producing prefectures are Nagasaki and Wakayama. The production of pearls and pearl oysters in recent years is tabulated below.

(In 1,000 pcs. and in ¥1,000)

Year	Pearls		Pearl Oysters	
	Pcs.	Value	Pcs.	Value
1930	819	712	6,160	173
1931	1,079	564	10,289	117
1932	3,655	989	23,902	107
1933	2,492	909	18,932	286

Aquiculture

The conservation and cultivation of aquatic resources is very important to Japan as fish and other marine products constitute a great part of the staple diet of her people. Great care and study are being given to aquiculture in the country, the incubation and letting loose of salmon and trout and the cultivation of fishes in shallow waters are being well looked after by the Government. From 1926 on, not only the incubation of salmon and trout, but also the transfer of crawfish, shad, etc., was tried several times with assistance obtained from the U. S. A. In order to encourage the incubation of salmon and trout in public waters the Government issued in 1926, Rules for Encouraging Aquiculture, and decided to bear 70% of the expense required for the selection of spawn, etc., when the incubation work was undertaken by various prefectures, or by any fishery associations. From 1926 to 1929, the Government spent ¥793,560 for these purposes, and let loose 601,940,000 incubated fishes. In addition, aquiculture for both fresh and sea-water fishes is carried out on a business basis by private interests in various ways. Business of this kind is increasing, but there is still room for large development as the area over which aquiculture is being carried on is only 524,102,737 sq. m. in 1932, which is only about 6% of the total available area. The principal fishes, shell-fishes and seaweeds which are now being cultivated are carp, eel and tortoise in fresh water, and the seaweed laver in seawater. The breeding is done in rice-fields, breeding ponds, reservoirs, marshes, etc.

The number of aquicultural establishments in 1933 was 159,091, the area covered 537,908,403 sq. m. and the amount of products was valued at ¥19,283,371 increasing by 4.4% to ¥813,228 as compared with that of the previous year. Carps, ¥3,922,992 ; eels, ¥3,586,338 ; oysters, ¥1,193,086 ; amanori, ¥6,481,262 were important in this group. During these ten years, increasing importance has been attached to aquiculture as an important fishery activity. Condition and results of the industry in recent years are given in full in the following tables :

Manufacture of Fishery Products

The supply of fish depends to a considerable extent on seasonal changes but demand is controlled by the tastes and customs of consumers, so that supply and demand are too often not well balanced. In order to adjust these difficulties satisfactorily, careful studies have been made regarding the storing and preserving of these products. Es-

Digitized by Google

pecially, as the problem of food has become a serious one lately, it is often argued that a portion of the fishes which are now being turned into fertilizers and which amount to 40% of the total yields, should be converted into food. Under these conditions Japan is paying very careful consideration to the manufacture of fishery products.

The total manufactured fishery products in 1933 was valued at ¥176,598,115, of which ¥28,843,857 was in fertilizers, ¥6,947,198 in fish oils, ¥576,457 in Gloiopeltis dried, and the balance of ¥140,230,603 was the value of food products.

MANUFACTURED FISHERY PRODUCTS

(Units: Quantity metric ton, value ¥1,000)

Year	Total	Food products		Fertilizers

Note: Production of isinglass is not included in the table.
* Dried seaweed, Gloiopeltis furcata.

Fish as Food

To the present the Japanese people have not paid much attention to the manufacture of fishery products as articles of food, because fresh fish is available at almost any time and any place. But since there is a large consumption of such products among people of Western nations attention has been turned to the preservation of fish with a view to export. The principal items preserved are "fushi" (fishmeat steamed and dried), fishes dried, salted and dried, boiled and dried, smoked, salt-cured, canned, and isinglass. Production of each for the last few years is:

FOOD PRODUCTS

(Unit ¥1,000)

Digitized by Google

(a) The total amount of "fushi" produced in 1933 was 24,800,666 kg. valued at ¥15,628,135, of which "Katsuo fushi" (Bonito) accounted for 8,120,775 kg. valued at ¥10,500,143, sardines 8,500,136 kg. valued at ¥2,093,711. Tunny and mackerels are the next most important. "Fushi" is produced largely in Kagoshima and Shizuoka prefectures.

(b) Dried fishes and seaweeds consist of cuttle-fish, sharks' fins, herrings, herring roes, cod, "kombu" (Laminaria), "wakamé" (Undaria pinnatifida), etc. Of the total production of 98,396,895 kg. valued at ¥21,221,928, cuttle-fish accounted for 16,144,931 kg. value ¥8,313,203, and "kombu" 31,957,646 kg. value ¥2,990,351. Hokkaido is the largest producer.

(c) Sardines, horse-mackerel, mackerel, cod, etc., are the chief among the salted and dried fishes. The total production was 56,021,239 kg. valued at ¥8,300,189; sardines 32,639,498 kg. value ¥3,498,722; cod 9,213,630 kg. value ¥1,679,909 were the two largest products.

(d) Boiled and dried fishes and shellfisehs produced in 1933 amounted to 66,580,200 kg. value ¥16,794,512. To this class belong sardines, sand eels, abalone, prawns and shrimp. The amount of boiled and dried sardines produced was 51,964,789 kg. in weight and ¥9,805,281 in value.

(e) Among smoked fishes herrings take first place. Total production in 1933 amounted to 1,149,506 kg. valued at ¥360,577.

(f) Salt cured fishes are mostly sardines, mackerel, dog-salmon, trout, whales, etc. Total products of these fishes amounted to 61,842,161 kg. value ¥9,773,231, of which the dog-salmon amounted to 7,095,379 kg. valued at ¥2,499,339, and trout 7,461,060 kg. valued at ¥1,286,985.

(g) In miscellaneous manufactured fish products the total amount of which reached 103,270,605 kg., and ¥47,848,025, fish-paste amounted to 74,789,940 kg. valued at ¥27,500,250, "hoshinori" (laver dried), amounted to 2,256,934 kg. ¥10,149,221, and "Mirinboshi" (fishes flavoured with sweet saké) amounted to 9,008,933 kg. valued at ¥2,781,858.

(h) Canned fishes amounted in 1933 to 38,206,297 kg. valued at ¥20,304,006. Salmon-trout, crab, sardines, "awabi", and "sazaé (wreath-shell) come into this class. Of these, canned salmon-trout, the production of which was 11,614,976 kg. valued at ¥4,828,354, was the largest.

(i) The production of isinglass is shown in the following table:

	1930	1931	1932	1933	1934
No. of establishments	405	411	431	435	429
Total production quantity kg.	51,482	1,387,620	1,529,310	1,573,230	2,081,404
Value yen	4,342,613	3,951,402	4,123,893	3,883,464	4,718,521

Total food products prepared in 1933 were ¥140,230,603 in value and were about 70% of the total of ¥176,598,115, value of all fish products prepared.

Fertilizers

Details of the production of fish fertilizers are given in the table below. As the table shows most fertilizers are made from herrings, sardines and bonito. Where transportation facilities are not very good or where there is no satisfactory equipment for manufacturing them into food fishes are converted into fertilizers.

1933	438,117	28,843	5,121	17,750	526	966	2,300	2,178

Fish Oils

Fish oils used for industrial purposes are sardine oil, herring oil, cod oil, whale oil and shark oil. Production is increasing every year, in 1933 it was 70,633,755 kg. against 57,089,096 kg. in 1932, the value being increased from ¥4,120,642 to ¥6,947,198.

STATISTICS OF FISH OILS

(Value in ¥1,000)

Year	Total	Sardine	Herring	Cod	Whale	Shark	Others
1927	3,697	1,842	634	183	427	256	403
1928	4,407	1,982	707	151	709	409	446
1929	5,180	2,913	448	155	666	422	574

1933	6,947	4,804	295	255	439	448	703

Sukifunori

(Dried Gloiopeltis furcata, used as a starch)

The production of sukifunori in 1932 amounted to 195,654 kwan, valued at ¥583,958.

Year	Quantity kwan	Value yen
1929	264,960	1,047,663
1930	196,515	641,722
1931	211,474	731,561
1932	195,654	583,958
1933	181,165	576,457

Manufacture of Salt

The salt industry in Japan is carried on under the Salt Monopoly Law. Salt is manufactured by the boiling method. The cost of production, therefore, is high, and the quantity produced is not enough, so that a large quantity of cheap salt is imported every year. The number of salt producing establishments, production, production areas, etc., in Japan are as follows :

Year	No. establishments Mar. 31	No. of manufactures Mar. 31	No. of employees Mar. 31	Area of salt-beds Mar. 31	No. of boiling pans Mar. 31	Production
1929	3,682	3,727	41,116	4,888.17	4,115	644,150,900 kg.
1930	3,449	3,398	37,783	4,531.24	3,906	628,682,100
1931	3,434	3,390	37,115	4,529.85	3,852	521,261,500
1932	3,393	3,395	36,156	4,533.72	3,816	5,726,285
1933	3,361	3,378	36,672	4,538.48	3,804	6,308,350

Protection and Encouragement of Fisheries

Pelagic Fishery Deep-sea fishing must be undertaken by strongly built sailing vessels or steamers, so in order to encourage the development of this fishing with adequate equipment and trained men the Government as far back as 1897 passed an Act for the Encouragement of Pelagic Fishery. The Act is still in force though it has been many times revised. Subsidies for the encouragement of pelagic fishery are of two kinds :—subsidies for fishery and subsidies for fishing vessels. The subsidies for fishery are granted to those who engage either in pelagic fishing with vessels which are in comformity with the rules for construction of vessels prescribed in the Regulations of Inspection of Vessels Engaged in Pelagic Fishery, or for those who carry on the business of transporting fishes caught in pelagic waters, with certain conditions according to kinds, place, period of time, market, or method of disposition of fishes, etc. The subsidies for fishing vessels are granted to those owners of vessels who either build vessels according to the rules of construction prescribed in the Regulations of Inspection of Vessels Engaged in Pelagic Waters, or who fix new engines, or subsidiary fishing implements, or who have installed in their vessels storage facilities, or wireless telegraphic or telephonic equipment, according to the following rates :

1.	For every ton of vessel newly constructed of steel	less than yen 60
2.	„ „ „ „ „ „ „	„ wood „ „ „ 45
3.	„ every H. P. of steam engine	„ „ „ 22
4.	„ „ „ „ motor engine	„ „ „ 40

The Act provides further that, for vessels over 60 tons, instead of applying the subsidies enumerated above, a subsidy not exceeding 20% of the total cost of construction shall be granted. When, furthermore, designs of construction of certain vessels, or repairs of vessels are considered good and proper, the Government shall grant a subsidy not exceeding 1/3 of the expenses required.

After the Act came into operation pelagic fishery made great progress and in 1928, the amount of fish caught amounted to over ¥100,000,000 in value. Though the total value has decreased during the last few years, due to the decline in price, the total quantity is steadily increasing. In 1932 the quantity reached 693,967,481 kg. the largest on record while the value amounted to ¥57,390,923. This progress may be partly due to the times, but the fact that the Act had a great deal to do with it can not be denied. The total value of fish caught in home waters was ¥30,520,000 in 1919, but this increased to ¥65,986,858 in 1933.

Harbour Construction Formerly fishermen used to draw their boats up to the beach where their homes were, but since deep-sea fishing with large vessels has increased it is no longer possible to do so. For mooring, for taking refuge, for discharging fishes caught, for loading fishing requisites, etc., it became very necessary to carry out harbour construction work at fishing ports which serve as headquarters and refuges of vessels. In 1908, therefore, the Government revised a part of the Act for the Encouragement of Pelagic Fishery, and provisions were made for making investigations on harbours. Accordingly 200 ports were carefully investigated. In the meantime, the construction of fishing

Digitized by Google

ports and ports of refuge was undertaken independently by various local prefectural governments, by towns or villages, or by fishery associations in increasing numbers. Later, it was found that harbour construction was necessary for other reasons, such as hygiene, or the supply of food, etc., and the Government decided to proceed with the work of harbour construction from 1918 on. Ports constructed by the Government since that year are 18 and the amount of subsidies granted reaches to ¥14,438,000. In 1931 the number of ports in Japan was 1,463, of which fishing ports numbered 536. The names of fishing ports constructed and the years in which instructions were issued by the Government are as follows :

The year in which instruction was issued	Port	Prefecture
1918	Onahama	Fukushima
,,	Shirahama,	Chiba
1918	Ito,	Shizuoka
,,	Nooi,	Niigata
,,	Yuzu,	Miyazaki
,,	Namikiri,	Miyé
1919	Yatsudo,	Aomori
1920	Taki,	Ishikawa
,,	Tomiyé,	Nagasaki
1921	Kushikino,	Kagoshima
,,	Misaki,	Kanagawa
1923	Choshi,	Chiba
,,	Ezumi,	Shimané
,,	Murotsu,	Kochi
,,	Himi,	Toyama
1929	Shinoseki,	Yamaguchi
,,	Hamada,	Shimané
1930	Uotsu,	Toyama

In addition to the above, the Government subsidized harbour construction in smaller ports, viz., Katsuura in Chiba prefecture, Manazuru in Kanagawa, Kisenuma in Miyagi, Toshi in Miyé, Kazumi in Hyogo, Mikuni in Fukui, Shimizu in Kochi and Namachi in Toyama.

Encouragement of Aquiculture This matter is dealt with in the foregoing pages.

Encouragement of Construction of Storage for Fishes In an effort to bring about an equilibrium between demand and supply and with the development of deep-sea fishing and the capturing of fish in places far distant from the place of consumption, the necessity of cold storage and the transportation of fishes by cold storage vessels has arisen. The Government issued Rules for the Encouragement of Cold Storage for Fishery Products in 1923, and since then has been granting subsidies for the construction of cold storage quarters, cold storage vessels and ice storage.

(1) Cold Storage Vessels Subsidies for construction of cold storage vessels are granted in the following manner :

(a) For construction and repair of vessels and engines, subsidies of less than 20% of the cost will be granted.

(b) For equipment, addition or reconstruction of cold storage, subsidies less than 50% of the required expenses will be granted. Since the Rules were put into effect, cold storage vessels have been built in rapid succession. Up to 1929, 18 vessels were constructed and subsidies amounting to ¥530,000 were granted.

(2) Cold Storage The amount of subsidy for construction, addition or reconstruction of Cold Storage is less than one-third of the cost. Prior to enforcement of the Rules for Encouragement of Cold Storage, refrigeration by air was introduced from U. S. A., and as the result of encouragement, cold storage businesses arose in every part of the country. Up to 1929, subsidies amounting to ¥2,467,000 had been granted to 99 persons out of the 174 who had applied for them.

(3) Ice Storage The amount of subsidy for construction, addition,

Digitized by Google

or reconstruction of ice storage is less than one-third of the cost. Owing to the rapid development of ice manufacturing since 1919, ice storage has developed in every part of the country, and ice storage plants for fish have been constructed in numerous places along the coast. The Government began to encourage their construction in fishing villages in 1923, and up to 1929 subsidies amounting to ¥180,000 were granted to 83 persons out of the 144 who applied for them.

System of Fishing Rights

Any system which makes the capture of fishes or shell fishes in the sea a right is unknown in the West. Japan, however, has had a system of this sort in a rude form from of old, and in 1901, the system was legally established by the Fishery Law, because of the necessity of protecting the cultivation of fishes and the maintenance of fishing villages. There is a similar kind of system for rivers, lakes and marshes, but examples of river and lake fishing rights are also found in foreign countries. The kinds of fishing rights which are given in the Fishery Law are as follows:

(1) Exclusive fishing rights.
(2) Fixed " "
(3) Divisional " "
(4) Special " "

Fishing rights are considered as rights of property. They can be transferred freely, if registered, and money can be borrowed with them as security. The term of fishing rights are fixed by the authorities which issue the licence within twenty years, but they may be renewed on application by the owners of the rights. The term of an exclusive fishing right is fixed at 20 years.

Facilities for Fisheries

In 1925, the Government issued Rules for Encouraging the Establishment of Facilities for Fisheries and ruled that it would grant subsidies for facilities established by Gyogyo-Kumiai, Suisankai, Suisan-Kumiai, industrial associations, or local municipalities of cities, towns and villages. The kinds of facilities encouraged are:

1. Facilities for quays and the mooring of vessels.
2. " " the sale of manufactured fishing products.
3. " " manufacturing and disposing of fishing products.
4. " " cold storage.
5. " " fishing vessels and fishing implements.
6. Facilities for transportation.
7. " " cultivation.
8. " " rescue work of shipwrecked fishing vessels.

The amounts of subsidy to be granted will be less than 40% of the cost in the case of the first six, less than 50% for the seventh, and less than 60% for the eighth. Subsidies granted since 1925 are as follows:

		yen
1.	95 cases of facilities for quay and vessel mooring	876,374
2.	81 " " " " the sale of fishing products	177,578
3.	22 " " " " " manufacture and disposal of fishery products	45,884
4.	18 " " cold storage	77,224
5.	55 " " facilities for fishing vessels and fishing implements	90,000
6.	16 " " " " the transportation of fish	33,208
7.	74 " " " " " cultivation of fishes	130,000
8.	24 " " " " " rescue of shipwrecked fishing vessels	107,413
Total 384 cases		1,537,856

Organizations Related with Fisheries

Suisankai (Fishery Societies) Suisankai is a public corporation, recognized by the Suisankai Laws of 1921, which has as its purpose the development of fishery. It is an organization covering a particular county or city and includes in its members, in addition to those engaged in fishing, persons having rights to fish and those who manufacture, trade in, or store fishery products. A prefectural suisankai is organized by county and city suisankai of that particular prefecture, and at the head of prefectural suisankai and suisankai located abroad is the Teikoku (Imperial) Suisankai. The functions of suisankai include the encouragement of fishery, the improvement and extension of the manufacture of marine products, the development of fishing districts, protection of aquiculture, etc. It also collects statistics, investigates markets, or engages in brokerage, etc. On the social side, the rescue of shipwrecked vessels, improvement of relations between employers and employees, employment agency work, mediation in labour troubles, etc., are looked after by the societies. And lectures on fishery subjects, exhibitions and fishery shows are held by them. The number of suisankai, their members, etc. during the last few years are as follows:

SUISANKAI (Fishery Societies)

	1928	1929	1930	1931	1932
Fishery Societies:—					
Total	371	374	377	380	380

Imperial ,, ,,	39	39	39	42	42
Expenditure of fishery societies	2,027,451	1,835,381	1,899,844	1,613,700	1,778,277

Suisankumiai (Fishery Guilds) There are two classes of suisankumiai. The first of these is a corporate judicial person, organized by fishermen or those who are engaged in the manufacture or sale of aquatic animals or plants in a particular district for the purpose of the encouragement and improvement of fishery, cultivation and propagation of aquatic products, etc. The number of suisankumiai is decreasing gradually. At one time there were as many as 220 or more of these Kumiai or guilds, but now there are barely one-fourth of that number. The Act for Suisankumiai in Foreign Waters promulgated in 1902, authorizes any Japanese engaged in fishery or in the manufacture or sale of aquatic products in foreign waters, either by permit or by treaty, to organize suisankumiai. At present Roryo Suisankumiai (Suisankumiai in Russian Waters) is the only one which belong to this class. This guild is formed by fishermen and those engaged in the manufacture and sale of aquatic products in the Maritime Province, Kamchatka, and Saghalien Island. In 1927, its members were 153. Its specially important task is to encourage amicable relations between the Japanese and Russian fishermen working in the same waters and thus ensure the smooth and

Digitized by Google

effective working of the industry in those parts.

Gyogyo-Kumiai (Fishermen's Societies) Gyogyo Kumiai is a judicial person recognized by Fishery Law, and is organized by fishermen living in a particular district. It acquires fishery rights, etc., for member fishermen and takes any measures necessary to further or protect the common benefit of its members.

The principal object of gyogyo-kumiai is the acquisition of fishing rights, etc. This is quite natural in Japan for fishermen work with their village as unit and no fisherman can work independently. Therefore, fishing rights are mostly secured by gyogyo-kumiai, special privileges being given to kumiai for securing them.

Though in the original Act, the object of gyogyokumiai was restricted to the acquisition of fishing rights, etc., the Act was revised in 1910, whereby kumiai had the obligation put on them of undertaking any proper measures that would redound to the mutual benefit of fishermen.

Gyogyo-Kumiai Rengokai are corporations of gyogyo-kumiai. Their principal functions are joint sales of fishery products, cultivation of fishes and rescue of shipwrecked vessels. The history and numbers of gyogyo-kumiai and rengokai are as shown below:

GYOGYO-KUMIAI (Fishermen's Societies)

	1929	1930	1931	1932

Dogyo-Kumiai, etc., Related with Fishery Dogyo means the same trade or profession, hence Dogyo-Kumiai are associations of those connected with the same trade. In relation to the fishery industry they are formed by those dealing in aquatic products, canned foods, salt, cultivation of fishes, etc. In 1930, there were as many as 23 dogyo-kumiai related with the fishing industry. There is also the Dai-Nippon Suisan Kai, which is incorporated according to civil law for the purpose of the improvement and encouragement of fishery.

CHAPTER XVI

FORESTRY

Introduction

Japan is one of the few countries on earth favoured with extensive forests. The area of forests and fields in Japan including Korea, Formosa and Saghalien Island, was 44,752,404 ha. in 1932 and was about 66% of the whole area of the country, which is 67,467,637 ha. It is about 3.8 times as large as her agricultural land.

Since Japan forms a long narrow chain stretching north and south from the northern extremity of the Kurile Islands to the southernmost point of Formosa, and since her mild climate is very favourable for the growth of plants and trees, it is natural that there should be a thick growth of many varieties. There are as many as 1,500 kinds, of which principal forest trees alone number more than 100. In point of richness in variety, she occupies a high position even among countries which are favoured with larger forest areas. While the amount of timber produced is valued at roughly ¥300,000,000 annually it is still far less than 10% of the value of the total staple products of the country and is not at present enough to fill domestic requirements. Every year it is necessary to import about 10,000,000 koku of lumber, equivalent in value to ¥100,000,000. Furthermore, forestry offers very limited labour opportunities. As compared with agriculture, which gives work to one-half of the total families in Japan, and fishing, which finds employment for 1,500,000 people, the number of persons engaged in forestry is small, being less than 720,000.

Distribution and Character

Forests in Japan stand, roughly speaking, in four different zones: sub-tropical forest zone, evergreen broad leaved forest zone, the deciduous broad-leaved forest zone and coniferous forest zone.

The sub-tropical forest zone This covers the whole of Formosa, the southern half of the Loochoo Islands, including the Yayéyama Islands, the annual mean temperature in it being over 21° C. As to the altitude, the zone varies from below 2,000 metres above sea level in the southern part of Formosa to below 1,000 metres above sea level in the northern part of the same island. In this zone, binroji, tsuga, (Arenga sacchariferа) basho-banana and bamboo are found.

The evergreen broad-leaved zone This comprises Shikoku, Kyushu, the northern part of the Loochoo Islands and the southern part of Honshu (Main Island) (at 36° N. Lat. and Southwards), the annual mean temperature of this zone being 13°-21° C. As to the altitude, it is 854 metres on an average in Kyushu, 762.5 metres in Shikoku and 610 metres in the southern part of Honshu. Trees which grow in this zone are kusunoki (Cinnamomun camphora, Nees), oak, akamatsu (Pinus densiflora), white fir, tsuga (Tsuga sieboldi, Carr), etc.

The deciduous broad-leaved zone This zone covers the northern part of Honshu, the southern part of Hokkaido and a greater part of Korea,

Digitized by Google

the annual mean temperature in this zone being from 6° C. to 13° C. As regards the altitude, it is from 976 metres to 1,372.5 metres in the northern part of Honshu and 457.5 metres in the southern part of Hokkaido. Trees which grow in this zone are cedar (the Japanese cypress), white fir, todo-matsu (Abies sachalinensis, mast), ezo-matsu (Picea ajanensis, Fisch), beech, poplar, white birch, etc.

The coniferous zone This zone covers the northern half of Hokkaido, the group of the Kurile Islands and the Saghalien Island, the mean temperature of which is 6° C. to below zero. This zone starts at the height of 1,000 metres in Honshu and ends at the height of 2,592.5 metres in the same island, while it ends at the height of 1,067.5 metres in Hokkaido and 610-762.5 metres in Saghalien Island. Principal trees which grow in this zone are ezo-matsu and todo-matsu.

Forests in Kiso district extend over mountain regions which range from 305 metres to 3,050 metres above the sea level along the course of the upper stream of the River Kiso. It covers 104,055 ha. in area and its growing stock amount to 28 million cu. m. Principal trees are the Japanese cypress, the swamp-cypress, sawara (Chamae cyparies obtusa S. et Z), nezuko (Thuja japonica, maxim) and parasol-pines. They are old and are thickly grown. The reason that they are retained so well is due to the fact that during the feudal times, the cutting down of these trees was prohibited. Among these, the most magnificent trees are the Japanese cypresses which are about 190 years old. Most of them are 0.46 metre in diameter and 27.45 metres in height.

Forests of sugi in Akita district are widely distributed along the Yoneshiro and Omono Rivers, and belong to the Government. The forests cover an area of about 43,000 ha. and hold stock of 16 million cu.m. The forests, where they are not mixed with other trees, are beautiful and magnificent to look upon. Most of the sugi in these forests are from 120 to 200 years old, and in a dense part the stands hold as much as 1,400 cu.m. per ha. Some of them are so large that their diameter reaches sometimes to 1.22 metres. The forests are noted for the abundance of timbers of a superior quality. Annual cutting from these forests amounts to 280,000 cu.m.

Area of Forests, etc.

According to 1930 Census the total area of Japan was as follows :

Districts	Total area	Forests and scrubland	Paddy fields	Other Cultivated land	Others
	ha.	ha.	ha.	ha.	ha.
Entire country	67,506,894	44,752,404	5,186,309	5,910,804	11,657,377
Korea	22,074,072	16,351,857	1,604,327	2,748,067	1,369,821
Formosa	3,597,355	2,465,074	396,669	415,445	320,167
Saghalien Island	3,608,976	2,906,746	—	27,997	674,233
Hokkaido	8,877,504	6,425,310	206,610	657,749	1,587,835
Japan Proper	29,348,987	16,603,417	2,978,703	2,061,546	7,705,321

The area of forests, according to ownership and districts, in 1930, was as follows :

Note: The investigation for the area is made at the end of every three years.

Stock of Growing Timber

Japan Proper To ascertain the amount of growing timber owned by the Imperial Household, Government, and public and private interests careful investigations are made, the investigations in the case of public and private interests being carried out by each prefecture. The following statistics show the growing timber in Japan proper in 1932 classified according to ownership: Quantities in 1,000 cu.m.

Kind	Crown	Government	Public and Private			Total	%
			Public	Shrines and temples	Private		
Coniferous trees	32,452	137,208	71,172	7,333	327,510	575,675	46.0
Broad leaved trees	14,121	318,190	83,503	5,000	252,823	673,637	54.0
Total	46,573	455,398	154,675	12,333	580,333	1,249,312	—
%	3.7 %	36.6 %	12.4 %	0.7 %	46.6 %	—	—

Thus the total standing timber in Japan proper is 1,249,312,000 cu.m., of which coniferous trees account for 575,695,000 cu.m. and broad-leaved trees 673,637,000 cu.m.

Of the total growing stock, public and private interests own about 59.7%, the Imperial Household owns about 3.7% and the Government 36.6%. When we examine the ownership of coniferous forests, the Imperial Household and the Government possess together only 20.9%, while the remaining 79.1% is in public and private possession. However, in the case of broad-leaved trees, the Imperial Household and the Government together own about 49%, while the rest own 51%.

The growing timber per unit area of one hectare is 113 cu.m. for the Imperial Household, 113 cu.m. for

Digitized by Google

the Government and 237 cu.m. for the rest.

The stock of growing timber per unit of area is very small in the case of public and private ownership because reafforestation has never been vigorously encouraged. The same is true with regard to afforestation, which could be carried out on a very large scale in the "genya" areas, treeless wild lands covered with various graminaceous weeds, which offer great opportunities for conversion into forests, but which to the present have been greatly neglected.

Other Parts The following table shows the number, ownership and type of trees in other parts of the country.

STANDING TIMBER IN HOKKAIDO, FORMOSA, KOREA AND SAGHALIEN ISLAND IN 1932

(Quantities 1,000 cu. metres)

Private	391,895	306,213	698,108
Total	1,164,495	1,312,561	2,477,056

Afforestation

As previously mentioned there is great scope for the practice of afforestation in Japan because of the large "genya" areas, plains where there is only a thin growth of trees, and forests where there are many undesirable trees. However, since a great deal of timber is being cut, reafforestation becomes more urgent every year.

Afforestation is divided into two classes, viz., natural and artificial.

Digitized by Google

Natural afforestation is being carried out in only a small portion of the Crown and Government forests, while in most of the public and private forests, conditions are such that no definite plans for natural afforestation have been made. However, as this is liable to cause forests to go to waste careful studies are being made to improve the situation.

In artificial afforestation Japan has had some good experience and artificial afforestation for the Imperial and Government forests is being carried out on a well-planned basis.

Areas under natural and artificial afforestation at the end of 1933, according to ownership, are as follows:

ARTIFICIAL AFFORESTATION

Owners	Coniferous	Broad-leaved	Mixed	Bamboo groves	Total
	ha.	ha.	ha.	ha.	ha.
Crown	5,044	69	—	—	5,113
Government	11,092	810	2,479	—	14,382
Public { by Gov't	20,284	343	—	—	20,627
Public { by public	15,234	2,946	—	10	18,191
Shrines and temples	503	60	—	2	565
Private	44,151	10,661	—	485	55,297
Grand total	96,311	14,890	2,479	499	114,179

NATURAL AFFORESTATION

Owners	Coniferous	Broad-leaved	Mixed	Bamboo	Total
	ha.	ha.	ha.	ha.	ha.
Crown	156	1,984	7,391	—	9,531
Government	3,882	16,997	38,466	—	59,346
Public	10,192	20,932	9,662	—	40,786
Shrines and temples	183	563	353	—	1,099
Private	18,219	81,654	30,014	—	129,887
Total	32,633	122,131	85,886	—	240,651

The following table shows the history and tendency of artificial afforestation:

Year	Total area under afforestation	Crown	Public			Private
			Government	By Public bodies	By the Government	Shrines and temples	
	ha.	ha.	ha.	ha.	ha.	ha.	ha.
1921	96,409	4,402	18,504	19,566	—	551	53,385
1927	107,212	3,439	13,352	22,497	8,814	605	58,502
1928	112,618	4,404	13,382	22,137	10,469	634	61,390
1929	110,915	4,130	13,016	20,988	15,394	612	56,772
1930	101,208	4,107	12,579	19,135	10,530	411	54,444
1931	99,612	5,369	11,903	19,589	8,561	578	53,611
1932	110,679	5,010	11,548	18,338	20,635	512	54,633
1933	113,681	5,113	14,382	18,181	20,627	563	54,812

According to the above table, the area under afforestation belonging to the Crown shows a tendency to increase, that of the Government

Digitized by Google

shows a decided decrease until 1933, while the area belonging to public and private interests shows on the whole an increasing tendency. During, and for some time after, the World War, afforestation was not carried on because of the high cost of labour and of young plants, but since 1921, as the price of young plants declined and labour became more readily available it has been resumed.

In order to develop work of afforestation, it is important to grow a great number of young plants at a very low price and nursery work in this line has developed a great deal lately. The area of seedling ground in 1933 for Government owned land was as large as 3,235.7 ha.

Clearing of Forest and Bamboo Areas

The area of land cleared, together with the quantity and value of timber and bamboo produced in 1933, is shown in the following table. The changes in clearing in the past 6 years is given in the second table.

CLEARING OF FOREST AND BAMBOO LAND IN 1933

Owners	Area	Timber				Bamboo	
		Lumber		Firewood

Production of Lumber, Firewood, Bamboo, etc.

Perhaps no other country consumes timber in such large quantities as does Japan, yet until 1920 she was able to export. During and after the World War every branch of industry in Japan developed with unusual rapidity with a consequent heavy increase in consumption of lumber, and moreover, the increase in population has contributed in no small way to increased consumption, the result being that large quantities of lumber have had to be imported in recent years.

1933	138,677,128	56,296,382	88,686,606	45,820,794	75,009,416	10,475,588	13,677,190

Year	Fuel wood		Bamboo	
	Quantity	Value	Quantity	Value
	Tana*	yen	bundles	yen
1928	17,894,949	71,965,363	5,775,522	5,721,122
1929	17,858,076	62,308,117	5,471,731	4,918,286
1930	17,715,546	47,683,233	4,899,853	3,820,599
1931	18,011,078	43,533,840	5,005,507	2,850,214
1932	18,396,510	43,473,724	5,191,998	2,697,229
1933	19,081,269	47,393,732	5,172,564	2,596,790

Note: 1 tana is equal to 2.78 cu. m. "Tana" literally means "shelves."

In 1933, the total forest area cleared was 412,166.1 chobu and the value of timber, firewood and bamboo amounted together to ¥138,677,128. As far as the area of forests actually cleared in the last decade or so is concerned that of 1919, with over 515,000 ha. was the greatest, while that of 1922, about 277,000 ha. was the smallest. In ordinary years, the area cleared is somewhere near 300,000 ha. For the value of produce, 1919 was also the record year. The total output was over ¥345,000,000. Since then values have gradually decreased.

Comparing the figures of various forest products for 1933, it is found that the figures for timber accounted for more than 50% of the value.

	cu. m.	yen
Timber	15,665,299	88,686,606
Fuel wood	52,975,247	47,393,732
Bamboo	5,172,564	2,596,790

The following table shows the timbers classified according to the two large divisions:

	cu. m.	yen
Coniferous trees	12,750,311	75,009,416
Broad-leaved trees	2,914,987	13,677,190

The reason that the quantity of broad-leaved trees cut down is small is that such trees mostly grow in districts where transportation is difficult and the cost of cutting is high. However, when transportation facilities improve and buildings of Western style become more popular, there will be a larger demand for timber from latifoliate trees and more will have to be felled.

Production of lumber in 1933 classified according to ownership was:

	cu. m	yen
Crown	1,305,388.1	8,972,238
Government	4,450,617.8	13,555,012
Public	1,143,470.2	4,876,564
Shrine and temple	44,810.0	886,500
Private	8,721,012.9	60,896,192

Products of Government and privately owned forests together accounted for over 80% of the total production.

Fuel wood produced in 1933 was 52,957,310 cu.m. valued at ¥47,393,732. Values, according to ownership, were as follows:

	yen
Crown	441,703
Government	3,183,472
Public	4,583,668

Digitized by Google

Shrines and temples	¥ 219,876
Private	88,925,524

As regards bamboo, the total production in 1933 was 5,172,564 fagots of which 4,953,678 fagots, 91 per cent. of the whole, were produced in the private forests.

Charcoal and Other Products

In addition to lumber, firewood and bamboo, forests yield other products such as charcoal, brushwood, mushrooms, bamboo shoots, etc., as the following table shows:

(Quantities in 100 kg., value in 1,000 yen)

Year	Total Value*	Charcoal		Grass, green	
		Quantity	Value	Quantity	Value
1928	138,468	18,369,080	99,315	38,042,526	17,508
1929	128,016	18,117,396	90,633	39,079,762	16,348
1930	96,096	17,240,905	64,950	37,895,538	14,555
1931	89,259	18,203,461	59,365	41,095,910	13,962
1932	91,888	18,870,446	61,579	46,715,295	14,557
1933	109,440	19,776,964	76,157	49,318,759	15,575

* Note: The total value of forest products includes, besides the values of charcoal and brushwood, those of mushrooms, bark, fruits, berries, bamboo shoots, rosin, etc.

The total value of forest products other than lumber, firewood, and bamboo in 1933 was ¥109,437,960, the values of the more important of them were:

	kwan	yen
Charcoal	527,385,721	76,154,605
Brushwood	1,315,166,918	15,575,542
Bark	—	1,798,159
Berries	—	3,623,573
Mushrooms	(kin) 12,206,396	6,416,215
Bamboo shoots	18,425,618	3,823,961

Charcoal is widely used in Japan. In Europe and America it is chiefly used for industrial purposes but in Japan 70% of the consumption is for heating and cooking. While the use of gas, electric heat, etc. for these purposes is increasing, the demand for charcoal does not decrease, and about 500,000,000 kwan of charcoal produced at home are consumed every year. A small quantity, about ¥191,790 in value, was imported in 1932.

Protection Forests†

Besides having a direct value through the produce they yield, forests have a distinct indirect value through their influence on climate, conservation of water supplies, prevention of erosion, etc., and in order that the fullest use may be made of them the Government established a system of "protection" forests. In the following instances, under the Forestry Act, the Government is authorized to decree that certain forests etc., shall be considered as "protection" forests:

(1) When it is necessary to protect against soil denudation.

(2) When it is necessary to protect against sand shifting.

(3) When it is necessary to protect against flood, wind and tide.

(4) When it is necessary to protect against avalanches and rolling stones.

(5) For conservation of water supply.

(6) For fishery purposes.

(7) For guiding navigators.

(8) For public health.

(9) For scenery.

The area of protection forests in 1933 was as follows:

† The word forest here and throughout this sub-section is understood to include woods, groves, copses, etc.

Owners of protection forests, etc., cannot, according to the provisions of the Forestry Act, cut down the trees, take the forest products from them nor utilize them for any purpose, unless with the approval of the authorities concerned. Protection forests are divided into two classes for administrative purpose. In the first class are forests in which limits for cutting and utilization are fixed, while in the second are those, the cutting of which is absolutely prohibited. Any owner who has his forest included in the second class and suffers any loss by this inclusion will have the loss reimbursed by the Government.

The changes in area of protection forests are shown below:

Year	Total		Cutting limited		Cutting prohibited	
	No.	Area	No.	Area	No.	Area
		ha.		ha.		ha.
1919	319,079	1,529,498	314,241	1,335,405	4,838	194,053
1927	376,590	1,887,951	372,416	1,646,087	4,174	241,864
1928	381,313	1,887,002	377,146	1,649,188	4,167	237,815
1929	386,317	2,045,353	382,164	1,807,391	4,153	237,815
1930	391,353	2,057,906	387,180	1,819,823	4,173	238,803
1931	393,952	2,067,484	390,335	1,834,231	3,617	233,253
1932	394,589	2,069,592	391,081	1,841,045	3,508	228,561
1933	405,145	2,078,522	—	—	—	221,382

It will be noticed that there has been a yearly increase in the area. The largest owner is the Government which has 927,078.35 ha., the public owns 765,314.08 ha. and private interests 365,280.89 ha. The areas of protection forests owned by the Crown, shrines and temples are so small that they are hardly worth mentioning.

When protection forests are classified according to the nature and kinds of protection, those for conservation of water supply cover 980,990.98 ha., and those for soil denudation 905,430.25 ha., that is to say, about 94% of the protection forests is related to water regulation work.

Utilization of Government Forests

Forests are classified according to ownership as Crown forests, Government forests, and public and privately owned forests. Public and privately owned forests include those possessed by shrines and temples, public corporations and private individuals. Crown forests are those possessed by the Imperial Household and are divided into the hereditary and ordinary ones. Both are under control of the Minister of the Imperial Household, and are in charge of the Bureau of Imperial Forests and Estates. Government forests in Hokkaido are looked after by the

Digitized by Google

local Government of Hokkaido, while those in Honshu (Main Island) are taken charge of by the Department of Agriculture and Forestry. Growth of forests, their utilization, and work of ensuring the public welfare through them are looked after by these offices, which administer them with rational plans for the public welfare.

The Government makes a contract with people willing to carry on afforestation work whereby they are given not more than 80% of the total profit on condition that they follow the Government's instructions as to planting, supplementary afforestation work, and taking care of the trees planted. "Divisional Forests" may be established for this work. A portion of the Government's forests may be put into the custody of shrines and temples and any profits arising therefrom may be used by the shrines and temples. Such forests constitute "Forests in Custody." Sometimes the Government may appoint a particular city, town, or village to protect Government forests which are situated within the jurisdiction of that city, town or village, payment for the work being made by part of the products of that forest being handed over to the city, town or village (Commission forests). In addition, the Government may lease its forests for the purpose of the development of industry in a particular district, or for the purpose of assisting people living near the forests. In some cases no rent is charged. The ground may be used for grazing, grass, or gathering fuel. The Government may sell some of its forest land if it is suitable for reclamation. Forests which are used for these purposes are of a vast area. Figures for March, 1934 follow:

Protection forests	533,152 ha.
Divisional ,,	44,558
Forests in the custody of shrines and temples	25,508
Commission forests	60,488
Forests leased for industrial purposes	75,713
,, for grazing	119,409
,, as grass fields	162,338
,, for gathering fuel	1,010,615
,, ,, reclamation	23,602
Total	2,023,464

Taxes cannot be imposed on Government forests which come within the area of any city, town, or village. But in view of the fact that it owes a great deal to the city, town or village for controlling and managing these forests, the Government has decided to pay to that particular city, town or village a sum equivalent to the amount of the local tax which those forests would bear if they were owned by private individuals.

Forestry Associations
(Shinrin Kumiai)

Forestry associations are those judicial persons recognized by the Forestry Act of 1907, which are formed not for profit but for safety of the country, conservation of water supplies, protection of forests, etc. The nature of their work is to allow members to plant, fell, carry, guard, or sell timber under unified control and rational management. Forestry associations are classified according to their objects into four classes, viz., afforesters' associations, business associations, coolies' associations, and protection associations.

The number of forestry associations in 1933 was 1,734, and the area covered was 1,259,575.0 ha. The growth of forestry associations in recent years is shown in the following table:

Labour for Forestry Work

People engaged in forestry work may be divided into the following classes, those employed in afforestation, those working in the plant nurseries, those clearing woods and lumbering, those carrying and storing lumber, those making charcoal, and those engaged in the production and collection of by-products of the forests. Ordinarily they work for wages. Some of them are exclusively engaged in the work, but most of them work in forestry along with work in other fields, as the following statistics for 1930, 1931 and 1932 clearly show:

JAPAN PROPER (Hokkaido excluded)

Owners	Male	Female	Total	16–60 years	Under 16 years and over 60 years
Crown (March, 1933)	—	—	—	—	—
Government (March, 1934)	323,411	83,085	406,496	393,893	12,603

Forest Damage and Insurance

Forests are subject to damage by fire, wind, snow, etc., damage and loss by fire being especially great. As the forestry business requires an investment which covers a long period of years it is essential to insure, for if a forest is swept by fire, not only the capital invested, but also the care and labour of many years is instantly swept away. The table below shows both the amount of loss and the area damaged by fire, wind, etc., during the last few years. In order to encourage forestry work some means to minimize the loss which arises from fire had to be devised. For many years forest insurance was looked for but it was not until 1920 that the Toho Fire Insurance Co., Ltd., ventured to take on this business. The Teikoku Fire Insurance Co., Ltd., and Tokyo Marine and Fire Insurance Co., Ltd., quickly followed. The first two companies insure only those artificially afforested forests which are older than ten years, while the Tokyo Marine and Fire Insurance Co., Ltd., will insure artificially afforested forests which are not as old as ten years as well as naturally grown forests.

Forest Administration

The central office of forestry administration in Japan at present is the Forestry Bureau in the Department of Agriculture and Forestry. Under this Bureau, there are six Forestry Administration Offices, 218 Forestry Administration Stations and 1,544 administrative districts.

In the office of the Forestry Bureau there is a Section of General Affairs, a Section of Forestry Business, and for the administration of privately owned forests there is a Public and Private Forests Section. For experimental work there are, under the direct supervision of the Minister of Agriculture and Forestry, Forestry Experimental Stations. Forestry Administration Offices are located in Aomori, Akita, Tokyo, Osaka, Kochi, and Kumamoto cities, and are under supervision of the Minister of Agriculture and Forestry. The work of each office is to plan the afforestation work of Government and public forests, to establish or eliminate Government forests, to start civil engineering work, to sell forests, etc. They also supervise the works of forest administra-

Digitized by Google

tion stations which are placed under them. In each office there is a Section of General Affairs, a Section of Forestry Planning, a Section of Afforestation and a Section of Utilization.

Forest Administration Stations, which number 213 in all, are directly concerned with the management and protection of Government and public afforested forests.

In Hokkaido, the Forestry Section in the Development Bureau is the central administration office, and under it there are 19 forest administration offices. About 3,520,000 ha. of forests which are owned by the Government are administered by these 19 offices, the average area controlled by one office being about 185,000 ha.

The proper policing of various forests is carried out as follows :

FOREST POLICE

Owner	Forest Districts and Number of Police	
Crown	Number of allotted districts ; Japan proper	233
	Persons in charge of allotted districts : Japan proper	185 men
Government	Number of districts in Japan proper	1542
	„ „ persons in charge	1,198 men (Dec. 1931)
	„ „ districts in Hokkaido	240
	„ „ persons in charge	226 men (Dec. 1929)
Public	Ordinarily the police look after these ; but in the following 8 prefectures there are forest police facilities : Aomori (8), Miyagi (1), Fukushima (11), Yamaguchi (8), Yamanashi (44), Aichi (16), Saitama (1), and Oita (2) (Figures in parenthesis are number of forest police in March, 1931)	
Shrines and temples	For the public forests in Hokkaido, members who take charge of allotted districts look after :	
	Number of allotted districts	61
Private	Number of persons in charge	61 men

Forestry Education

College Education Forestry education in Japan began with the establishment of a forestry school in Nishigahara, Tokyo, in 1882, under supervision of the Forestry Bureau. This school later became the Tokyo Forestry School and by the University Ordinance of 1890 was incorporated as a branch of the Department of Agriculture of Tokyo Imperial University. Morioka and Kagoshima Higher Forestry Colleges were established in 1903 and 1904 respectively. The forestry education that was being carried on in Sapporo Agricultural College in Hokkaido, became a laboratory course when the college became a Department of Hokkaido Imperial University. During the World War, facilities for education were greatly extended, and Departments of Forestry were added to Kyoto and Kyushu Imperial Universities, while higher forestry colleges were established in Miyé, Utsunomiya, Gifu, Miyazaki, and Suigen in Korea and Taihoku in Formosa. By 1926, there were 744 graduates of universities, and 2,589 who had passed through various colleges.

Each university and college has its own speciality. Kyushu and Hokkaido Universities give lectures on Forestry in Tropical and Arctic Zones respectively, and graduates of these universities are mostly working in the colonies. Each university has forests for experimental purposes (Consult Chapter XLII, For-

Digitized by Google

ests for University Field Work).

Most higher colleges are comparatively new but they each have their speciality. Some of them have two-year post-graduate courses, while others offer some special courses. Miyé Higher Forestry College is noted for its course in civil engineering for forestry, Gifu Higher Forestry College for its technological course on forestry products, and Utsunomiya for courses on agricultural policy and economics. Gifu Higher Forestry College is specialized in its courses on clearing and carrying lumber making on a mechanical basis, chemical technology of forestry products, etc.

Practical Education The first and second class forestry schools established and supervised by various prefectures give practical lessons in forestry. They exist either as independent schools of forestry, or as a part of agricultural schools. In 1928, in the whole country there were 192 first class forestry schools for boys, and 5 for girls, and 133 second class forestry schools.

In order to encourage forestry, training of experts who have practical knowledge of forestry is very important. These experts are trained mostly in the forestry schools which give practical lessons, but often other methods, as explained in the next section, are adopted.

Supplementary Education For those who have no opportunities to get regular forestry education in schools supplementary forestry education is given in various places, the principal method being by series of lectures given under the auspices of forestry experimental stations, forestry associations or charcoal associations. These lectures are given regularly each year, but in particular cases, when experts are required for the purpose of management of some special forestry work a special course of lectures will be given. In the case of Government forests, supplementary education is given every year to train men who take charge of the forests.

Forestry Experimentation

Central Experimental Station A plant experimental station was first established in Nishigahara, Tokyo, in 1878, to make investigations into the advantages of the cultivation of various plants, the growth of plants, the relation between the forests and climatic conditions of the country, etc. This station was abolished in 1882, but in 1890, the business of forestry experiments was taken up by the Forestry Administration Station of Tokyo. Later, in 1905, upon a pressing need, plant nursery beds was established in Meguro, Tokyo. This nursery developed into a Forestry Experimental Station under supervision of the Forestry Bureau. In 1922, the station was detached from the Forestry Bureau and placed under the direct supervision of the Minister of Agriculture and Forestry. A subsidiary station was also established in the Ogasawara (Bonin) Islands for the purpose of experimenting with tropical plants.

In the Central Experimental Station there are departments of, general affairs, afforestation, vegetable pathology, utilization of forestry products, chemistry, forestry work, and weather and climate. Since 1904 it has regularly issued bulletins on experiments and forest weather, besides occasional other reports. The Station will, for payment, make analysis, carry out experiments and give advice and judgments on matters of forestry for the general public, if requested. The principal items of investigation and study of the station are such as are given below:

(1) Items which are connected

Digitized by Google

with experiments on afforestation. The relation between plants and soil, the nature of seedlings, and methods of afforestation and fostering are investigated and studied. The study of seedlings has been perfected. Special study has also been made in the method of clearing woods, and the result is already applied in practice by various forestry administration offices and stations.

(2) Experiments on the utilization of forestry products. Investigations have been made on the strengths of various kinds of lumber, antisepsis, physical and chemical properties of lumbers, electrical drying etc. In the chemical department studies are made on the method of manufacturing vegetable oils, charcoal, camphor, rosin, etc. Research is also carried out on the production of mushrooms, plantation of medicinal herbs, etc.

(3) Experiments which are connected with both forestry and agriculture. Studies on such as effect of growth of green mannas, fodder, etc. are made.

(4) Experiments and studies on forestry work and protection of forests. The effects of any forestry work on the principal trees are studied. A valuable supplementary table for the calculation of the growth and yields of the principal trees has been completed as the result of many years' study. As to the protection of forests, studies on beneficial and noxious insects and fungi are made. The result of the study on the disease of the Japanese cedar is one of world-wide importance.

(5) Weather observation. Forestry weather bureaux have been established at different places along the principal rivers to observe the temperatures in and out of forests, humidity, rainfall, evaporation, and water contents of soils. Also, the effects of forests on water regulation, the relation of rainfall in forestry districts to floods, the relation of climate in forestry districts to the growth of forests, etc. are observed and studied. In the field of weather observation in forests, comparative studies are made of the possibility of promoting water supply by forested and wild land, the power of forests to retain rain water, and the extent of damage to coniferous trees and their withering during winter, etc. Also studies of the effects of different kinds of weather in various mountains and the effects of rainfall on the principal rivers and lakes are made.

Local Experimental Stations Among the various prefectures Hokkaido is the only one which has a forestry experimental station. It was established in 1908 and for twenty-five years has contributed to the development of forestry in that island. The station makes experiments in afforestation, the utilization of forestry products and the protection of forests. In Kagoshima prefecture, a forestry research bureau was established in 1929. This bureau studies plant rearing, afforestation, etc. and is the only bureau which engages in experimental work in prefectures other than Hokkaido.

Forestry experimentation in Formosa is undertaken by a Forestry Bureau under the Central Research Station in the Government-General of Formosa. It has experimental forests of 52,000 cho. In addition to experiments in afforestation, utilization, and nursery work, it studies the classification and distribution of plants grown in the island. It has two branch stations.

The forestry experimental station in Korea was established in 1922. As the climatic conditions in Korea are rather continental the kinds of plants, their distribution, and the

Digitized by Google

nature of forests, etc. differ widely from those in Japan so the results of the experiments made in the Central Experimental Station in Tokyo cannot be directly applied to the forests in Korea. To effect an improvement in forestry work in Korea it was necessary to establish an independent experimental station in that country. The station is comparatively new, but as part of a plan which is to be completed in fourteen years beginning 1925, investigations on the classification and distribution of the plants, experiments in rearing and afforestation of the principal trees, experiments in the prevention of damage from noxious insects and fungi on young plants and forests, tests on lumber and methods of storing, etc., have already been made and reports on the results of the investigations and experiments have been published in the bulletins issued by the station. In the experiments on rearing young plants it has already succeeded in showing the way to quicken their growth, its experimental success in rearing the Korean pines being specially noteworthy.

In Saghalien Island an experimental station was established in 1929. Prior to that experiments were made on frigid zone plants by the Temporary Industrial Investigation Bureau in the Government Office of Saghalien Island in experimental forests near the towns of Toyohara and Horo.

Lumber Trade and Industry

Lumber Trade The lumber trade in Japan can be said to have begun to develop after the Great War. The trade in 1919 was only ¥34,000,000 in value but had increased to ¥142,750,000 in 1924, an increase of 407%. Up to 1920, foreign trade, as far as the lumber trade goes, was in favour of Japan. This was changed in 1921, when a great quantity of American lumber was imported. After the great earthquake which destroyed Tokyo, Yokohama and their vicinities, there was a great demand for lumber for the reconstruction work of these places and imports of lumber from America and Asiatic Russia increased by leaps and bounds. This situation was maintained until 1929, but the following year, 1930, saw a change when the imports of lumber dropped to 8,600,000 koku as against 12,000,000 koku in 1928. The reason for the change can be attributed to the following causes:

(a) Japan's raising of the embargo on gold.

(b) The world-wide depression.

(c) Japan's revision of the import tariff.

(d) Completion of reconstruction work in Tokyo and Yokohama.

Lumber imported into Japan for the year 1934 totalled ¥40,183,000. Though this shows a slight decrease, if compared with ¥40,584,000 of 1933, it was a big increase when compared with that of 1932. Main sources of shipments were the United States, Canada, the Dutch East Indies, Siam and Asiatic Russia, but the United States' share was far larger than the other countries combined. Meantime, the exports of lumber amounted to ¥24,868,000 for the same year, which was a big increase compared with the 1933 figure, viz., ¥19,330,000 and a far greater increase compared with the 1932 outcome which was ¥11,328,000. Chief foreign markets for lumber from Japan in 1934 were Britain, Kwantung Province, China, Manchoukuo, the Dutch East Indies, British India and the Straits Settlements.

1933	700	612	2,550	4,506	347	462	6,825	3,833
1934	952	2,207	4,010	5,779	255	402	6,620	4,639

Wood Pulp Industry In 1914, the consumption of wood used as raw materials for pulp amounted to only 1,160,000 koku, but in 1932 it was 6,978,261 koku, and in 1933 nearly 7,992,000 koku. Japan proper and Korea supply fir, cedar and hemlock-spruce, while Hokkaido and Saghalien Island supply ezo-matsu and todo-matsu. In 1913, lumber grown in Japan proper used for pulp amounted to 127,000 koku, that grown in Hokkaido 852,000 koku and that in Saghalien Island 33,000 koku. The consumption of wood grown in Japan proper decreases every year, while that grown in Hokkaido and Saghalien Island incerases rapidly. In 1927, the consumption of Saghalien lumber was about 69% of the whole, Hokkaido lumber about 27%, and the remaining 4% was grown in Japan proper, Korea and Manchuria.

Resources for pulp. Though the development of the pulp industry was partly due to the increase in

Digitized by Google

demand for paper, it owes a great deal to the abundant supply of lumber. While in 1914 the consumption of lumber was barely 1,160,000 koku, it increased to 7,090,000 during the next 12 years and today the consumption amounts to about 10,000,000 koku a year. However, as explained elsewhere, it requires careful investigation, study and planting to make our forests capable of producing so large an amount every year.

Japan proper has been supplying in the past, fir, cedar and hemlock-spruce as pulp woods, but these are decreasing in quantity, and though they may be used to some extent for pulp, they are more necessary for other purposes and cannot be relied upon indefinitely as raw materials for pulp.

The quantity of ezo-matsu and todo-matsu supplied by Hokkaido as pulp woods is large, but it is difficult to obtain supplies in a greater proportion than at present, therefore the only forests on which the pulp industry can rely for a greater supply are those in Saghalien.

The stock of coniferous trees in Saghalien Island was at one time said to be 1,800,000,000 koku and that of broad-leaved trees 125,000,000 koku. Later investigations have shown, however, that the total growing stock was only 709,000,000 koku, of which coniferous trees made up 637,000,000 koku and broad-leaved trees 72,000,000 koku. Great quantities have since been utilized and the amount available in future is said to be only about 400,000,000 to 500,000,000 koku.

Under such circumstances, it is doubtful whether the forests in Japan can supply all the raw materials her pulp industry will require in future. Thus the establishment of a far reaching forestry policy, encouragement of afforestation, prohibition of rough cutting, etc., are urgently required, and in order to further develop our pulp and paper industry the development of forests in Northern Manchuria and the Maritime Province is essential. In 1933 the total production of various kinds of wood pulp amounted to 620,039 tons from 7,278,883 koku of timber. (See Chapter XXII, Paper, for minutes.) At present a large quantity is yearly imported from foreign countries, the United States being the largest importer. The total amount imported for the year 1934 was ¥44,255,000 against ¥27,066,000 for the previous year.

CHAPTER XVII

MINING

History of the Industry

During the reign of the Emperor Kotoku (645 A. D.), a mineral deposit was discovered in the province of Iyo and experts came over from Korea and China, to work the minerals extracted. Metals were being used for making coins so mining received the encouragement of the rulers. During the time of the Emperor Shomu, (724-747 A. D.) mineral deposits were found in many places and the art of working them made considerable advance, a fact witnessed by the construction of the Great Buddha at Nara, a monument of the metal-working art of those days.

Later, during the time of the Ashikagas, mining made further development, especially in the field of gold, copper and sulphur. Influential lords who held sway in their own localities required metals to finance their army, and mines always proved good objects for fights. Mineral deposits obtained in this manner were well worked and the mining industry naturally developed.

In the time of the Tokugawas metallurgy further advanced. The government coined money which circulated all over the country and naturally the industry was well protected and carefully developed under its ægis. At this time Japan was known throughout the world as a country which abounded in gold and silver, and after the country was opened up to foreign trade the quantity of these precious metals exported was considerable, a business which provided a natural stimulus to gold and silver mining. The government also encouraged private enterprisers to engage in the industry, a result of which was the entry of the Sumitomos. The chief mineral deposits discovered during those times were :

Ashio Copper mine	in Shimozuké Province
Besshi „ „	in Iyo „
Sado Gold mines	in Sado Island
Miiké Coal „	in Chikugo Province
Karatsu „	in Hizen

After the Meiji Restoration the industry did not show much progress until after the Sino-Japanese War of 1884-1885, when the Government called in many mining experts from abroad and employed them in government operated mines, not only to improve, organize and work the mines more efficiently but also to teach the operating of them on a modern basis. The mines improved in this manner were sold to private companies, and the experts who were officials of the Government transferred also, a factor which served to bring the mining industry of Japan to its present stage of development.

Mining Industry in Recent Years

The year 1933 closed with an unprecedented record in recent years, which was doubtlessly caused by the enormous increase of overseas trade and the continued boom of munition industries. The price level of mineral products kept its upward tendency throughout the year, which in turn contributed to accelerate the productive activity. The greatest activity was witnessed in the coal

Digitized by Google

production. Gold was another item which recorded an enormous increase in production owing to its enhanced market price. The high price paid for Government gold and gold bullion, the discount allowed in the railway freightage, the lower charges for the analysis of gold ores and the bounties for the building of gold refineries, all these facilities given by the Government added force to the increase of its production.

Mining applications made during the year 1933 were 8,193 for prospecting, 148 for actual operation and 478 for mining gold dust, with the total number of 8,819. This was an increase of 2,423 (42%) in prospecting, 61 (70%) for actual operation, but a decrease of 106 (18%) in gold dust, as compared with the previous year. The total production in 1933 was valued at ¥358,240,658, an increase of ¥103,458,750 (46%) as compared with the previous year. Coal added ¥53,490,000 in value, as compared with the previous year, copper ¥11,650,000, iron, zinc, sulphur, etc. followed in the list. Of the above, iron deserves special mention. In 1933 the production of pig iron, including Chosen and Manchoukuo, was 2,000,000 metric tons and steel 2,800,000 metric tons, the former satisfying 92% and the latter 100% of home demand.

Exports and Imports The latest returns of the overseas trade show that the exports and imports of mineral products for the year 1933 were ¥73,772,389 and ¥406,090,097 respectively. The increase was ¥25,351,842 in the exports and ¥137,013,951 in the imports. Gains in the shipments of iron to Manchoukuo, of coal to China and Hongkong and of sulphur to Australia account for the increase of the exports, while the increase of the imports owed largely to the increased purchases in foreign markets of iron, petroleum, coal, and others. (For details of exports and imports of mineral products in 1933 and 1934 see Chapter XI.)

* Brown or soft lignite.

Mining of Metals

Gold The removal of the gold embargo was effected in January, 1930, and the outflow of specie during that year reached ¥300,000,000. There was no sign of the outflow abating in the following year, and in consequence the specie holding of the Bank of Japan dwindled to a very low ratio. All these adverse conditions gave rise to demands for the encouragement of gold producing enterprises among the people and resulted in the establishment of a Central Refinery Station (Chuo Seirensho) and of other means for conducting research work. As regards financial assistance extended to the enterprisers, it was so arranged that the Bank of Japan should advance low-interest loans against the mortgaging of the gold produced. The suspension of the gold standard by

Digitized by Google

Britain in September, 1931, greatly influenced the financial atmosphere of this country, the effect of which was to augment the outflow of gold and intensify the tendency, which had become rampant throughout the country, of cornering and hoarding the metal.

With the installation of the Seiyukai Cabinet in December, 1931, gold exports were prohibited and an unprecedented depreciation of the yen and appreciation of gold in inverse ratio took place.

Stimulated by various measures of encouragement, as has been said elsewhere, the production of gold was increased by 9.9% as compared with 1932, despite the fact that the gold refineries, the construction of which was started on the receipt of bounties, were still but half completed. The production in 1933 was 13,701,200 gm. at ¥33,790,368 against 12,469,285 gm. at ¥25,924,770 in the previous year. Chosen produced 11,508,165 gm. and Taiwan, 652,139 gm. in the same year. Gold is mostly refined by two large companies of Nihon Mining Co., Ltd. and Mitsubishi Mining Co., Ltd. The former has its smelteries at Hidachi in Ibaraki and Saganoseki in Oita, and produce about 200 kan a month. In addition to the old gold mine in Sado Island Mitsubishi has an alluvial gold mine at Kintei in Korea, which is producing from 20 to 30 kilogrammes of gold per month. The Kōnomai (in Iwami, Hokkaido) Refinery, which was under construction since 1932, was completed in October, 1933, its capacity being 20,000 metric tons per month. At Taifu, Oita, a refinery with a capacity of 1,500 metric tons per month was completed. Amoh, of Gifu, and Kushikino, and Yamagano, of Kagoshima, have all extended their refineries. At Mitsui-sanru (Teshio, Hokkaido), Amanuma (Gumma), Naguri (Saitama), Oshima (Yamanashi), and Amagi (Shizuoka) built new refineries. In each of the following mines a new refinery will before long be completed: Tsugaru (Aomori), Kuromori (Iwate), Matsukawa (Fukushima), Tajima (Hyogo), Katsuka (Kagoshima), and Suzumino and Hoshino (Fukuoka).

Gold bullion is sold to the Bank of Japan or disposed of in the open market. For quantity and value of production see table "Production of Minerals" above. How the quantities were disposed of is shown below:

Year	Sold to Bank of Japan		Placed on the Market		Market Price (yen)	Remarks
	Quantity (grammes)	Percentage	Quantity (grammes)	Percentage	(momme)	
1927	—	—	8,029,866	100	5.151	
1928	—	—	8,903,297	100	5.345	
1929	411,641	4.6	8,560,028	95.4	5.343	
1930	4,853,628	43.8	6,223,567	56.2	5.040	Gold ban lifted in Jan., 1930.
					(Grammes)	
1931	7,693,306	62.7	4,572,251	37.3	1.366	Gold export prohibited Dec., 1931.
1932		12,721,000	(both together)		2.107	
1933	—	—	—	—	2.687	

According to a statement issued by the Ministry of Finance, gold purchases by the Bank of Japan for the period from April, 1934, to January 15, 1935, were as follows:

Digitized by Google

Aggregate	17,634,908	52,084
Quantity transferred from the Treasury	13,955,539	34,651
Grand total	31,590,448	86,736

The purchase price was ¥2.871 per gramme in 1934. It was raised to ¥3.090 in Feb., 1935.

Silver Affected by the bounds and leaps in the silver quotations in foreign markets and on account of the close relationship of silver with gold smeltering the production of silver increased too, the 1933 production showing 185,610,259 grammes at ¥8,037,277 against 163,625,358 grammes at ¥5,386,849 in the previous year, the quantitative increase percentage being 13%.

Tin Only about one-third of the total demand is being met by home products. To be exact 964,800 kg. was produced at home in 1933 against the total home consumption of 4,471,900 kg., leaving a balance of 3,507,100 to be imported. This import showed a slight increase compared with the previous year. Meantime, a little setback occurred in the home production, being 964,800 kg. in 1933 as against 1,002,280 kg. in 1932.

Osaka Tin Refinery Guild was established in October, 1933. The reproduced tin put out by the members of the guild became such an important factor that its manufacture came to be designated as one of the principal industries by the Government in November, 1934. The sales of the product have been well regulated after the formation of the guild. Before the guild was organized the product contained a good deal of impurities and the production was only two or three hundred tons. As the time went on the technique of refining improved and the production in 1934 went up to five hundred tons. All the product is consumed in the domestic market.

Iron and Steel The record of iron and steel in the recent years was that of expansion. In 1931 the total production of pig iron was 917,342 metric tons, which increased to 1,010,761 metric tons in 1932 and 1,423,889 metric tons in 1933. The same trend of expansion was seen in the incoming shipments, increasing from 494,575 metric tons in 1931 to 650,380 metric tons in 1932 and to 801,283 metric tons in 1933, the aggregate supply being 1,411,917 metric tons in 1931, 1,661,141 metric tons in 1932 and 2,225,172 metric tons in 1933. The same trend is found in the steel production, which increased from 1,662,858 metric tons in 1931 to 2,113,637 metric tons in 1932 and 2,863,155 metric tons in 1933. The incoming shipments of steel materials in the same period were 265,548 metric tons, 235,165 metric tons and 409,861 metric tons according to the order of the aforesaid three years.

Copper Production of copper, unlike those of tin, lead, zinc, or aluminium, was comparatively large in Japan, occupying an important position among metal industries, especially in arms industries. Copper industry developed rather early in Japan. Its production in 1876 was

Digitized by Google

less than 4,000 tons, but Japan was then known throughout the world as the second largest copper producing country, exporting one half of her product. But with the Great War as the turning point, her position as copper exporting country became less important, for new copper beds were discovered in Chile and Congo. Japan then came to occupy the fourth position in the production of copper, and has been compelled to become an importer, the quantity imported increasing every year.

Demanded as an indispensable requisite in the munition manufacturing industries its brisk tone was maintained throughout the year 1933. A noteworthy thing was that, while the 1933 production dropped to 69,032,756 kg. against 71,876,557 kg. in the previous year, its production value which was ¥50,771,985 was higher by ¥11,651,145 compared with ¥39,120,840 of 1932. The copper market in Japan was long under influences of New York and London markets. But since the second half of 1932, owing to the depression of Yen and the increased tariff, it began to regain an independent position of foreign influences. This was well seen in the firm tone of price at home, despite that in foreign markets there occurred an unprecedented decline. The price range was firm at ¥82-83 per kilogramme in August, compared with the ¥70 level in the earlier months of the year, but following the recovery of exchange rates it underwent a setback toward the end of the year, the lowest quotation being ¥72. The average in the year was 21% higher than in 1932. The exports of copper reached 8,512,100 kg. in 1933; 23,121,600 kg. in 1932; and 26,603,200 kg. in 1931, while the imports 17,617,700 kg. in 1933; 1,966,600 kg. in 1932; and 2,019,900 in 1931.

The increasing tendency in the demand was continued during 1934, and the import in the first half of the year reached over 5,000 tons every month. To meet the enhanced demand copper mines extended their equipments, the most important being the improvement of the furnace at Naoshima refinery of the Mitsubishi Mine, the extension of Saga refinery of the Nippon Mine, and opening of a new shaft at Ashio Mine of the Furukawa interests.

DEMAND AND SUPPLY OF COPPER (kilogrammes)

	Production	Import	Total	Export	Home Consumption
1931	75,848,181	2,019,900	77,868,081	26,603,200	51,264,881
1932	71,876,557	1,966,600	73,843,157	23,121,600	50,721,557
1933	69,032,756	17,617,700	86,650,456	8,512,100	78,138,356
1934	32,802,000 (up to June)				

With the development of the machine industry, the demand for copper remarkably increased in 1934, and import in the first half of the year reached 32,802 tons.

Lead The home production of lead barely satisfies 10% of the aggregate demand. In 1933 the total home production was 6,824,687 kg. and the import was 67,254,300 kg. The home consumption increased from 62,368,343 kg. in 1932 to 74,078,987 kg. in 1933, indicating the growing demand for the metal as the industrial activities expand. At Hosokura (Miyagi prefecture) and Nibukoiwa (Fukushima prefecture) new refineries were constructed. At the Budo mine (Niigata prefecture) an electric-refinery was being built.

Digitized by Google

Zinc The origin and development of zinc mining in Japan is of comparatively recent date. In 1900, a Swiss clock firm, seeing bright prospects of developing the industry, purchased many zinc mines in the country and began exporting the metal. From this time the industry developed, the number of men engaged in mining increased, and the exportation of zinc grew in proportion.

Along with the development of other industries there has been an advance in zinc smelting. With increased demand during the World War, production and exports increased, the quantity produced in 1917 reached 54,700 metric tons, and smelting furnaces numbered 16. From the slump of 1920 and the depression which followed it, the industry received a heavy blow. Most of the furnaces were shut down, and only those in Miiké, Takata, and Hiroshima were able to weather the storm. The last named has been especially successful in manufacturing sulphuric acid with the sulphur separated from zinc ores.

Zinc ores in Japan exist mainly in igneous and aqueous rocks. They seldom exist independently, sometimes being found mixed with lead ores. The principal ore which yields zinc is zinc sulphide, some of the best of which contains about 67% of zinc and 33% sulphur. Ordinary ores contain 40-55% of zinc and 24 to 28% of sulphur. The principal places of production are as follows:

Kamioka	Kozan in Gifu	Prefecture	
Budé	,,	,, Niigata	,,
Ikuno	,,	,, Hyogo	,,
Yasuda	,,	,, Nagasaki	,,
Hosokura	,,	,, Miyagi	,,
Kanayama	,,	,, Wakayama	,,
Wanibuchi	,,	,, Shimané	,,
Sasu	,,	,, Nagasaki	,,

Ginya and Maden Kozen in Heiando, Korea
Mimuné Kozan in Keiando, Korea.

The production, import, export, and consumption of zinc follow:

Year	Production		Imports	Exports	Consumption
	Quantity produced	Value			
	kg.	yen	kg.		kg.
1927	17,497,747	6,157,601	31,638,600	—	49,136,347
1928	19,116,950	6,339,605	41,173,500	—	60,290,450
1929	22,099,129	7,197,563	33,287,900	—	55,377,029
1930	24,669,224	6,042,068	27,357,400	—	52,026,624
1931	25,407,089	4,471,742	24,633,600	—	50,040,789
1932	27,043,432	6,032,611	26,571,600	—	52,615,032
1933	30,657,632	9,746,995	32,525,600	—	63,183,232

The production gain in quantity in 1933 over the preceding year was 3,614,200 kilogrammes (13%) and that in the money value was ¥3,713,945 (61.6%)

Iron and Steel Industry

Down to the Meiji Era The art of iron smelting is said to have been known even in prehistoric times in Japan, but no reliable record can be found. The granites found in large quantities in the Chugoku districts, i. e. Okayama, Hiroshima, Tottori, and Shimané prefectures were found to contain a good percentage of magnetite iron from which iron dust was extracted. These places became famous for their iron products and swordsmiths. In the middle of the 19th century, there were as many as 300 smelting works in these districts, but before the Restoration the utility of iron was not well realized and the demand for it was naturally

Digitized by Google

small. Therefore, the iron and steel industry in its modern garb can be said to have begun with the Restoration.

Since the Restoration Early in the Meiji Era, mines were mostly operated by the Government. As the iron and steel industry was considered very important from a military standpoint the Government placed Kamaishi mine in Iwaté prefecture, under its direct management, and established there some smelting works with foreign experts called from abroad. In 1879, two furnaces with capacity of 25 tons each were installed, but, owing to a shortage of raw materials and fuels the enterprise failed.

After the Sino-Japanese War of 1894-1895, the necessity of establishing the iron and steel industry for manufacturing war supplies was very keenly felt, and the Yawata Iron Works was established in 1886. Owing to the increased demand for iron and steel by various expanding industries the Yawata Works were extended in 1906 and again in 1911.

Private iron and steel works have since been established in rapid succession. In 1905, Suzuki Shoten of Kobé established Kobé Seikojo, and in 1907, Nippon Seikojo was established in Muroran with English and Japanese capital. In 1912, Nippon Kokan Kaisha, Ltd., was established, while in Manchuria, Honkeiko Baitetsu Koshi was established in 1910 on joint account of Japan and China.

These iron and steel works expanded tremendously during the World War, and production increased with marvellous rapidity. The 1913 production of pig iron was 240,000 metric tons while the 1918 production had increased to 583,000 tons. During the same period the production of steel increased from 255,000 tons to 537,000 tons. The Mitsubishi Co. established their Iron Works in Kenjiho, Korea, about this time.

Perhaps the iron and steel industry received a heavier blow than any other from the slump of 1920, a blow that was intensified by the decisions reached at the Disarmament Conference of 1921. The price of pig iron fell from ¥541 per ton, the highest price, in July of 1918 to ¥65 per ton in 1921, steel bars fell from ¥451 to ¥132, and steel sheets from ¥1,285 to ¥199. Twelve pig iron manufacturing companies, four steel manufacturers and six steel materials manufacturing companies went out of business. Many small companies were amalgamated with or absorbed by bigger ones, until at present the whole iron and steel industry is controlled by a few powerful houses, Mitsui, Mitsubishi, Sumitomo, Okura, Asano and Okawa.

Many new industries were started during the Great War and as they progressed their demand for iron and steel expanded. Production increased to meet this demand and the 1923 output was greater than at any time during the Great War. The industry received blows from the great earthquake of 1923 and the financial panic of 1927, but with the finances of the largest concerns of the country behind it readjustments were soon made and as demand increased the industry steadily developed.

Iron Manufacturing Industry in 1933

The latter half of 1932 witnessed a brisk tone in the iron and steel manufacturing industry, owing evidently to such new factors as the activities in the munition and heavy industries, the depreciation in the exchange, tariff revisions, etc. This brought about a record demand for 3,270,000 metric tons of steel products. This surpassed the 1928 record of 2,800,000 tons. With pig iron, too,

Digitized by Google

there was a large increase in demands. Consequently, seven furnaces were in full operation in 1933 with a total annual capacity of about 800,000 metric tons. New steel manufacturing hearths and compressors were installed and many equipments were added and perfected.

The 1933 pig iron production was estimated at 1,420,000 metric tons, exclusive of 160,000 metric tons of Chosen and about 430,000 metric tons of Manchoukuo, which represented 64% of the total home consumption and 92% when the aforesaid production of Chosen and Manchoukuo was added. As for steel, whose production of the year was 2,860,000 metric tons, it covered nearly all home demand. In the year under review an epoch-making event took place in the steel and iron manufacturing industries of the country. It was the organization of the Nippon Seitetsu Kabushiki Kaisha under the newly enacted Nippon Seitetsu Kabushiki Kaisha (Japan Iron Manufacturing Co., Ltd.) Law, with an objective of ensuring self-satisfaction of iron and steel. The new corporation is, in addition to the Yawata Iron Works, composed of 6 iron and steel manufacturing corporations with an aggregate capital stock of ¥359,821,000. This is the sum total of capital of the component corporations plus ¥151,000 newly subscribed in the open market.

In this connection a few words should be added as to the supply of iron and steel from Manchoukuo. The Manchurian incident in 1931 marked a turning point in the industrial relations of Japan with Manchuria. One of the most important events that took place since then was the separation of the Anshan Iron Works from the South Manchuria Railway Company as from June 1, 1933, and the Works became affiliated to the Showa Steel Works. The production estimates of the Showa Steel Works after March, 1935, in which month all the extension projects will be completed are estimated as follows:

Pig iron	180,000	metric tons
Steel materials	200,000	" "
Rails and big scales	70,000	" "
Small scales	33,000	" "
Black sheets	30,000	" "

DEMAND AND SUPPLY OF IRON ORES IN JAPAN PROPER

(in metric tons)

Year	Amount produced	Amount imported	Amount imported from Colonies	Amount exported to Colonies	Demand	Percentage of production to demand
1928	157,706	1,616,974	225,389	—	2,000,069	8%
1929	177,556	1,944,786	314,134	4,299	2,432,177	7

1934 (estimate)	350,000	2,132,001	—	—	—	—

Pig Iron Pig iron is produced by Nippon Seitetsu Kabushiki Kaisha (Japan Iron Manufacturing Company). Coke is mostly used in its production, the amount produced with charcoal being so small that it is hardly worth mentioning. The amount of production classified according to the mode of production and raw materials from which it is produced is as follows:

Digitized by Google

Year	From iron ore with coke	From iron ore with charcoal	Reproduced	From ores	Total
1927	884,341	—	10,905	925	896,171
1928	1,077,065	381	14,287	853	1,092,536
1929	1,065,908	2,000	19,138	82	1,087,128
1930	1,136,853	241	24,748	57	1,161,894
1931	896,445	—	20,897	—	917,342
1932	998,447	1,253	15,837	224	1,010,761
1933	1,408,502	—	19,924	463	1,423,889

During the war, Japan had the bitter experience of having her supplies of iron and steel cut off from Great Britain and the United States of America, and in view of this the Nippon (then Yawata) Works has steadily extended its production capacity. The 1930 production was 2.5 times that of 1919.

Japan requires about 1,500,000 tons of pig iron every year. Her own production is not enough to meet this requirement and the shortage is filled by importing from Korea, Manchoukuo and India.

PRODUCTION OF PIG IRON IN JAPAN AND MANCHOUKUO (in metric tons)

Steel and Steel Materials Steel ingots are produced mostly from pig iron, principally by the open-hearth process. The Bessemer process is sometimes employed by small mills, but the number of mills which use either this or the crucible method is small. Recently the electric process of production has been gaining ground. The amount of steel produced by different methods are shown below.

PRODUCTION OF STEEL INGOTS (in metric tons)

Method of production	1927	1928	1929	1930	1931	1932	1933
Open hearth	1,569,552	1,863,391	2,238,198	2,225,451	1,828,823	2,325,306	3,456,347

The annual requirement of steel materials in Japan is about 2,000,000 tons. Though the production in the country has greatly increased of late a quite appreciable quantity is still imported. The following statistics show how the demand is met.

DEMAND AND SUPPLY OF STEEL MATERIALS (in metric tons)

	1928	1929	1930	1931	1932	1933
Production	1,720,489	2,033,880	1,921,066	1,662,858	2,113,637	2,863,155

Coal Mining

Coal surpasses all other mineral products both in quantity and money value, the 1933 production being 32,523,746 metric tons at ¥195,467,264. This production, compared with 28,053,375 metric tons in 1932, showed an increase of 4,470,371 metric tons (15.9%) and its money value, compared with ¥141,976,783 in 1932, an increase of ¥53,490,481 (37.7%). Prior to August, 1932, the coal industry was among the most depressed in the country. The total stock in warehouses was always up to somewhere about 3 million metric tons. The agreement entered into among coal miners for the restriction of its production had been rigidly in force. The imports of Fushun coal in an unrestricted quantity, however, caused them to take a concerted action in order to influence the authorities to bring pressure upon the South Manchuria Railway Company so as to restrict its shipments of coal to Japan. Such was the situation in which the coal industry in Japan found itself when in September in that year the turn for prosperity set in. This was made possible by great activities in the manufacturing industries, aided with the increased foreign trade due to the depreciated

Digitized by Google

yen. The whole coal stock, therefore, rapidly diminished and the price jumped upward. Meantime, the Showa Coal Company, Ltd., an organ for the sales unification of coal, was satisfactorily organized toward the close of 1932. The year 1933 was a really prosperous year for the coal industry. As was shown in the above the coal production in that year was an unprecedented one in recent years and the whole stock was at the end of April reduced to 950,000 metric tons, below the normal stock of 1,500,000 metric tons as agreed on among the miners. It was natural, therefore, that they now began to complain of the ban put upon production. So the Coal Miners' Association took action and decided to permit the increase of production of about 1,400,000 tons over the 1932 basis of 18,750,000 tons. But this extension of the restriction limit proved too small and, through force of demand, the aggregate production exceeded further by 220,000 tons within the first half of 1933. This limit, however, was still too small in view of the incessantly increasing demand, wherefore the Federation was forced to further extend the limit at three different times since July and to permit the production of 3 million tons more in aggregate. The inward shipments of Manchurian coal was at the same time allowed to be increased by 1,325,000 tons. Coal producers not belonging to the Federation did also their utmost to meet the new situation. Despite all these efforts for the increase in production the reserved stock did not exceed 1,000,000 tons and so the market continued its firm tone. The 1933 demand for coal was estimated at 35,400,000 tons, the highest record ever seen in Japan. The estimated demand showed an increase of about 5,500,000 tons, compared with the previous year. That the incoming shipments from Manchoukuo was not as great as had been desired was due to the increased demand for the commodity in Manchoukuo itself. Details follow:

	1933	1932
Coal actually marketed	32,442,000	28,053,000
Coal imported	3,441,000	2,673,000
Coal stocks at the beginning of	1,848,000	2,250,000
Total coal output	37,371,000	32,976,000
Coal exported	1,536,000	1,366,000
Coal stocks at the endof	1,226,000	1,848,000
Coal demand in Japan Proper	34,969,000	29,762,000

Japan's coal production since 1912 follows:

(In 1,000 metric tons)

1912	19,639	1913	21,815	1914	22,293
1915	20,490	1916	22,910	1917	26,361
1919	28,029	1919	31,271	1920	29,245
1921	26,220	1922	27,701	1923	28,948
1924	30,110	1925	31,459	1926	31,426
1927	33,530	1928	33,860	1929	34,257
1930	31,376	1931	27,987	1932	28,053
1933	32,523	1934	37,200		

Business results of the coal-mining companies in recent five years were:

Digitized by Google

	No. of companies	Authorized capital	Reserve fund
1928	105	¥386,413,700	¥26,868,288

1932	4,674,374	3,826,245	9,514,950

Coal Deposits No survey of coal resources was undertaken between the years 1911 and 1931, but in the latter year the Mining Bureau of the Department of Commerce and Industry commenced a survey which took 2 years to complete. The results, compared with the 1911 survey, are:

	Investigation in 1932				
	Anthracite Natural Coal	Bituminous Coal	Lignite	Total	Percentage
Amount, already mined	29,888	984,130	6,965	1,020,483	5%
Amount, unminable	39,332	991,673	18,859	1,049,864	6%
Amount, minable	718,782	15,499,091	473,460	16,671,333	89%
Percentage	4%	93%	3%	100%	
Amount minable					
Actual deposits	454,745	5,439,905	65,765	5,960,415	36%
Probable deposits	131,944	3,780,975	132,582	4,045,501	24%
Possible deposits	132,093	6,278,211	275,113	6,685,417	40%

	Investigation in 1911			
	Coal	Lignite	Total	Percentage
Amount, already mined	283,200	—	283,200	3%
Amount, unminable	—	—	—	
Amount, minable	8,792,000	347,570	9,139,450	100%
Percentage	86%	4%	100%	
Amount minable				
Actual deposits	822,000	75,770	897,770	10%
Probable deposits	2,940,000	205,000	3,145,000	34%
Possible deposits	5,030,000	66,700	5,096,700	56%

Note: "Amount unminable" indicates the deposits, such as portions between pits, officially prohibited regions and where no pick is allowed.
"Probable deposits" as judged geologically and from conditions of coal seams and which can be presumed as available in future.
"Possible deposits" represent the deposits imagined to be there and are the most uncertain of all.

Petroleum

Production The home yield of crude oil until about 1916 was approximately 2,600,000 koku, by no means sufficient to satisfy domestic demand. Notwithstanding every yearly increase in demand output was unable to keep pace with it so that by 1927 domestic production was only able to satisfy 25% of the home consumption. The percentage has since increased and in 1932 was about 44%.

According to investigations conducted by the Nippon Petroleum Oil Company, the most important producer of crude oil, wells with a daily output of 20 kilolitres (approximately 111 koku) and over numbered no more than the following 7.

Demand and Supply One of the most conspicuous features in the oil production for the three years, 1931-1933 inclusive, was the marked increase in the use of foreign crude oil in the manufacture of heavy oil, 205,310 hl., 507,623 hl., and 1,062,168 hl. being the amount so manufactured in the three respective years. In sharp contrast to it the supply of the heavy oil manufactured out of home crude oil decreased in the same three years from 593,640 hl. to 214,203 hl. As for the import of foreign oil, heavy oil headed the list which amounted to 14,292,801 hl. in 1933 as against 13,709,507 hl. in 1932 and 11,806,000 hl. in 1931. Next comes gasolene, which amounted in 1933 to 4,625,860 hl. against 4,401,440 hl. in 1932, and 3,997,620 hl. in 1931. Korosene dropped in the three years from 635,810 hl. to 576,510 hl. The same tendency was seen in machine oil, which decreased from 376,610 hl. to 241,140 hl. In the aggregate the importation of foreign oil increased in the three years under review from 16,017,090 hl. to 18,459,940 hl. Below are given detailed figures on the supply and demand of oil :

SUPPLY AND DEMAND OF OIL (in hl.)

Classification	Year	Production			Imports
		From home oil	From foreign oil	Total	
Gasolene Oil	1931	799,680	2,134,980	2,934,610	3,997,620
	1932	628,474	3,105,810	3,734,284	4,401,440
	1933	394,737	3,533,429	3,928,166	4,625,860

CHAPTER XVIII

THE TEXTILE INDUSTRY

Introduction

The use of foreign-style machinery in Japan began in the Meiji Era, when cotton spinning equipment was imported from Europe and the United States. After that time the spinning industry gradually developed along modern lines, a development that was extended to weaving as well. The total capital invested in the Japanese textile industry amounts to ¥1,207,000,000, giving employment to more than 907,000 operatives, which corresponds to 47.8 per cent. of the total industrial operatives in Japan.[1] The products of spinning and weaving of all kinds account for 37 per cent. of Japan's industrial production. The total production of textiles in Japan for 1933 was ¥2,914,155,000, an increase of ¥702,067,000 over the previous year. Of this, the production of cotton yarns headed the list with ¥727,959,0000 against ¥542,810,000 of 1932, followed by cotton fabrics ¥569,708,000 against ¥366,506,000 of 1932; raw silk ¥510,166,000 against ¥439,087,000 of 1932; silk fabrics ¥208,603,000 against ¥181,258,000 of 1932; wool, wool-cotton and other mixtures ¥177,096,000 against ¥121,578,000 of 1932; and hosiery ¥62,878,000 against ¥52,320,000 of 1932. The year 1933 marked the pinnacle of Japan's fibre industry. Except raw silk, the industry was outstandingly prosperous.[2]

Japan profits about ¥200,000,000 a year from the fibre industry. The country imports ¥800,000,000 worth of raw cotton and wool as materials for fibre manufactures and exports ¥1,000,000,000 worth of fibre. These exports for 1934 were as follows:

	1934 (In ¥1,000)	Compared with 1933	
Raw silk	286,793	de.	104,108
Cotton fabrics	492,351	in.	109,136
Woollen ,,	29,848	,,	17,472
Silk ,,	77,487	,,	13,943
Rayon ,,	113,484	,,	86,103
Rayon yarns	22,399	,,	12,916
Cotton yarns	23,484	,,	7,772

The fact that it has developed to this point is in large measure due to the adaptability of the Japanese people to this special type of industry, an abundant supply of labour, favourable climatic conditions, brisk domestic consumption of cotton yarn, the propinquity to large foreign markets, the constant efforts of manufacturers, and the protective policy of the Government. The Government and private firms have co-operated in furthering technical improvement by the rationalization of production by large mills and by production control and improvement in the quality of products through the organization into industrial guilds of the smaller mills. There were, in 1932, 127 such guilds throughout the country. This development and co-operation enable Japanese mills to supply the world's markets with goods of excellent quality at reasonable prices.

According to the new factory law of 1926, the employment of

1 Figures given here and those following are for mills only which employ more than 5 operatives, unless otherwise stated.

2 For a detailed description of silk see Chapter XIV.

Digitized by Google

minors and women during night hours was prohibited after July 1, 1929. As a result, workers are now divided into two shifts, each of 8½ hours, which means a 15 per cent. reduction in the operating hours as compared with the old system. In order to make good this loss the cotton spinning factories have been trying to increase efficiency in other ways. Two methods have been adopted. One is to improve the technical factors of operation, and the other is to improve the workers by giving them better training, and the result has been larger individual output and the replacing of lower by higher quality goods.

Statistics The number of operatives, mills, etc. for all kinds of textile industry in 1933 show an increase over those of 1932, indicating that the industry as a whole was very prosperous in that year. The following table shows these figures:

NUMBERS OF OPERATIVES, MILLS, ETC. IN TEXTILE INDUSTRY IN 1933 AS COMPARED WITH THOSE IN 1932

Kind of industry	No. of mills		No. of mills using motors		No. of officials		No. of technicians	
	1932	1933	1932	1933	1932	1933	1932	1933

Cotton Spinning

Recent Development

The Year 1934 Business result of mills belonging to the Japan Spinners' Association for 1934 realized some improvements over the year before. Fixed assets, net profit, dividend, reserves, and balance carried forward showed better results than for 1933. Results of member companies belonging to the Association follow:

	First term 1933	Second term 1933	First term 1934	Second term 1934
Paid capitalization	385,675	391,899	399,638	424,874
Reserves	243,549	247,875	253,486	264,537
Funded debt	128,770	124,934	116,268	131,747
Fixed assets	561,004	555,556	565,397	571,491
Applied to depreciation for term	17,416	24,282	20,325	24,858
Brought forward	30,446	45,500	36,853	53,936
Net profit or loss	30,009	32,673	35,948	37,065
Dividend	19,840	21,047	24,621	25,682
Applied to reserves	5,314	6,200	6,621	6,518
Carried forward	35,301	50,926	41,561	58,800
Average dividend	10.6	10.8	12.7	12.2

Digitized by Google

The lowest dividend rate in recent years was 7.6 per cent. for the second half of 1929. The rate was 8.4 per cent. for the first half, 1931; 9.4 per cent. for the second half, 1931; 10 per cent. for the second half, 1932; 10.6 per cent. for the first half, 1933; and 10.8 per cent. for the second half, 1933.

Spindles, Looms, Capitalization During the last nine years Japan witnessed an increase of 3,446,000 spindles. This means an average yearly increase of 382,000 spindles and a monthly gain of 32,000 spindles. The number of spindles and looms for the last nine years and the capitalization and equipment for the past twenty-one years follow:

	Spindles (Rings)	Looms
1926	5,644,772	77,043
1927	6,079,272	78,352
1928	6,425,500	81,209
1929	6,795,502	77,898
1930	7,171,527	79,466
1931	7,498,152	77,782
1932	7,929,530	79,277
1933	8,608,608	86,343
1934	9,495,254	91,146

COTTON SPINNING PROGRESS

Operatives The year 1933 saw the first expansion in the number of workers employed in weaving for some time. With more inexperienced hands on the job, the figure on operatives per 1,000 looms (including power house and other workers) rose slightly. The tendency to replace with women exaggerated this tendency. But the figure again declined in 1934.

OPERATIVES PER 1,000 LOOMS

	Male	Female	Total
1908	158.1	948.2	1,102.2
1913	142.0	959.4	1,101.4

1934	65.8	385.6	451.4

Import of Cotton

Since Japan practically does not produce any cotton, almost the whole of her requirements of ginned cotton is imported from abroad, which increases every year in quantity. The total imports in 1934 amounted to 13,525,151,000 kin, of which 6,486,727,000 kin or 47.9 per cent. was from the U. S. A., 5,792,383,000 kin or 42.7 per cent. from British India, 549,550,000 kin or 4.1 per cent. from Egypt, 330,644,000 kin or 2.4 per cent. from China and the balance from other countries. The Japanese boycotting of 1933 to purchase Indian cottons, owing to the Indian tariff action against Japanese goods, explained elsewhere in this chapter, which reduced imports from India sharply in the year, did not last long. The import from India rose once more to 42.7 per cent., while the American share fell again to 47.9 per cent. from 60 per cent. This decline of import from America was not due to a slump in price in this market, but to the more favourable price position of Indian cotton, coupled with the Indo-Japanese Trade Agreement. Under this agreement, Japan is required to purchase 1,000,000 bales a year from India, in return for which she is allowed to sell 325,000,000 yards of piecegoods in India. She may sell 1,500,000 yards more for every 10,000 bales over 1,500,000 bales of raw cotton she buys, until a total of 400,000,000 yards is reached. Purchase of 1,931,000 400-pound bales in the calendar year of 1934 gave Japan the right to sell roughly 385,000,000 yards of piecegoods in the piecegoods year which ended March, 1935.

Yarn Exports

Whether Japan has a favourable or unfavourable trade balance in cotton yarn depends not only upon prices, but also upon conditions prevailing in China. If the Chinese are boycotting Japan, they first direct their attention to the Japanese-owned mills in Shanghai and elsewhere. Such mills, when they cannot sell their products in China, send their stocks to Japan proper. Thus, the seesaw movement in Japanese yarn imports, shown in the following table, becomes understandable in the light of political as well as financial events.

Cotton Textiles

It may be safely said that to-day the Japanese cotton spinning industry is practically occupied in the manufacture of cotton textiles, and, therefore, the rise or fall of the industry depends on the growth or decline in the export of these textiles.

There are about 60 members in the Japan Cotton Spinners' Association. This organization also reports on the yarn output of 10 outsiders, which among them have but 11 mills and a paid capitalization of only ¥10,400,000. But these are all spinners, some of whom also weave. It must be remembered, however, that less than a third of cotton yarn consumed in this country is taken by the spinning mills in their cloth production. The balance goes to hundreds of little weaving plants, scattered all over the country. Some of them are one-loom sheds, worked by a family as household industry. The following table shows the output of cotton textiles by the member companies of the Japan Cotton Spinners' Association.

VALUE OF COTTON CLOTH PRODUCTION

(Prepared by the Ministry of Commerce and Industry)

Year	Production in value (in ¥1,000)
1924	745,828
1925	774,372
1926	743,315
1927	725,419
1928	784,634
1929	786,534
1930	498,021
1931	423,023
1932	531,915
1933	704,893

Note: Figures include production by small factories which employ less than 5 persons.

Apparently gains in efficiency have gone just about as far as they can go under present conditions and with present machinery. Conditions at present are not entirely conducive to more efficient operation, for most of the big companies are making profits and are not watching the fine details as carefully as they were forced to do not so long ago. However, there have been vast gains in the last few years and most of these are being retained.

Import of Cotton Textiles Until 1931 Japan used to buy a considerable amount of cotton cloth from abroad. This was due largely to the fact that mills in this country concentrated principally on weaves intended for the export market and did not make the finer grades of cloth. With the geographical as well as volume expansion of exports, however, markets for the fine weaves began to open up and Japan commenced to make them. The negligible size of the 1934 imports shown in the following table indicates that the market here has been all but wiped out.

Year	Volume (in 1,000 sq. yds.)	Amount (in ¥1,000)
1930	9,701	4,999
1931	11,630	4,375
1932	10,110	4,130
1933	9,077	2,754
1934	1,392	947

Export of Cotton Textiles Taking advantage of the decline in the yen exchange, the export trade manifested great activities since 1932. In particular, the export of cotton tissue has made tremendous gains in 1933 and 1934. Their chief markets are British India, Dutch East Indies, Egypt, Kwantung Peninsula, China, etc. The amount of cotton cloths exported in 1931 was 1,413,825,000 sq. yards valued at ¥198,732,000, which increased to 2,577,237,000 sq. yards valued at ¥492,351,000 in 1934, showing gains of 1,163,412,000 sq. yards or 82 per cent. in quantity and ¥293,619,000 or 148 per cent. in value.

Export of cloths to British-India has been placed under control by the Indo-Japanese Trade Agreement. The total for 1934 (including Ceylon, which is outside the pact) was about the same as that for 1933, but, since Japan shipped so much more cloths to the world, the percentage of exports to India to the total exports was lower.

Export to China The Chinese market has been contracting. There have been two reasons for this. One is the growing ability of the mills in China to supply the needs of the country and at cheaper prices than the Japanese. Most of such mills are run by the Japanese and British. The other reason is the boycott movement, which has never been cut down completely. Back in 1928 China was Japan's outstanding customer for cloth, taking 44.2 per cent. of total exports. Last year China proper and Hongkong took but 3.8 per cent.

CLOTH EXPORTS TO CHINA (1)

	All Exports	Exports to China	
	(in sq. yards)		%
1928	1,418,798,000	653,685,000	44.2
1929	1,790,650,000	671,346,000	37.5
1930	1,571,825,000	587,782,000	37.5
1931	1,413,780,000	340,829,000	24.1
1932	2,031,722,000	193,623,000	9.5
1933	2,090,280,000	141,940,000	6.8
1934	2,577,237,000	95,735,000	3.8

If the former parts of China are added together, that is to say, if China, Hongkong, Manchoukuo and the Kwantung Leased Territory are totalled, the figure for 1934 amounts to 349,694,000 sq. yards or 13½ of the all-Japan total. The decline in the Chinese market is actual, not merely an optical illusion caused by the independence of Manchoukuo.

Indo-Japanese Trade Conference

The Indo-Japanese Trade Conference which was held in Simla and New Delhi during the second half of 1933 came to a successful end on January 5, 1934. The trade dispute between the two countries started following the action of the Indian Government in repudiating the old trade convention in April of 1933. The situation became aggravated in June, when India increased the tariff against Japanese goods to 75 per cent. The action of the Indian Government was met by Japanese businessmen, who declared a boycott against Indian raw cotton. To remedy the situation, the Indo-Japanese Trade Conference was called in Simla in September. The negotiations for a time made almost no progress, and it was reported on more than one occasion that there was no prospect for a successful conclusion. Finally, both sides showed patience and this saved the conference. The new treaty had yet to be initiated, but a portion of it took effect on and after January 8, 1934.

The Agreement The agreement provides six features. First, most-favoured-nation treatment will be accorded to goods of the two countries. Second, there will be a lowering of tariff on Japanese cotton piecegoods imported by India. Third, a quota will be instituted for Japanese cotton cloth goods imported by India, and the quota will be related to the purchase of Indian raw cotton by Japan. Fourth, the Japanese boy-

Digitized by Google

cott of Indian cotton be discontinued. Fifth, measures will be adopted to meet fluctuations in exchange. Sixth, the two countries are to meet for discussion of measures to deal with customs duties which may be found to affect their interests. Meanwhile, three points which are to figure in the new treaty went into effect forthwith: first, the Japanese boycott will be discontinued; second, the Indian tariff on Japanese cotton piecegoods will be lowered from 75 per cent. ad valorem to 50 per cent., to 6.75 annas per pound, other goods from 75 per cent. to 50 per cent., or 5¼ annas per pound and others lowered to 50 per cent., and, third, the quota for Japanese goods agreed on will be enforced.

What It Means The new agreement is far from favourable to Japan. This country has made sacrifices it ought not to have made under ordinary circumstances. It did so because it did not want the conference to end in a failure, thus placing Japan and India in non-treaty relations. There was an impression in India that the Japanese boycott of Indian raw cotton was intended as a threat. But the new treaty was the result of mutual accommodation by the two countries. The lowering of the Indian tariff on Japanese cotton piecegoods benefits both the Japanese spinners and the Indian consuming public. As for the limit imposed on Japanese cotton goods, which is 400,000,000 square yards, Japan finds it difficult to make full use of it, if India levies specific duties. The percentage allowed to grey cloth is 58 per cent. of the quota. This is not satisfactory to the Japanese manufacturers, who will have difficulty in exporting that amount, especially in view of the progress being made by the Indian cotton mills in this line of cloth. Lancashire interests are much pleased with the new agreement. There is ample room for them to expand their business in bleached and other high-grade cotton goods, of which the percentage allotted to Japan under the new arrangement is very low. Some of the sacrifices made by the Japanese delegation at New Delhi were with an eye to alleviating Indian sentiment in regard to the competition of Japanese general merchandise in the Indian market. The Indian Government, however, suddenly announced tariff revision on about 20 kinds of Japanese merchandise on December 23. For example, the tariff on rayon mixtures was raised to 50 per cent. ad valorem, or 2.3 annas per square yard, from 35 per cent., or 2.3 annas; cotton fents to 75 per cent. ad valorem from 25 per cent.; and others.

Cotton cloth exported from Japan to India for 1933 totalled 640,000,000 yards. At first, Japanese traders planned to export about 1,280,000,000 yards there for the same year, but this was not done, due to the abrogation of Indo-Japanese trade convention and the imposition of a high tariff of 75 per cent. on Japanese cotton piecegoods. The Japanese delegation stood on the basis of buying 1,000,000 bales of Indian cotton in return for selling 325,000,000 yards of Japanese cloth. This was a source of dissatisfaction to Japanese traders, because of the reason that the fundamental terms of 325,000,000 yards and 1,000,000 bales can be developed by a sliding scale to that when Japan exports 400,000,000 yards to India, this country has to buy 1,500,000 bales of raw cotton.

The fact that Japan is willing to buy yearly 1,500,000 bales of Indian raw cotton does not necessarily prejudice her future purchase of American raw cotton. The figure of 1,500,000 bales was computed on the basis of Japan's actual importation of Indian cotton in past years. The

Digitized by Google

average, for example, for the last 10 years' importation amounts to 1,565,000 bales, and that for the last five years to 1,419,000 bales both figures differing but very slightly from the agreed quota of 1,500,000 bales. Therefore the purchase by Japan of Indian cotton to the full quota does not in any substantial manner affect the position of American cotton. Furthermore, the volume of consumption of American cotton in Japan is steadily expanding, and this tendency seems to be persistent. This is easily understandable, as in consequence of the advance in the technique of Japanese industry her staple cotton piecegoods products are gradually shifting from coarser to finer fabric, for which American cotton is better suited as raw material than Indian. If there is anything that prevents Japanese spinners from using more extensively American cotton, it is its comparatively high price. The price is, after all, the predominant factor of consideration for the spinners in making their choice of cotton, because it follows that if American cotton be reasonably cheap it can not only maintain the present market in Japan but also develop more exports to this country. According to the latest available statistics, the amount of American cotton consumed by Japanese spinners was as follows in comparison with cotton of other countries :

Countries of supply	In 100 kin	Percentage
U.S.A.	6,487,000	47.9
India	5,792,000	42.7
Egypt	550,000	4.1
Other countries	696,000	5.3

For the last 12 years, the importation of Indian and American cotton was :

Year	Indian	American
	(In bales)	
1925	6,154,475	3,799,504
1926	5,865,282	4,522,373
1927	4,992,005	6,359,658
1928	4,603,928	3,871,600
1929	—	4,485,146
1930	5,136,468	3,883,488
1931	4,725,444	5,321,022
1932	2,739,842	9,101,688
1933 in 100 kin	3,977,000	7,435,000
1934 „	5,792,000	6,487,000

In the light of the Indo-Japanese commercial agreement concluded at New Delhi, the Japan Spinners' Association on January 7 made formal announcement of the termination of the boycott against Indian cotton instituted by the Osaka industrialists early in the summer of 1933.

Anglo-Japanese Textile Trade Conference

The Anglo-Japanese Textile Trade Conference was held on February 14, 1934, in London. After the subsequent six meetings it came to rupture on March 14. The Japanese delegation consisted of Mr. Gota Miyaké and four others representing cotton traders, Mr. Katsunosuké Shimada, representing rayon traders, and Mr. Shinjiro Matsuyama, commercial counsellor of the Japanese Embassy in London, observer. The British side was represented by Sir Thomas Barlow, heading Lancashire spinners, and several others. The cause of rupture was in the one-sided proposal made by the British delegates to restrict the export amount of Japanese cotton and rayon piecegoods alone, without any restriction on British goods. That country also demanded the export amount of Japanese goods be based on the 1931 exports, which were 300,000,000 yards less than the British exports, while Japanese exports were 57,000,000 yards more than the British goods for 1933. The British

Digitized by Google

side further asked that a quota on Japanese goods shall be extended to all British territories and third countries.

Japan's Statement Following the breakdown of the Anglo-Japanese trade conference, the Japanese delegation made the following statement: "The Anglo-Japanese trade conference has now been abandoned, with the sixth session marking the end, as the claims on both sides are too incompatible. The Japanese delegation since their arrival in London last September have endeavoured very earnestly to let better understanding of the Japanese economic and social situation prevail among the people here and drive home in the mind of Lancashire the fairness of the effort of the Japanese industry to advance on world markets, convinced that if we could secure a scheme whereby needless competition between Britain and Japan might be avoided and mutual prosperity assured, nothing could be more hoped for, for the sake of world commerce. At the very outset of the formal conference, however, the Lancashire delegation proposed a unilateral restriction on Japanese exports without any parallel action on the part of Britain, on the ground that Japan's cotton textile and rayon textile advance on world markets is harmful to the stability of world commerce. We tried hard to explain that such a demand is unfair and emphasized that Japan merits no reproach for her trade advances, for they are founded on thoroughly fair operations, hoping that some co-operative measure could be adopted to relieve the difficulties of competition. The Japanese delegation declared that in respect to trade with a third nation the negotiations should be direct and that it would not be advisable to have Britain participate in such negotiations, pointing out that Japan had in fact started such negotiations with a number of other countries. In brief, we proposed that a third nation or Dominions with autonomous tariff rights should be excluded from the sphere of discussion and only Britain and her territories included in any agreement to emerge from the conference. The British delegation proved adamant, however, declaring that if Japan refuses to accept their proposal Britain would be compelled to meet Japanese competition by such political measures as high tariffs and import restrictions, and, moreover, it would result in the industrialists of other European nations entering into a combination against Japanese goods, thus isolating Japan to her everlasting disadvantage. They urged us to accept their proposal without any anxiety, as by means of a pool are commonly in practice. Seeing that the talks between the industrialists were in this way not likely to come to an agreement, the British Government took a hand and urged the Lancashire delegation to make a new proposal. In this proposal, they claimed that Japan must reduce her exports to the world level because the figures for the world's cotton textile exports in 1929 were 8,000,000,000 square yards but last year were reduced to 5,000,000,000 sq. yards, whereas Japanese exports alone showed an increase. They declared that since considerable decrease had taken place in their exports they would fix their level on the assumption of some increase afterwards and if trade revives and an increase develops Japan will get a share. The decrease in Japanese exports, they said, should be effected with reference to five continental areas. Now this proposal is in substance the same as their previous proposal with only an alteration in the manner of explanation, demand-

Digitized by Google

ing just as before that Japanese exports should be restricted unilaterally and Japan abandon her markets and differing entirely in nature from any pool agreement.

"It is obvious that Japan could not agree to any such scheme, since nothing could be really effected with regard to a third nation market or markets of the Dominions with autonomous tariff rights nor could anything be done about competition with the industrialists of other nations by any agreement with Britain. We have sojourned for six months or more in London, and throughout this period we have done our best to continue the negotiations in the spirit of co-operation. We are surprised that Lancashire should demand of us abandonment of the main part of our markets overseas for our cotton textiles in order that pressure on Lancashire should be lifted. It is not without misgivings as to the situation resulting from the breakdown of this conference that we express our regrets that we could not avert the collapse in spite of the fact that we did our best."

JAPAN'S EXPORTS OF COTTON YARNS AND COTTON CLOTHS TO INDIA

(In ¥1,000)

Japan-Dutch East Indian Trade Conference

Trade Relation Japanese-Dutch trade relations have been maintained since the Tokugawa era. Japan for many years bought more from Holland than it sold to it, but about 10 years ago the balance shifted, Japan selling more than it bought. In the past few years, Japanese exports to the Dutch East Indies have gained tremendously, and Holland, including its colonies, is second only to Great Britain in importance among the European Powers as an outlet for Japan's commodities. Exports to Holland proper, however, total little more than ¥12,000,000 a year, and imports into Japan from Holland proper are trifling. The trade at issue is with the Dutch East Indies and Dutch West Indies, which has of late been very prosperous for Japan. These Dutch possessions bought from Japan goods worth ¥63,540,000 in 1921; ¥100,250,000 in 1932, and ¥121,910,000 in the first 10 months of 1933. They constitute Japan's fourth most important market, and since 1932 they have been taking more from this country than from Holland itself, a situation that has naturally led the Dutch industrialists to campaign for restrictions against Japanese commodities. The low yen exchange rate since replacement of the gold embargo, the efforts of the Japanese manufacturers to cultivate new markets as a result of the anti-Japanese movement, and the ingenuity of Japanese traders account for growth of trade with the Dutch Indies especially as the economic depression in the islands has created a demand for cheaper goods, which Japan alone has been able to supply. Japanese commodities meet the fancy of consumers and are therefore popular. The market prices of such staple Dutch Indian products as sugar, rubber, copra, tobacco, petroleum and tin have declined heavily in recent years because of the world-wide depression. During 1933, the Dutch Indian Government had a budgetary deficit of 14,000,000 guilders, and the 1934 deficit is likely to be even greater. By encouraging thrift and economy among the people, the authorities have cut down their purchasing power, which has turned them to low-priced Japanese goods. Japanese commodities fill the demands of some 60,000,000 inhabitants of the islands. Dr. Haruichi Nagaoka, former Ambassador in Paris, was named Japan's chief delegate at the Batavia Conference to be held about May, being assisted by the Japanese Consul-General there.

The conference adjourned indefinitely without any result on December 21, 1934.

Trade Regulations The Dutch East Indian Government issued regulations providing for restricting import cotton piecegoods from Japan on February 28, 1934, effective from March 1. The term of enforcement is 10 months. The restrictions are as follows:

		Maximum import amount
1.	Cambrics	75,000,000 yards
2.	Cambrics, shirtings, elephant, etc.	210,000 „
3.	Shirtings and long cloth	20,000,000 „
		Maximum import amount
4.	Drills	4,500,000 yards
5.	Jeans and twills	8,000,000
6.	Satin, Flannel, Bleached cloth other than already mentioned	3,000,000

Cambrics, shirtings and bleached jeans are most important bleached cotton cloth exports from Japan. The import restrictions were based on the import amount into the Dutch

Digitized by Google

East Indies for 1932. Japanese bleached cloth exported to the Dutch East Indies for the last five years follows:

	Total Imports from Japan	Cambrics for Java	Shirtings for Java
	(In 1,000 yards)		
1929	9,592 (4.9%)	4,367 (3.6%)	1,339 (4.7%)
1930	13,098 (7.8)	7,439 (7.2)	941 (3.8)
1931	21,594 (15.8)	12,365 (13.9)	2,686 (15.9)
1932	53,667 (37.8)	31,282 (35.8)	8,306 (49.2)
1933	126,062 (77.5)	82,327 (82.3)	15,835 (85.3)

(For 1934 trade relations between Japan and Dutch East Indies see Chapter XI.)

Japanese Mills in China

Beginning of Enterprise It was in 1902 that the Japanese commenced cotton spinning and weaving enterprises in China, when the Shanghai Cotton Spinning and Weaving Co., Ltd. was established to purchase two American mills, the Hsieh Lung and the Hsing Chin. The second company to be promoted was the Naigai Men Kabushiki Kaisha (The Naigai Cotton Co., Ltd.) established also in Shanghai, in 1909.

The outbreak of the World War and the subsequent boom brought enormous profits to these Japanese mills in China. This prosperity was then further advanced by the abrupt rise of the price of commodities and wages in Japan during and after the War, and also, by the increase of customs duties in China.

At the end of the World War, there were 3 Japanese cotton spinning and weaving companies in China, viz., the Shanghai, the Naigai, and the Nikka. These companies operated 10 mills, of which the combined equipment stood at about 400,000 spindles.

Its Expansion A wholesale expansion of the Japanese cotton enterprises in China then took place during 1924 and 1925. Consequently, there were, at the end of 1926, 15 Japanese companies with an aggregate of 1,257,000 spindles and 6,690 looms. Their total investments were then valued at ¥200,000,000.

The Chinese cotton spinning and weaving enterprises also made remarkable progress. Their combined equipment amounted to 1,770,000 spindles in 1926. The enterprises run by those other than the Chinese and the Japanese, however, remained inactive, those of the British, who were the pioneers of the foreign cotton industry in China, showed hardly any progress, while the German and American companies went out of business.

Owing to the high price of silver, the deflation policy of the Government and to the lower purchasing power of the people caused by the crisis in agricultural districts, the industry in 1934 in China was depressed to such an extent as it has never experienced before. The industry was depressed because of the low price of cotton goods, while the raw materials were bought at a higher price. Production by the Chinese mills was only 75 per cent. of capacity. On the other hand, the Japanese mills were able to run to the extent of 90 per cent. of full capacity in spite of the increased tax on cotton yarn and duty on imported cottons. In view of the Chinese boycotting against Japanese goods, Japanese mills made way into North China and Manchoukuo markets, in which they were successful. The facilities of the Japanese textile industry at the end of June, 1934, in Shanghai, Tsingtao, Hankow, Kwantung Peninsula and Manchoukuo were as follows:

Digitized by Google

NO. OF SPINDLES, THROWN YARN SPINDLES, LOOMS IN 1934

	No. of spindles		No. of spindles for thrown yarn		No. of looms	
	1934	inc. over 1933	1934	inc. over 1933	1934	inc. over 1933
Shanghai	1,351,868	61,332	284,152	8,624	13,572	456
Tsingtao	379,553	11,772	17,680	880	4,934	64
Hankow, Kwantung Peninsula, Manchoukuo	148,896	8,400	2,820	720	805	—
Total	1,880,316	81,504	304,652	5,224	19,311	520

The following table shows comparative figures of cotton yarns and textiles in 1933 and 1934 produced by Japanese, Chinese and British mills in China. While Chinese and British mills did not increase production, Japanese mills alone were able to make gains in 1934 over 1933 :

PRODUCTION OF COTTON YARNS AND TEXTILES

	Production of cotton yarns in 1,000 bales		Production of cotton textiles in 1,000 hiki*	
	1934	1933	1934	1933
Chinese mills	1,617	1,665	9,040	9,548
British „	80	92	1,840	1,850
Japanese „	576	576	12,585	8,724
Total	2,273	2,333	23,465	20,122

* One hiki is about 70 shaku.

Investment of capital by Japanese spinning mills there at the end of 1933 totalled ¥299,000,000, that by Chinese mills 38,390,000 taels and 96,710,000 yuan and that by British mills 4,570,000 taels. From various points, Japanese mills now occupy the predominant position. While 11 Chinese mills were closed in Shanghai between April and August of 1933, Japanese mills kept increasing their productive equipment during the same period. Their business activity was especially pronounced after August. The alleviation of the anti-Japanese situation was largely responsible for this.

The following table gives the total imports into China of cotton yarn, the imports into China from Japan, and the Chinese exports of Chinese yarn during the 13 years ending 1933 : (Unit : bales, Hongkong and Kwantung province are excluded.)

Year	Total imports	Imports from Japan	Chinese exports
1919	470,209	191,899	22,401

Silk Textile Industry

Silk Weaving Districts As early as the days of the Emperor Suijin, about 1,960 years ago, weaving was already carried on, on a fairly large scale, under encouragement of the Imperial Court. During the Yedo Age the weaving industry made marked development as one of the most important domestic industries. The Ryomo district has been known as a very prosperous weaving centre for centuries. This district is in Gumma and Tochigi prefectures and includes great weaving centres such as Ashikaga, Kiryu, Isézaki, Sano and Tatebayashi. The district may be likened to Paterson, New Jersey, U. S. A. The main products of the Ryomo weaving district are silk textiles for domestic use.

Another important weaving district is Fukui, followed by Kyoto, Ishikawa and Tokyo in the order named. Among silk weaves habutaé, taffetas, poplin, chiffon, pongee, fuji silk, crêpe, etc. are well-known abroad. In addition to these, however, there are many other varieties, which are used by the Japanese at home. The width of these weaves are generally narrow. To give the names of some of them : omeshi, ro, sha, meisen, nishijin, etc. These narrow weaves are almost solely manufactured for domestic consumption.

The Industry in 1934 Continued prosperity featured the silk weaving industry in Japan for 1934. The low exchange, low price of silk and low wages account for this. Exports again increased in 1934. Though British-India and some countries in Europe tried to bar import of the Japanese silk weaves, the depreciation in currency enabled Japan to push her export in spite of that, and her export of silk weaves experienced an unprecedented boom.

Owing to the activities of the munitions industries, the purchasing power of consumers increased at home and the sales of silk weaves were good in the domestic market also, producers reaping profits all through the year.

Production of Silk Weaves Owing to the increase of consumption both at home and abroad the production showed great gains. Except Kyoto weavers, most weavers in other districts turned to weaves intended for export, so that those engaged in weaving textiles intended for domestic consumption were also kept busy and prosperous. Production of crêpes amounted to 6,123,000 units and showed an increase of 1,149,000 units over 1933 ; habutaé totalled 1,125,000 units making a gain of 192,000 units ; and fuji silk 1,434,000 with a gain of 69,000 units. Other weaves which are mainly consumed at home, such as omeshi, nishijin, meisen, etc. also showed increases in production. The industry as a whole profited through the low price of silk. Production of silk weaves since 1926 follows :

Export of Silk Weaves The production of silk weaves for export in 1934 amounted to 5,280,200 units and showed an increase of 748,000 units over 1933. During the first half of the year the demand in Europe, British India, the South Sea Islands, Australia, North and South America, and Africa was very strong, though it was reduced in the latter half owing to the increased tariff in various countries. Value of crêpe production increased by ¥9,358,000 over 1933, fuji silk by ¥1,399,000 and habutaé by ¥1,492,000. Exports during the last four years follow :

Rayon

Rise of Rayon Industry

In 1926, the total production of rayon yarn in Japan amounted to only 5,000,000 lbs. while in 1932 it increased to more than 64,000,000 lbs. The 1933 output is estimated at 158,790,000 lbs., thus making Japan one of the chief producing countries in the world. Only a few of the existing rayon manufacturing companies, such as Teikoku and Asahi, were established before 1926. Since then, quite a number of new companies have been added, including Nihon, Tokyo, Showa and Kurashiki.

Causes of Development What are the causes of such a rapid rise of this new industry in Japan ? First of all, rayon came to fill a long-felt want. Japanese dress styles change very rapidly. Special designs and different colour schemes are in vogue each season. The obi, or sash, is the decorative centre of the native Japanese costume, and women want variety in them. The natsuobi, or the sash for summer wear, is worn for but a few weeks, and the next year its colour may be out of fashion. Under these circumstances the comparatively low price of rayon is especially tempting, for it enables women to keep close to the styles without unduly straining their means.

Rayon was at first regarded with much distrust, but it has since proved thoroughly serviceable. The manufacturers have been making vigorous efforts to improve the quality of the yarn. Some makers are now turning out multifilament yarns, which consist of a larger number of finer filaments compared with ordinary yarn of the same size. Multifilament yarns are more supple than ordinary ones and when woven the cloth is practically free from the creases which are unavoidable in textiles made of ordinary yarn. A further innovation is that dull lustre yarns are being made in some factories.

The public has been educated in

Digitized by Google

how to handle goods made of rayon —how to wash them, and so forth, and the ways in which rayon is being used have considerably increased during recent years. In 1907, it appears that rayon was used almost exclusively for making ribbons. In 1920, weavers commenced adopting rayon for necktie materials. In 1921, they started using it in women's obi, a particular line which has since much developed.

It is hardly necessary to extol the superior quality of natural silk, its beauty, soft feel, and durability, but sometimes, it is more expensive than one can afford, and a trade in mixed rayon and silk fabrics, which are obtainable at reasonably low prices, has arisen. Such textiles are finding more and more favour with the public, and both silk and rayon are being given more opportunities of use. This weaving in silk and rayon mixture has made a unique development in Japan, and has attracted world-wide interest.

The mixed fabrics enable dyers to produce a pleasing effect by cross-dyeing, that is, by applying at separate times the dye that affects silk only and the one that affects rayon only. Such stuffs are increasingly popular for making into kimono. Likewise, cotton and rayon mixtures are being woven with excellent results. The same principle has already been applied to several other fibres, such as hemp and wool, with success.

The Output Observation of the development of the rayon industry in Japan discloses that, while in 1928 the output was only 4.5 per cent. of the world output, in 1931, it represented over 10 per cent., with the result that, in point of production of rayon, Japan now ranks second to the United States and is on a par with Great Britain, Italy and Germany.

This rapid development is traceable primarily to the cheapness of fibrous material in this country, but partly to the improvement in the quality of the product, the progress of technical skill and the extension of the use of rayon during the last few years and, moreover, to the extensive markets that Japanese products enjoy in China, India, the Dutch East Indies, the Straits Settlements and the Philippines.

Production The table below shows the development of the production of rayon yarn and its exports and imports during the years 1923-34.

RAYON YARN

(in pounds)

Year	Production	Imports	Exports	Real Supply
1923	780,000	1,006,609	—*	1,786,609
1924	1,368,000	895,655	—*	2,263,655
1925	3,200,000	824,285	—*	4,024,285
1926	5,000,000	3,288,149	—*	8,288,149

Japan's Rayon Exports

During 1933 Japan's export of rayon tissues lost ground in British India and the United States but steady advances elsewhere allowed the country to close the year with a strong gain. In 1931 exports were worth only ¥39,712,933; in 1932 they were ¥60,539,940; in 1933 they were ¥77,381,765; and in 1934 they were ¥113,484,235.

Exports of rayon yarn to China and Hongkong showed a startling contraction last year but sales to Manchoukuo and the Kwantung Leased Territory expanded tremendously, more than making good the loss. There was a large loss, as well, in shipments to Australia and New Zealand.

EXPORTS OF RAYON FABRICS

(In 1,000 yards)

	1930	1931	1932	1933	1934

Rayon Industry in 1933 and 1934

In 1933 Japan became the second largest producer of rayon in the world, preceded only by the United States. In 1934 the American lead was reduced and this year, if expansion plans come to fruition, Japan will become the world's most important producer of the fibre. Gains

Digitized by Google

in production made by Japan in the past several years have been most spectacular as the table given above shows.

In 1933 Japan produced 90,428,000 pounds of rayon. In 1934, the total was 137,795,000 lbs. for the companies which are members of the Association of Rayon Manufacturers and 21,000,000 lbs. for outsiders, making 158,795,000 lbs. In the same year the United States was turning out 187,670,000 pounds.

World production of rayon yarn in 1934 is estimated at about 750,000,000 lbs., gaining 90,000,000 lbs. or 14 per cent. over the 1933 total. Therefore, the production in the same year by Japan of 158,795,200 lbs. means that she produced over 21 per cent. of the world's total production. Her 1933 production totalling 90,428,000 lbs. was 14.3 per cent. of the world's total production, which was 631,565,000 lbs. The relation of demand and supply of rayon for 1934, as compared with 1933, follows :

	1933		1934	
	(In case of 100 lbs.)			
Production of yarn	904,285		1,587,952	
Yarn imported	5,014		690	
Total supply	909,299		1,588,642	
Yarn exported	88,635		221,825	
Textiles exported in pounds	429,330		570,330	
Overseas consumption	517,965	(54%)	792,155	(49.8%)
Domestic consumption	391,334	(46%)	798,487	(50.2%)

The remarkable development of rayon industry in Japan must be attributed to the fact that the cost of raw material, though imported at present, occupies a rather small percentage of the total cost of production, while in making cotton yarn, Japan must import cotton which occupies a major portion of production cost. If it becomes possible to produce rayon pulp in Japan in large quantities as it is being planned, the situation will further improve. (As to rayon pulp see Chapter XXII, Paper, Rayon Pulp.) The production cost of 120 denier medium quality at present ranges between ¥50 and ¥60 per 100 pounds, generally near the lower figure, which is below the cost of the corresponding quality of cotton yarn (44s).

It should be noted that, in making 44s, material accounts for 80 per cent. of the production cost. This is fixed and immovable and cotton yarn producers must squeeze the remaining 20 per cent. if they are to reduce production costs. In making the corresponding grade of rayon, pulp accounts for only 22 to 23 per cent. of the production cost. Chemicals and electric power are classed as "semi-materials" costs but rayon producers here have managed to cut these very appreciably, building their own chemical and power plants. Labour costs have also given Japanese rayon production tremendous profit margins.

Woollen Industry

Introduction

The establishment of a Government woollen textile mill in Senju, Tokyo, in 1876, was the origin of this industry in Japan. Many private companies were organized after the Sino-Japanese and Russo-Japanese Wars, but owing to the pressure of foreign competition only a few

Digitized by Google

companies were able to survive. By the World War the industry was given a further good opportunity for trial at development, an opportunity that was not neglected, and which turned out more successful than previous attempts, as a very big demand for woollen goods was created.

The production of woollen goods in Japan is carried out by two classes of manufacturers. The first are the large scale producers, all joint-stock companies, who carry through the whole process of spinning the yarns, weaving them on power looms and dyeing them. The other class is that of the small producers who buy yarns from others and weave by hand looms. There are about 30 companies which belong to the former class, while there are numerous weavers who belong to the latter class and who produce considerable quantities of serge, muslin, etc.

Woollen textiles are manufactured from wools mostly imported from Australia. Japan does not produce any wool herself. Formerly, in addition to greasy wools, tops were imported in large quantities, but, as the facilities for preparing tops from greasy wools have been greatly improved, the importation of tops has recently been drastically reduced.

The Industry in 1934

Woollen industry is one of beneficiaries of the depreciation of the yen currency. While almost every country, with the exception of Great Britain, has been recording a decrease in production in recent years, the Japanese woollen industry alone has more than doubled its output since 1928. Japan to-day stands second only to Great Britain as a consumer of raw wool and is the fifth in the list of exporting countries.

The prosperity of the industry was, however, at its height in 1933. Great profits in 1932 resulted in the usual rush of outsiders to get a share of the business. New mills were set up, and the old mills expanded their facilities. Owing to the impoverished state of the farming districts, which have practically no purchasing power, domestic consumption did not increase. The result was shown in the increase of stocks, which, in June, 1934, totalled as much as 8,967,000 lbs. Though this unhappy condition was relieved partly by the increase in export, the large companies had to resort to the curtailment of production at 48 per cent. only to profit the outsiders. The situation is reflected in the import of raw wool which was reduced to 181,107,520 lbs. in 1934 as against 242,620,000 lbs. in 1933. Japan's imports of wool in the past five years are shown below:

JAPAN'S IMPORT OF RAW WOOL[1]

	Quantity in 1,000 lbs.	Value in yen
1930	115,999	73,919
1931	191,374	86,518
1932	206,858	88,321
1933	242,620	165,818
1934	184,379	187,667

Note: (1) including tops and goat and camel hair.

The output of woollen yarn and cloth showed its high water mark in 1933. The figures for 1934 show decline in quantity in every one of these as the following tables show:

PRODUCTION OF WOOLLEN YARN

	Quantity in metric tons	Value in ¥1,000
1930	17,927	59,720
1931	23,971	61,024
1932	26,367	67,230
1933	30,550	108,659
1934	28,495	126,490

1932	—	—
1933	112,503	37,350
1934	97,490	38,087

In 1934, while the sales and production of woollen goods were decreasing, the productive equipments were increased. These equipments have been expanding during the past several years as the following figures on the number of spindles, looms, machines, etc. indicate:

WOOLLEN TEXTILE MANUFACTURING FACILITIES

(at the end of the year)

	1929	1930	1931	1932	1933
Number of woollen textile factories	924	960	1,039	1,188	1,178
Number of weaving machines	21,289	21,497	22,484	26,554	26,923
Number of operatives	39,020	34,562	37,955	41,606	41,311
Number of worsted spindles[1]	446,202	443,412	563,710	581,564	667,390
Number of weaving machines[1]	9,274	8,992	9,391	10,043	9,871
Number of woollen spindles[1]	73,664	69,528	75,096	87,898	88,403

Note: 1 Only member companies of the Woollen Industrial Association.

Another noteworthy fact in connection with woollen indsutry of 1934 was the great increase in stock. Beginning with September, 1933, stocks started a movement upward which extended to June, 1934, when 8,967,000 lbs. of woolen yarn were stored in Japanese godowns. To check this distressing tendency, which was reducing prices, the Wool Industrial Association decided to curtail output of its members by 48 per cent. This was again extended to the end of the year and for the first quarter of 1935 the rate was cut to 36 per cent. These drastic measures have brought about an encouraging reduction in stocks, although the association members did not get much profit from it. The outsiders who were not members of the association were benefited by the self-sacrifice of the members.

One really encouraging factor about the Japanese industry in 1934 was the gain in exports. These went steadily upwards. Woollen cloth and serge exports were 20 times what they were in 1931, woollen yarn 8.9 times and muslin six times. Value rose to ¥33,467,000 compared with ¥1,836,000 in 1931. Principal markets were Manchoukuo, Kwantung Leased Territory, China and British India.

JAPAN'S EXPORTS OF WOOLLEN GOODS

	Yarn		Muslin		Cloth and Serge

The Japan Wool Industrial Association in co-operation with the traders interested in the trade of Japan with the Union of South Africa adopted a policy of buying possibly large South African wool, to counteract a possible increase of tariff by the Union on Japanese goods imported there in a large amount. With the understanding of the Foreign Office the Association and traders decided to buy larger wool from there. This has come to bear fruit in 1934. In 1933 Australia supplied 94.8 per cent. of Japan's wool requirement. In 1934 this percentage fell down to 84.8 per cent. This is due to Japan's attempt to expand sales to the South American countries. These all have, however, exceedingly difficult exchange regulations and the only way Japan can expand sales to them is to buy more from them. They have only a few products which Japan wants in any quantity, and raw wool is one of them. One might almost say that a drive is under way to encourage purchase of raw wool from Uruguay, Argentine and other non-Australian producers, including South Africa. Freights are against this kind of a switch, but export-import guilds are charging export fees to subsidize wool purchases from the South American suppliers. Australia still has a tremendous favourable trade balance in its trade with Japan and the Japanese scheme is to reduce it to make possible greater exports elsewhere. The following table shows the tendency of raw wool imports:

IMPORT OF RAW WOOL

Origin	1932 Quantity in 100 kin	1932 Value in ¥1,000	1933 Quantity in 100 kin	1933 Value in ¥1,000	1934 Quantity in 100 kin	1934 Value in ¥1,000
Australia	1,488,198	84,246	1,705,653	156,514	1,165,820	159,241
Argentina	8,095	481	30,918	2,427	59,392	7,552
Federation of South Africa	17,886	1,031	28,906	2,529	38,961	5,780
Chile	835	22	12,442	465	7,659	934
Great Britain	4,263	376	9,200	1,051	6,256	905
China	592	67	1,395	129	4,929	841
Kwantung Province	10	1	100	13	—	—
Others	24,613	1,335	17,228	1,064	90,343	11,701
Total	1,543,992	87,559	1,805,842	164,191	1,372,860	186,455

As regards import of woollen yarn it has steadily decreased since 1931, and its figure in 1934 has become a negligibly small one. On the other hand, export of yarn has increased almost in inverse ratio with import. Compare the two in the following table:

IMPORTS AND EXPORTS OF WOOLLEN YARN
(in 1,000 lbs.)

	Imports	Exports
1929	7,488	371
1930	8,010	617

CHAPTER XIX

MACHINERY AND ENGINEERING

Machinery

Introduction

The manufacture of machinery in Japan started after the Restoration. The progress, however, was very slow, and it was only after the Russo-Japanese War of 1904-1905 that the public began to take any real interest in investment in this kind of industry. Progress was being made before the Great War, but with the outbreak of war the situation completely changed. Prior to the War, Japan had to import large quantities of machinery, but during the World War, imports were stopped, and a great stimulus was thereby given to the home manufacture of machinery. During the war years she became able to supply not only most of her own needs, but also some of those of foreign countries. Factories for manufacturing arms and various other kinds of machinery, as well as shipbuilding-yards, were established in many parts of the country, and these profited not only financially but in the experience they acquired in skilled mechanical work of various kinds. The great boom in shipbuilding stimulated the establishment of many new works for the turning out of engines and other equipment for steamers, while the difficulty of obtaining imported machines for spinning, weaving, paper-making, etc., caused a rapid establishment of new works for their manufacture. This cutting off of imports also served to encourage the manufacture of motors, electrical machinery, automobiles and aeroplanes. With the great post-war slump, naval disarmament, general depression the world over, embargo on gold, high tariffs, and all the other ills from which industry was suffering of late years, the machinery production industry was also heavily depressed. The outbreak of trouble in Manchuria, however, in September, 1931, and the military operations which followed, created a new demand for arms, while the reimposition of the gold embargo, and subsequent decline of the value of the yen served to revive the industry. The growth of the machinery manufacturing industry can be gathered from the following table:

GROWTH OF MACHINERY INDUSTRY

(Unit: ¥1,000)

Kind	1914	1919	1921	1926	1929
No. of mills	388	590	526	4,429	5,296
No. of operatives	80,862	195,227	162,724	273,269	190,154
Value of production	110,906	716,241	568,322	538,917	682,162

Kind	1930	1931	1932	1933
No. of mills	5,604	6,479	6,738	7,850
No. of operatives	205,308	—	230,896	249,323
Value of production	615,682	443,340	543,842	888,195

Digitized by Google

The production of machinery in the factories where more than five persons are employed (exclusive of Government factories) for 1933 totalled ¥888,195,312, and compared with the figure of 1932, it showed an increase of over ¥287,000,000. This was the largest figure for the last decade, the previous recorded figure being ¥888,019,698 for 1912. Classified according to the size of mills, production by mills employing from five to thirty operatives amounted to about ¥125,000,000 or 14.1 per cent., by those employing from 30 to 100 operatives about ¥123,000,000 or 13.9 per cent., by those employing from 100 to 200 operatives about ¥86,000,000 or 9.7 per cent., and by those employing more than 200 operatives about ¥553,000,000 or 62.3 per cent. In examining the number of mills classified according to the number of operatives employed, those which employed from five to 30 operatives were 6,735 or 85.8 per cent. of the total, those employing from 30 to 100 operatives 817 or 10.4 per cent., those employing from 100 to 200 operatives 151, or 1.9 per cent., and those employing more than 200 operatives 147 or 1.9 per cent. Thus, the amount of production per mill differs extensively according to the class of mills. In the instance of mills employing from five to thirty employees the average production per mill was ¥18,560, in those employing from 100 to 200 operatives ¥573,081 and those employing more than 200 operatives ¥3,762,696.

The classes and kinds of machinery are so many and varied that it will take too much space to give an account of all of them. We have, therefore, divided them into the following classes for convenience:

Ordinary Machinery
Electrical Machinery
Locomotives and Rolling Stock
Aircraft
Automobiles
Shipbuilding

and a brief account of some of representative ones in each class will be given in the following columns.

Ordinary Machinery

Manufacturing Machinery The manufacturing machinery has made a rapid progress owing to big demand. All makers are very busy to enlarge their mills. But on account of difficulty in delivery of domestic makes within the time required, advantages are being taken by imported machineries. The large makers have formed an association for export, which promises future development.

Casting and Casting Machinery Castings which are related with service supplies industry and machinery for exorts are active, although those related with agricultural implements are still inactive

The tendency to perform casting by machinery has suddenly become strong in recent years along with the activities of service supplies industries. This tendency is especially noticeabe in automobile and aeroplane manufacturing plants. Though high-class castings are still imported from Germany and America, machines like sandblast, moulding machines, cupola, etc. are successfully made in Japan.

Air Machine Recently the demand for air machines has considerably increased and Japanese machine manufacturers quickly caught the opportunity so that most of air machines are now self-supplied. Especially pneumatic tools such as air-compressor, rock-drill, and pick-hammer, air motor and air hoist are manufactured in great numbers.

Machinery for Chemical Plants It is only in recent years that machinery

Digitized by Google

used in chemical industry drew attention of large machine manufacturing mills. The progress and development of chemical industry, however, has been so great that the manufacture of chemical machinery now forms an important part in machine manufacturing industry. In foreign countries makers of chemical machines are at the same time contractors for the plants and are responsible for their success or failure, but the manufacturers of Japan have not attained that stage yet.

Wood-Working Machine Activity of shipbuilding and rolling stock industries has stimulated the manufacture of wood-working machines and the Japanese machines have almost expelled imported ones and are exported to America, South Sea Islands, India and Siam in a considerable amount.

Cranes Cranes made by Japanese factories went in a large number to iron, steel, cement and chemical mills and mines, and they are going to check the import of foreign machines in the near future.

Spinning Machine It is needless to say that spinning industry in Japan achieved a wonderful progress in recent years. One of the causes of the success is due to the excellent spinning machines invented in Japan. Almost all machines in spinning mills are now manufactured in Japan and it is rather difficult to find foreign spinning machines used in most of new advanced mills in Japan.

Pumps At present pump manufacturing is altogether independent of foreign technique. Pumps for public works are constantly improved to meet new demands and the manufacture of pumps made of materials acid-proof or alkali-proof which are used in chemical and rayon industries has made a great progress.

Engines and Boilers Great activities shown in new constructions and extension works of power houses and of various manufacturing companies would tell at once what would be the effect on engine manufacturing, the activities of which industry are unprecedented. Mills of Toyo Babcock Co., Ltd. and others have orders on hand to the fullest extent. This manufacturing is making new records in type, in capacity, steam pressure etc. Largest orders are coming from power houses, steamers and battleships for supplementary use, chemical industries, artificial silk mills, and other textile industries in the order named.

Agricultural Machinery and Agricultural Implements The demand for equipments for supplying water, for cleaning rice, etc. increased fifty per cent. in number as compared with that of two years ago. Owing to the high cost of raw materials, however, the profit of manufacturers is not so large.

Machinery for Mining Stimulated by the activities in the heavy industries, both coal and metal minings have been extremely active since 1932, and it is anticipated that there will be no depression in this industry for several years to come. Under the circumstances, manufacturers of mining machines are enjoying almost unprecedented boom. These machineries are classified into mining, selecting and smeltering machines, of which the latter are more important and vary to a great extent in kinds, etc.

Machinery for Building and Public Works The Government's policy to undertake public works as relief measures for farmers has naturally opened a way for big demand on machinery for building and public works. The purchase of road rollers, locomotives, crushers, etc. has been considerable.

Printing Machines As to printing machinery high speed and high

Digitized by Google

grade machines are in vogue. To meet the requirement of high speed printing the use of rotary press has developed while the increase of demand on the gravure and offset machines shows that the higher grade machines are popular. Manufacturing of high speed and high grade printing machines has now so advanced that not only import of these has come to be negligibly small, but domestic makes are exported to Manchoukuo, South China, the South Sea Islands, and India to a great extent.

Gauges and Optical Machinery Of all gauges those that have the greatest future prospect are perhaps electric gauges, to which optical and mechanical gauges will follow in the order named. At present the study is being directed mainly on gauges for aeroplanes, and there is a very keen competition among makers for their successful manufacturing. Gauges, which require exactness, are optical ones, and the authorities concerned seem to be directing their attention for the production of high-class optical instruments. In the past the manufacture of gauges was carried out by various makers in their own ways, no unified control on production was possible, and seriously hampered its development. The Department of Commerce and Industry appears meditating to impress upon the makers with the advisability of instituting an organ whereby to control the production and sales of gauges.

Various Tools and Implements The demand for various tools and implements in recent years has been very strong. Due to the lower exchange rate of yen, the price of imported tools and implements became very high which served as a great stimula for development of domestic manufacture. Technique of manufacturing these tools and implements has made a great advance, and most of imported ones are replaced by domestic makes. Demand on imported ones is restricted to those of superior class. Many new mills have sprung up, and tool and implement industry appears enjoying its golden age.

In addition to the above there are numerous other machines, instruments and tools, which are enjoying boom with more or less degree due to general industrial activities. Some of the more important ones are:

Welding and cutting appliances, dyeing machinery, conveyors, gears and gear cutters, stokers, cleaners, ball bearings, steel balls, various musical instruments, scientific instruments, etc., etc.

Production Production of all machinery and tools which come under this class follows:

PRODUCTION OF ENGINES

Electrical Machinery

Introduction The general economic prosperity increased the demand on electric power to a tremendous extent, which stimulated the construction of big thermal power houses, and extension and completion of power cables. An epoch-making improvement has also been effected in the construction of electric machinery which use high voltage, such as thermal electric dynamo, transformer, rotary converter, switch-board, frequency changer, induction voltage regulator, etc., many of which have an astonishing large capacity and produce a high revolution such as never have been imagined before. The same sort of development has been attained in electric machinery and instruments which use electricity of smaller power. The following are some of domestic electric machinery which deserve attention:

Description	Capacity
Water Wheel Dynamo	40,000 KVA
Thermal Dynamo	50,000 K.W.
Synchronous Advancer	30,000 KVA
Non-Synchronous Advancer	30,000 KVA
Frequency Changer	15,000 KVA
Rotary Converter	6,600 K.W.
Self-Cooling Transformer	22,000 KVA

Thermal Dynamo Domestic makes are now replacing the imported ones. To cite only a few examples of those recently manufactured: five units of 53,000 k.w. installed for Kwansai Kyodo Kwaryoku, one unit of 12,500 k.w. for Hokkaido Dento, one 30,000 k.w. unit for Yawata Seitetsusho, and one 35,000 k.w. unit for Toho Denryoku are notable ones.

Turbine (thermal) Owing to rapid increase in the number of thermal power houses, manufacturing of turbines is showing a great activity.

Mitsubishi and Ishikawajima received orders for a turbine of 53,000 k.w. from Kwansai Kyodo Thermal El. Co., while the latter installed a 58,000 k.w. turbine for Tokyo Electric Light Co., Ltd. at their Tsurumi Plant. Hidachi Seisakusho accepted also an order from Yawata Iron Works of the Japan Iron Mfg. Co. for 30,000 k.w. turbine.

Hydraulic Dynamo Hydraulic dynamo manufacturing is controlled exclusively by domestic makers and is in its most prosperous stage, showing a great progress both in art and in volume of production as compared with its status of a few years ago. Three units of 40,000 KVA manufactured by Shibaura Seisakusho for Chosen Hydro-electric Co., one 52,000 k.w. unit manufactured by the same company for Yahagi Hydro-electric Co. one unit of 60,000 k.w. manufactured by Hidachi Seisakusho for Japan Electric Power Co., Ltd., are good examples. Since almost all the electric power companies are enthusiastic for building larger power houses, this manufacturing work promises a further development.

Direct Current Dynamo The demand for the direct current dynamo has increased rapidly for charging, experimenting, for steamers and wireless telegraphy. Dynamos of both large and small capacities are selling well. It deserves a special notice that small mills of various manufacturing concerns and cotton goods plants are installing dynamos of small capacity for lighting purpose.

Electric Motor The demand for electric motors has become very strong on account of activities in the industrial world, especially in spinning, munitions and cement industries. Kinds and types of motors manufactured vary to a great extent. One motor capable of producing 23,000 HP. which is considered as one of the largest in capacity in the world and a synchronous motor of 1,100 HP. have been manufactured by domestic makers. Special motors of high ef-

Digitized by Google

ficiency which are required in cotton spinning mills, agricultural districts, etc. are successfully manufactured.

Water Wheel Manufacturers of water wheels have considerable difficulty due to the fact that different wheels must be made for high and low heads. For instance, Koguchigawa No. 3 power house of Nihonkai Hydro-electric Co., Ltd. has a head of 118 metres which is considered the highest head in Japan. On the other hand, the study on turbines, etc. for a power house built for the purpose of raising water is being made by companies like Chūō Electric Co., Ltd.

Transformer Great demand for electric power has naturally caused the increased manufacture of transformers, both large and small in size. Study has been made as to location and capacity of transformers and as the result transformers of various types and kinds are being manufactured. Some transformers with a capacity of 43,000 KVA or others with voltage regulators, etc. are manufactured successfully.

Converter or Phase Advancer Condenser converters of comparatively large capacity are being manufactured by large electric machinery makers. Recently, a rotary converter which generates 6,000 k.w. and 10,000 amperes, synchronous converters which produce 6,600 k.w. and mercury arc rectifier which generates 2,000 k.w. have been manufactured. Some of the smaller converters use oil filled cables, and there are many kinds and types of the latter.

Cable and Wire The firm of Sumitomo has done much research work on the GP submarine cable, but now the subject of research has been shifted to the lead-covering. Not only three large firms, viz. Sumitomo, Furukawa, and Fujikura, but also Nihon Densen and the Tokyo Cable Manufacturing Company are also undertaking the work, and such high-class cables and wires are produced in great quantities that the import of these articles has now become an old story. Among the manufacturers are included not only those big firms mentioned above, but also over a hundred of those which rank with Dainippon Densen or Tsuda Densen.

Electric Furnace The demand for electric furnaces has recently become very strong along with the development of the metal industry. Electric furnaces having capacities of as large as 1,500 KVA and 2,000 KVA are produced.

High Speed Oil Circuit Breaker Along with the increase of voltage, the increase of speed of breaking circuit becomes a resultant requirement. Both physical and chemical researches have been made and the perfection of making a breaker which cuts the circuit at an exceedingly high speed is amazing. As to its size, a circuit breaker, the capacity of which is as large as 2,000,000 KVA is manufactured.

Automatic Voltage Regulator The voltage regulator is now being installed independently or with a converter by power houses in various places, and these regulators are showing excellent results. Recently regulators have been freely installed with 22,000 volt and 150,000 volt pressures in power cables and proved their 100 per cent. efficiency in each case. They are of superior makes, and are being manufactured only by large makers.

Electrode The rise of electrochemistry and the activities of electrolysis industry have brought about an amazing development in the electrode manufacturing industry. Electrodes of large size and of good quality are now produced in Japan and import of this article has become negligibly small. Principal makers are the Tokai Electrode Co., Ltd., and

Digitized by Google

the Nippon Carbon Co., Ltd., and companies other than these are merely making raw materials for the same.

Current Limiter In order to rationalize the charge for electric light and also to restrict the abuses of electricity an electric current limiter has been invented and it is actually used by the Osaka City Electric Bureau, the Hanshin Electric Railway Co., the Hanshin Express Electric Railway Co., Ltd., and other electric power supply companies. There are many kinds and types of current limiters, some of which are of very high quality.

Broadcasting Apparatus In any of Japanese broadcasting stations no broadcasting apparatus of domestic make was installed in the past. They were those manufactured by the Marconi Co., Ltd., the International Electric Company, G. E., etc. However, the situation has now been completely reversed, and apparatus of large capacity are being manufactured by the Nippon Denki Co., Ltd. and the Tokyo Denki Co., Ltd. The Nippon Denki manufactured 100 kilo one for the Hsinking Broadcasting Station in November, 1934.

Dry Cells This industry has made a great progress in these years, and its production now reaches ¥10,000,000 a year. The domestic products not only fulfill the total demand in the country, but they are also being exported to Manchoukuo, China, the South Sea Islands, etc. It was prescribed as one of the principal industries of the country and is controlled as such. It is also now under consideration to include it as one of the principal export articles.

Production Production of electric machinery and instruments in Japan in recent years are as follows :

Locomotives and Rolling Stock

Of all the mechanical industries, few compare with that of the manufacture of locomotives and rolling stock in largeness of amount of production and value. Nearly 90,000 locomotives, passenger cars, freight cars, electric cars, etc., are owned by the Department of Railways of the Imperial Government, and most of them were manufactured in the Department's works in Omiya, Oi, Hamamatsu-cho in Tokyo, Takatori in Kobé, Kokura, etc. In addition they are manufactured by a few private companies.

When the first railway was constructed, in 1872, between Tokyo and Yokohama, locomotives were imported from Great Britain, so in the beginning nearly all the locomotives were of English-make, but later they were replaced by locomotives imported from America.

The first locomotive to be manufactured in Japan was turned out by a Kobé mill, now belonging to the Department of Railways, in 1893, and the Kisha Seizo Kaisha turned out its first in 1896. Later, in 1910, the Hyogo mill of the Kawasaki Shipbuilding Co., Ltd., started manufacturing locomotives on a large scale, and about the same time the Department of Railways also began to do the same. From that time locomotive manufacturing developed at a great pace and since 1912 their importation has practically ceased. During the World War, the Nippon Sharyo Kaisha, Ltd., and the Kasado

Digitized by Google

mill of the Hidachi Seisakusho were established, and in 1924, the Mitsubishi Shipbuilding Co., Ltd. entered the industry, and at present Japanese works are not only filling home requirements but are exporting to Korea, Formosa, Manchoutikuo and China.

The manufacture of passenger cars has also advanced, four and six wheel bogie-cars being made. The highest speed of passenger trains has been increased to 64 m.p.h. and as the Japanese gauge is a narrow one of 3' 6" it has been necessary to make intensive studies to reduce rolling. As the result of the studies, new devices have been applied and good results achieved.

Electric locomotives were imported from Germany in 1912, and since then, with the exception of 14 locomotives which were manufactured at the Omiya Works of the Department of Railways, only imported ones have been used.

Situation in 1934 Through the popularity of cars and locomotives of so-called "streamline form" and the attempt to make higher-grade cars, locomotive and rolling stock manufacturing is showing a great activity, especially in the works which have orders from Manchoukuo. Making of higher grade cars has a direct bearing upon makers of parts and trucks. On account of increased demand for Diesel and gasolene locomotives, the demand for small-sized steam locomotives has somewhat slackened. But on the other hand, the demand for trucks for electric tramway, etc. has increased.

Steam Locomotive Owing to electrification of private railways and the advance made by gasolene cars, it is now very seldom that private railway companies use steam locomotives. Accordingly makers have now hardly any orders coming to them except from the Department of Railways. Only a few makers are manufacturing small-sized locomotives for mining and public works. Even these are now being driven out by small-sized gasolene or Diesel locomotives. Some makers have, therefore, totally given up the manufacture of steam locomotives and are employing their efforts for the manufacture of locomotives using Diesel engines.

Electric Locomotive On account of the increased electrification of railways, new ideas are constantly put into the improvement of electric locomotives. Important points in improvement are the application of electric arc welding method and lightening of weight. In future, the centre of gravity of locomotives will be lowered and the "streamline form" will be adopted in order to increase the speed. New improvements such as equipments for sprinkling sands to prevent racing, or those to recover lost electric power, will perhaps be made in near future.

Rolling Stock Orders coming from private railway companies on rolling stock are very small, being limited to a few gasolene or ordinary passenger cars. However, makers are well satisfied with orders coming from electric tramway companies, and especially with orders coming from Manchoukuo.

Electric Car Electric cars are divided into those having motors on them and other ordinary cars, which are again subdivided into passenger, freight and emergency cars. Private railway companies want to keep pace with further electrification of the government railways, and intend to electrify their lines and increased distribution of cars and replacement of old cars with new ones will inevitably increase the demand, and the prospect of this industry can be said to be very bright.

Aerial Cable As the safety of aeri-

Digitized by Google

al cable has come to be recognized, the fever for its construction has become very intense. For the carriage of goods, various mining and cement companies are now changing means of transportation from ground railways into aerial cables, which is making this industry very active. This activity is beng further stimulated by construction of aerial cables in Manchoukuo.

Various Appliances Controller, brake, brake shoe, pointer, separator, etc. are successfully manufactured and mills are active to a greater or less degree.

Aircraft

Introduction Captain Tokugawa was the first pilot to fly a heavier than air machine in Japan. This was in 1910. The manufacture of aircraft was commenced in the Army and Navy arsenals and, furthermore, many arms of the service from private companies. The manufacture of aeroplanes was greatly encouraged in this way and military and naval aircraft can now be satisfactorily manufactured at home.

History Dr. Ichita Kishi, a physician, constructed at his own expense various workshops in his own residence at Tsukiji, Tokyo, and, in 1914, with the help of several expert engineers, succeeded in constructing an aeroplane engine, the first to be manufactured in this country. A trial flight of the aeroplane using this engine was very successful, so he manufactured his second aeroplane in 1916. In 1917 Mr. Nakajima, who was an engineer captain in the Navy, manufactured various kinds of aeroplanes with the help of Messrs. Mohei Ishikawa and Sei-

Digitized by Google

bei Kawanishi. In 1920, the Aichi Tokei Denki Kaisha, Ltd. (Aichi Clock Electric Machinery Co., Ltd.) established an aeroplane department and in 1920 turned out a seaplane. From that time this department has developed rapidly. In 1921, the Kawanishi Machine Company established an aeroplane factory in Hyogo and started the manufacture of seaplanes in 1923. Also, in 1921, the Mitsubishi Aircraft Co., Ltd., had nine experts in aeroplane manufacturing called from Great Britain and began to manufacture both aeroplanes and engines on a large scale. The Kawasaki Shipbuilding Co., Ltd., following in the steps of the Mitsubishi Aircraft Co., Ltd., began manufacturing aeroplanes in 1922.

Present State of the Industry Aircraft manufacturing industry showed considerable activity in 1934. Aside from requirements of the military circle, manufacturers received good orders from the public owing to the fact that many contributions of aircrafts were made to the army and navy by different bodies of people. As regards manufacturing of light aeroplanes for transportation purpose, one manufactured by the Tokyo Gas & Electric Co., Ltd. towards the latter part of the year proved a great success. Other aircraft manufacturers received orders on aircrafts of the same type. Manufacturers of aircrafts at present are as follows:

MANUFACTURERS OF AIRCRAFTS

Automobile Manufacturing

History The first automobile to be manufactured in Japan was by the Tokyo Motor Car Works, under the management of Mr. S. Yoshida, in the year 1909, but since then progress has been very slow. In 1910, several military motor cars were manufactured for the Army in the Osaka Arsenal, and in 1911, the Tokyo Automobile Factory commenced the manufacture of "DAT" cars.

The Tokyo Gas and Electric Co., Ltd., began to manufacture military automobiles "T. G. E." in 1916, and trucks in 1917. In 1918, the Military Automobile Subsidy Act was put into force and this company was the first to get a subsidy from the Army Department under the act. Then the Tokyo Ishikawajima Shipbuilding Co., Ltd., began to manufacture passenger cars in 1920. Companies other than the above which are making automobiles are Hakuyo-sha, Ltd., and the Orient Automobile Co.

Present State of the Industry Motor car industry is perhaps the only one in all the heavy industries in Japan which the country has not anything to feel proud of to-day. While there are more than 135,000 cars, buses and trucks of all kinds which are running throughout the country, almost all of them are imported, about 80 per cent. of which being Chevrolet of the General Motors Co. and

Digitized by Google

Ford. The balance of 20 per cent. consists of those of Chrysler line and a small number of European makes. However, inasmuch as the motor car industry is entirely undeveloped in Japan yet, it can be said that there is a great future for Japan's automobile manufacturing industry.

Passenger Car There are no passenger cars manufactured in Japan which are worthy of mention, except "Atsuta-go" which are modeled after Nash and White and aside from the small model cars of "Datsun" there are no other domestic cars.

Bus and Truck Bus and truck manufacturing by domestic works is slightly better than passenger car making. Each "Chiyoda" manufactured by the Tokyo Gas and Electric Co. and "Sumida" made by the Jidosha Kogyo Kaisha has a long history. The companies are also jointly making "Isuzu" designed by the Department of Commerce and Industry. These three classes of buses and trucks are supplied to the market in considerable numbers. Kyodo Kokusai Jidosha which was established in 1933 by these two companies is selling domestic trucks and buses of five classes. Aside from this, the Mitsubishi Heavy Industry Co., Ltd. is making large-sized bus "Fuso-go" at its Kobé plant, the Kawasaki Sharyo Kaisha, Ltd. truck and bus "Rokko," and Tokyo Association of Dealers of Motor Cars is planning to make another kind for trial.

Miniature Motor Car and Motor Cycle The so-called miniature motor cars are those the dimensions and power of which are limited by the "Regulations of Motor Cars" and include such small-sized cars as "Datsun" car, rear cars, etc. Rear cars have made a marvelous development in Japan as a means of carrying small parcels. Their production totalled 15,000 a year, and they are not only in use throughout Japan but are exported to Manchoukuo, the South Sea Islands, etc. Its manufacturing is showing activity due to low exchange rate and increased demand. The sales of small-sized cars like "Datsun", too, are rapidly increasing in number in late years.

Accessories and Parts Accessories and parts of motor cars in Japan were almost exclusively of American makes before replacement of the embargo on gold in 1931. Owing to low exchange rate which followed thereafter import became very difficult and domestic makes came to the front. At present, even parts of Chevrolet or Ford are being replaced by domestic makes. They are now also exported abroad. Countless parts and accessories are made in domestic works, and the quality of these makes is rapidly improving.

Import of Automobiles Due to the backwardness of the automobile industry in Japan, the country has largely relied on the import for their supply in the past. In 1914 the import barely amounted to ¥500,000, but this rapidly increased and in 1929, it amounted to ¥30,000,000. Owing to depression it dropped to ¥20,000,000 in 1930, and to ¥14,000,000 in 1933, which was the bottom. The figure took an upward course again and rose to ¥33,000,000 in 1934.

IMPORTS OF AUTOMOBILES & ACCESSORIES

Year	Number of automobiles	Value yen	Value of accessories yen	Total values yen
1924	4,063	8,772,851	12,413,272	21,186,123
1925	1,762	4,630,009	7,062,433	11,692,442

Bicycle Manufacturing

History A bicycle was first introduced into Japan in 1881 by an Englishman. In 1889, an American brought a bicycle with him from America. In 1904, frames and other accessories were imported from Great Britain, and the making of bicycles at a lower cost became comparatively easy. In 1906, accessories were imported from the U. S. A. and this time, bicycles became very popular.

Before 1913, accessories other than saddles, rims, and chains were being manufactured at home. Factories capable of manufacturing these latter articles on a large scale did not exist and it was impossible for small scale producers to compete against foreign products. From 1913 on, however, the demand for bicycles increased at great speed, and as the manufacturing of each of the above parts on a large scale became possible, bicycles came to be produced at a very low cost, though until the World War, those manufactured in Japan could not compete with European-made ones. During the War, the art of manufacturing advanced so much that domestic bicycles could well compete in both quality and price with imported ones, and not only were home demands satisfied, but the Japanese product was exported to China, Russia, India and other countries.

Bicycle in 1934. Bicycles which are used in Japan number 7,000,000, which means that every nine persons own one bicycle. This fairly compares with Holland where the ratio is one bicycle to every seven persons. Moreover, the quality of bicycles made in Japan is so good that no country in the world can compete with her in this respect. To-day export of bicycles and accessories amounts to ¥25,000,000 a year, and bicycles made in Japan can be seen in every country except in Soviet Russia. The industry is now carried out in a perfect division of labour, and manufacturers number 800, who are located in Tokyo, Osaka, Nagoya, Kobé, etc.

Conditions Suitable for Bicycles Conditions in this country are well suited to the use of this vehicle. The factors which have made for the increased demand are:

(1) Individual wealth is comparatively small and the use of automobiles has not yet become universal.

(2) Roads are mostly too narrow, though greatly improved of late, to take automobiles.

(3) The making of bicycles, especially accessories like rims, is purely artisans' work, and is a type of work in which the Japanese people excel.

PRODUCTION OF BICYCLES IN JAPAN

Year	No. produced	Value	Value of accessories produced
		yen	yen
1924	92,172	2,751,270	—
1925	88,229	864,796	—
1926	41,832	1,112,621	—
1927	89,629	3,093,083	—
1928	125,588	3,323,999	—
1929	90,285	2,593,051	16,138,063
1930	136,985	2,790,331	12,206,274
1931	105,088	2,022,018	13,747,235
1932	63,968	1,315,748	20,666,605
1933	118,405	2,164,804	26,396,495

These figures do not include production in factories employing less than 5 persons.

The principal places of production are Tokyo, Osaka, Aichi, Hyogo, and Ishikawa prefectures. Production in each of these prefectures in recent years is as follows:

Prefectures	1931	1932	1933
	yen	yen	yen
Tokyo	5,532,820	7,927,974	9,818,150
Osaka	4,666,797	6,830,222	10,567,187
Aichi	2,687,949	2,858,530	3,663,442
Hyogo	1,615,353	2,325,811	2,386,320
Ishikawa	357,023	580,133	661,228

Imports and exports of cycles and accessories since 1923 are as follows:

Year	Imports	Exports
	yen	yen
1924	7,673,000	745,000
1925	6,216,000	2,295,000
1926	5,923,000	1,959,000
1927	3,527,000	1,879,000
1928	1,634,000	2,557,000
1929	1,280,000	3,429,000
1930	1,563,000	5,274,000
1931	1,153,000	7,119,000
1932	795,000	6,028,000
1933	619,000	12,114,000
1934	73,308	18,904,257

Tyres are not included.

Import of Machinery

Import of machinery in 1934 totalled ¥143,590,180, which showed a gain over that of 1933 which was ¥106,574,614. This was due to lower exchange rate and increase of imports of some special machinery on which the demand was strong on account of the general industrial activity in the country. However, this figure was smaller than the 1929 figure of ¥186,832,556. The import as a whole has a declining tendency. This is perhaps due to the following reasons:

(1) The machine manufacturing industry has made a great progress, and,

(2) The depression has reduced the demand for machinery.

The rapid development of industries of many kinds which has taken place since the Restoration has created a great demand for machinery, but as it takes a long time to train experts and workers to produce machines of superior grade, Japan has had, in the past, to import most of her machinery. Now, with careful study and training on the part of her engineers, it has become possible to turn out machines which are not inferior to any imported ones, and Japan can now buy these at comparatively low prices. The depression which started in 1920 has become very acute in late years, and has brought about a great falling

Digitized by Google

off in the demand for machinery. These two reasons account for the falling off in imports.

Imports of machinery by Japan, excluding automobiles and their accessories, from 1919 to 1928, was somewhere between ¥100,000,000 and ¥140,000,000. There was a sharp reduction in 1930, and in 1931 it reached the bottom. The latest two years are gaining again. (See Chapter XI.)

Export of Machinery

In 1934 Japan witnessed the highest record in the export of machinery of her own making. The volume of export was ¥124,982,223 which was about double of the preceding year's export of ¥67,622,067. In addition to this the export of tools and other metal manufactures was ¥59,054,665 as against the 1933 figure of ¥42,604,224. The future of Japan's machinery manufacturing depends upon the degree to which her export of machinery expands, and especially upon the development of Manchoukuo market. The invasion of Japanese products into the Dutch East Indian, Indian and other foreign markets is a matter for future prospects. The export of Japan-made spinning and weaving machines is very promising. Especially the Toyoda Automatic Weaving Machines are very much demanded abroad, where the spinning industry prospers. These machines used to be exported to China, mostly Shanghai, to be used by Japanese spinning mills in Shanghai. Last year 25 machines each equipped with 400 spindles were sent to Ahmedabad spinners in India. Diesel-engines to be fitted with fishing ships are built in Japan and shipped to the Dutch East Indies. A British firm purchased the Toyoda patent for ¥1,000,000, but when the machines were installed in England, a vigorous protest was raised by British mill hands. Japan-made machines exported during the last three years follow :

	1932	1933	1934
	(In ¥1,000)		
Spinning and weaving machines	3,650	4,878	8,378

Factories and Operatives

Factories in which various kinds of machinery were manufactured were, in 1933, 7,850 ; workers and operatives numbered 249,323. These figures include persons engaged in the shipbuilding industries. Factories showed an increase of 1,112 over the previous year and the number of operatives also increased by 18,427.

Details of the number of mills, operatives, etc., in 1933 were as follows :

Shipbuilding

Introduction

The mercantile shipbuilding industry in Japan developed with the shipping business, while the development of warship building was mainly due to the urgent demands created by the Sino-Japanese and the Russo-Japanese Wars.

Owing to the construction of new vessels to be placed on subsidized lines, easy money and low interest rates, the shipbuilding industry which had been depressed since the close of the World War, revived and boomed temporarily in 1928. Tonnage output, which in 1919 amounted to as much as 674,000 tons, dropped to 53,000 tons in 1926. This was increased to 112,583 tons in 1928, and to 167,365 tons in 1929. However, as the improvement was brought about artificially and not by general improvements in economic conditions, the industry soon became dull again, and was further depressed by the enforcement of the conditions of the London Disarmament Agreement. Naval orders to private shipbuilding companies were reduced by 30%, which, together with the decreased orders from private transportation companies reduced the 1931 output to 84,004 tons and in 1932 to 58,763 tons.

Shipbuilding in 1934

Owing, however, to the subsidies granted by the Department of Communications since 1932 for the improvement of steamers, shipbuilding industries have shown some activities since. The subsidies were granted with an aim of constructing 200,000 tons of new steamers, and closed at the end of March, 1935. The second subsidies will follow and the shipbuilding industry will be more than ever busy. Furthermore, the supplementary plan of the Navy is benefiting authorized dockyards, while orders on cruisers, destroyers, torpedo boats, submarine sweepers, etc. are making other shipyards very busy and prosperous. In addition to this, due to the low exchange rate, enquiries for steamers are forthcoming from Brazil, Siam, Italy, France, Sweden, Soviet Russia, Manchoukuo, China, etc. Statistics as of August 1, 1934 shows that those steamers, the displacement of which is over 100 tons, and which were on keel on that date numbered 104 with total displacement of 143,016 tons, which is the highest record shown since April, 1930. It must not be overlooked that the tendency since 1933 is that small and medium-sized steamers with fast speed are in great demand. On August 1, 1934, the number of steamers whose displacement was less than 1,000 tons numbered 84, which was 80 per cent. of the total order. In 1933 there were 360 shipbuilding yards of which 55 build steel vessels while the remaining 305 yards other kinds of vessels. The statistics on various phases of the industry follow:

PRODUCTION OF VESSELS

Year	Steel Vessels		Ships of Other Classes		Total Value	Fittings of ships

CHAPTER XX

UTILITIES

Electricity

Historical Survey

The electric light and power industry in this country dates from November, 1887, when the Tokyo Electric Light Company undertook to light 75 incandescent lamps, using a home-made generator installed at the first commercial plant at Nihonbashi, Tokyo.

Hydro-electric power production was started in 1891 in Kyoto in connection with Lake Biwa canal works. Two motors with 80 kw. each were installed.

The electric railway industry began with the establishment of the Kyoto Electric Railway Co., Ltd., in 1895, followed by the Nagoya Electric Railway Co., Ltd., in 1898. With respect to long distance transmission of electric power, Koriyama Kenshi Boseki Kaisha, Ltd. (Koriyama Silk Spinning Co., Ltd.) succeeded, in 1889, in transmitting 10,000 volts 15 miles. In 1907, Tokyo Electric Light Co., Ltd., completed the hydro-electric power station of 15,000 kw. in Komabashi, Yamanashi prefecture, and succeeded in transmitting 55,000 volts for a distance of 50 miles. This marked a new era for the hydro-electric industry.

The Hydro-Electric Industry

For over 15 years after the electric power industry was first started, coal produced electric power was supreme, and the development of the hydro-electric industry was very slow. In 1903, of the total electric power of 44,000 kw., 31,000 kw. were produced by coal, the remaining 13,000 kw. were generated by water. However, after the Russo-Japanese War, the hydro-electric industry developed very quickly.

About that time, in view of the success in transmission of power for long distances, the Temporary Investigation Bureau of Hydro-Electric Power was established under the direct supervision of the Minister of Communications, and investigations as to the available water power were made throughout the country. As the result of these investigations and encouragement from the Bureau, hydro-electric power production quickly developed and by 1912 had increased to 233,000 kw. exceeding the thermally produced power by 4,500 kw. Development during and after the World War was rapid, especially after the great earthquake in the Kanto District in 1923. In 1933 the hydro-electric power developed totalled 3,168,705 k.w., while the thermal power amounted to 1,827,131 k.w. The rapid increase in production finally resulted in an over-supply of power, a factor which later became the weakness of the industry. However, a combination of factors has aided the industry to regain prosperity. After some years of practical idleness it has resumed construction of hydro-electric plants, and according to the Electric Bureau, Communications Ministry, work was in progress on 22 sites at the end of 1934 on the erection of plants with a combined capacity of 428,360 kilo-

Digitized by Google

watts, of which 420,000 kilowatts will be hydro-electric. Most of the work is expected to be completed by the end of 1935.

Present Position of Hydro- and Thermal Electric Industry

During 1931, the price of coal declined, and the cost of thermal electric power became lower than hydro-electric power, and from that time on thermal power began to draw attention. In 1934, owing to an increased demand for electric power, new plans for obtaining the source of power were contemplated, in which thermal power came to occupy an important position, inasmuch as it was then considered as an independent source, and not as a supplementary source to water power. In the same year the Kwansai Kyodo Kwaryoku Co. (thermal power), which was established to facilitate the plan of control of power, began to operate. The demand for power was so large that it exceeded the supply, and the company is obliged to increase its capacity to 250,000 k. w. before the end of 1935. In Kyushu districts, the Kyushu Kyodo Kwaryoku Co. was established in December, 1934. So also in Kwanto districts, a plan to establish the Kwanto Kyodo Kwaryoku Co., with a view to unifying the work of control of power, was advanced.

The Tokyo Electric Light has completed a plan to get 100,000 k. w. from the thermal source at Tsurumi before the end of 1935. The Daido Electric Power and the Toho Electric Power are each following suit in increasing about 45,000 k. w. through thermal source, and thermal electric industry is changing its position as from a supplementary to an independent one.

COMPARISON OF ELECTRIC POWER GENERATED (in k.w.)

Year	Hydro-electric	Thermal	Total
1907	38,622	76,288	114,910
1912	233,339	228,864	462,203

Trend of Demand

For Lighting In 1933 the number of electric-lighted households reduced by 147,205 as compared with the previous year. In the number of lamps, however, the ever advancing tendency was kept unchanged.

In 1933 the average consumer had 3.39 lamps and the average lamp used 21 candle power. These figures contrast with 2.4 lamps and 11.9 candle power in 1917. Of the total number of electric lamps which amounted to 38,382,771 in 1933, demand in the 122 cities comprised 57 per cent. or 21,864,282 in number, and the average number of lamps used in an urban household was 5.0.

The growth of the demand for power for lighting purposes in the country as a whole and in the prefectures, in 1933, is as shown in the following two tables:

Digitized by Google

GROWTH OF DEMAND FOR POWER FOR LIGHTING

Year	No. of consumers	No. of lamps	Candle-power for these lights	Electric power for these lamps kw.

For Power Purposes The increase of demand for electric power is even more marked than that for light. At the end of 1931, the number of motors obtaining power from electric power suppliers was 390,000 and the power supplied 1,320,000 h.p. The number of motors getting supplies from their own plants or from Government official plants was 129,000, the amount of power drawn being 2,513,000 h.p. This made a total of 519,000 motors and 3,833,000 h.p. and when compared with figures of 1922, the number of motors had trebled, while the h.p. had doubled.

Electric power supplied for purposes other than lighting or motive power, i. e., power supplied to the electro-chemical industry or for family use, amounted, at the end of 1932, to 951,412 kw., four times as much as that supplied in 1922. The increase of demand for electric power for private purposes deserves special notice and the following two tables show the growth of demand for electric power, since 1922, and the chief consuming industries.

AMOUNT OF ELECTRIC POWER SUPPLIED TO VARIOUS KINDS OF INDUSTRIES IN 1933

(in 1,000 k.w.)

Textile industry	516
Metal ,,	258
Machinery industry	147
Ceramics ,,	170

Manufacturing Industries Using Electric Power

Electrical Machinery and Apparatus Electric power is consumed, in addition to running electric motors and illuminating electric lamps, for manufacturing various electrical machinery and apparatus, electric bulbs, electric wire and cables. Electrical machinery and apparatus were originally mostly imported from abroad, but a manufacturing industry has gradually developed in this country, the development during the World War being particularly remarkable, and now large quantities of electrical equipment are being exported. The production in the last ten years is as shown below. In 1927 there were but 54,600 motors in the textile and dyeing industries, with an average capacity of 6.2 h.p. At the end of 1932 there were 123,200 motors, and the average horse power was 6.6 h.p. In the mechanical industries the gains have been even more pronounced. There the corresponding figures are 21,500 motors and 18.3 h.p. for 1927 and 75,200 motors and 8.03 h.p. for 1932. Over that six-year period the number of motors expanded 66 per cent. and horse power 59 per cent. and the average size of motor has fallen 57 per cent. The decline in the average size of motor is no reason of discouragement. On the contrary, it is a sign that electricity is finding its way into the smaller factores, into the machine shops, in other words, into the plants where it can save the most money.

Figures on the output of electric equipments during 1924-33 follow:

PRODUCTION OF ELECTRICAL MACHINES AND APPARATUS

Year	Electric machines and apparatus	Electric bulbs	Electric wires and cables	Total
	yen	yen	yen	yen
1924	88,764,000	18,030,000	87,738,000	194,331,000
1925	98,919,000	17,586,000	104,620,000	221,125,000
1926	105,202,000	16,106,000	113,551,000	234,859,000
1927	94,002,000	25,685,000	107,287,000	226,973,000
1928	125,395,000	26,817,000	109,742,000	261,954,000
1929	126,738,000	29,088,000	110,543,000	266,369,000

Electro-chemical Industry Stimulated by the development of various other industries there has been much progress in the electro-chemical industry, especially during the World War. The industry received a heavy blow when the reaction set in after the War, but as the variety of commodities produced by electricity expanded recovery was soon achieved. Production was originally confined to electro-copper, calcium carbonate and nitrogenous fertilizers, but of late years many new lines, as seen from the following table, have been added.

PRODUCTION OF ELECTRO-CHEMICAL INDUSTRIES

(in ¥1,000)

	1928	1929	1930	1931	1932	1933
Carbonate of lime, nitrogen and sulphate of ammonia	35,816	39,147	37,004	25,757	22,583	33,851

Electric Railway

The first electrification of railway was in 1904 on a part of the Kobu Railway, but since then great developments have been witnessed. The Communications Ministry was none too pleased with the multitude of applications for electric transportation permits. There is a feeling that the time has come to stop expansion of the electric lines of the country and to endeavour to restore a modicum of sense to the business. Private lines have almost doubled in number and more than doubled in mileage in the past 10 years. But the number of passengers has risen relatively little. In fact, ever since 1929 the passengers have been declining and in 1932 and 1933 there were fewer than in 1926.

This loss has been due to duplication of services, to bus lines and to the increased efficiency of the Government lines.

In 1932 there were 208 electric railway companies who supplied electric power to their own business and others, and the total power generated by them was 627,302 k. w. As to the results of the electric railway business both Governmental and private see Chapter XXV.

Electric Power Suppliers

The following tables show the number of suppliers of electric power and power supplied in 1933. Among the industries, many electric railways are operating their business on power purchased from power suppliers 30 per cent. of whom are themselves obtaining supplies from others. In the case of private, semi-private and Government-owned plants, most of them are buying about 65 per cent. of their requirements from electric companies.

Digitized by Google

The tables show also that the upward movement in the number of power supplying companies has practically come to an end. This does not mean that there no longer is any expansion, but that mergers are almost keeping pace with the establishment of new suppliers. Between 1932 and 1933 the number of operating concerns rose by but two. At the same time, operating companies which buy power rose from 391 to 417, so that the number of those generating dropped from 425 to 401.

Electrical Power Establishments and Increase of Power

In the eleven years 1922-33 both the number of establishments and power generated increased by from one-and-a-half to two times. Along with the great development in hydro-electric power stations a noteworthy increase in the number of thermal power stations took place. Hydro-electric power is generated on a very large scale and can be supplied at a much lower cost, so many industries have found it more profitable to operate machinery by purchasing power from large suppliers rather than generate their own or buy from small thermal producers.

In 1933 there was a sharp gain in the number of companies generating electricity. Constrasted to the 1932 advance of 302 companies making their own power, the 1933 figure was 767. Practically all the gain was in private companies, 731 to be exact, against 216 in 1932.

Installations which are being made are mostly small. In 1930 the average size of the 5,661 private plants was only 131 k.w. In 1932 the 6,226 private plants averaged 74 k.w. In 1933 the average for 6,957 installations was 75 k.w. Electrification is obviously spreading to the small factories.

The Industry in 1934

Trend in General Electric industry was recovering from depression with 1931 as its bottom. Towards the close of 1933, a plan to control electric power was completed and the year 1934 derived benefit from it. Owing to great industrial activities as well as the control which came to show its efficiency, the declining tendency of power rates stopped in 1933, and in 1934 it took an upward turn. The control by the Government made

Digitized by Google

one step further in 1934, for it began to look over both generation and transmission of power. It succeeded in perfecting a plan of control over three principal districts of Kanto, Chubu and Kinki. On the other hand, electric power companies reopened works of constructing power houses, the continuation of which was suspended or postponed for some reasons, and increased capacities of the old plants to meet the increased demand, and the industry in 1934 displayed great activities.

Improvements in Conditions of Loans The total loan of power companies amounted to ¥900,000,000, most of which were to mature between 1934 and 1936. With the adoption of open-end mortgage system, the interest rate has been reduced from 0.5 to 1 per cent. on average, and the big five companies succeeded in reducing interest rate for ¥550,000,000, so that if the total loan of all the power companies whose interest rate was reduced were taken into consideration, it would become a vast sum. On account of the comparatively firm tone of foreign exchange, foreign loans were also reduced through purchasing them.

With the improved monetary situation, shareholders of power companies became more lenient toward the latter, and many companies such as Nihon and Toho Power succeeded not only in increasing dividend, but also in extending capitalization. Ujigawa and Daido Electric Power are going to follow suit.

Business Result Business results of electric power companies showed great improvements, Nihon and Toho Electric Power increased dividend by 1 per cent., Tokyo Electric Light revived 4 per cent. dividend, and Daido and Ujigawa Electric Power are going to revive dividends. Power companies other than these are going to do the same, some having already succeeded in increasing capitalization.

Changes in 1934 New electric enterprises, new business opened, power stations completed, mergers, transfers, etc. in 1934 as investigated by the Communications Department follow:

Electric Power Generated in 1934 Changes made in electric power generated classified according to principal districts follow:

CHANGES IN ELECTRIC POWER GENERATED

in k.w.h.

District	In 1933	In 1934
Mainland	14,077,054	15,446,967
Shikoku	357,639	432,251
Kyushu	2,425,426	2,508,443
Hokkaido	543,407	690,971
Total	17,403,526	19,078,632

Foreign Loans Foreign loans of the big five power companies stood in February at $84,000,000 for Tokyo Light, $10,825,000 for Toho Power, $19,426,000 for Daido Power, $7,568,000 for Nihon Power, and $8,900,000 for Ujigawa Electric. Of these, holdings of Tokyo Light amounted to $6,004,000, Toho Power $4,835,000, Daido Power $1,800,000, Nihon Power $2,950,000, while the amount held by Ujigawa Electric is unknown. At the end of April, the Finance Department permitted the

Digitized by Google

purchase of foreign debentures for redemption to the amount of ¥22,300,000 (¥15,000,000 for Tokyo Electric, ¥3,000,000 for Toho Power, ¥2,500,000 for Ujigawa Electric, and ¥1,800,000 for Nihon Power) as an exception to Capital Flight Prevention Law. However, owing to the rise in value of the debenture bonds on account of low interest rate at home and inflation policy in America, little interest was shown for the purchase of the loans. Moreover, the power companies did not feel the necessity to do so on account of stability of exchange at about $28 or $29. The fact that these companies needed funds for development of new sources of power made them appropriate more money for those and the amount of foreign loans obtained in 1934 was small.

In reviving dividend of 4 per cent. in the latter term of 1934, Tokyo Light announced its inability to adhere to the gold clause in its indentures, which drew an attention. However, apart from the development of the question of gold clause in America, electric power companies resolved not to adhere to the gold clause. The foreign loans which once threatened the possibility of management of electric companies came to show that they no longer act as heavy burdens to the companies. They, therefore, came to take it wiser to appropriate funds in other directions than to make haste in redeeming the loans.

The Big Five

Five leading power companies, whose authorized and paid-up capitals, profits, etc. are given in the table below, supply electric current to 33% of the total number of lamps, besides 55% of the total other power. They practically dominate the electrical industry at present.

FORMATION OF CAPITAL, ETC. OF FIVE LEADING POWER COMPANIES AT THE END OF THE FIRST TERM, 1934

(In ¥1,000)

Companies	Head Office	Auth'd capital	Paid-up capital	Loans	Div'd
Tokyo Electric Light	Tokyo	429,562	429,562	369,434	—
Nihon Electric Power	Osaka	120,955	120,955	88,182	5%
Toho Electric Power	Tokyo	130,000	130,000	123,644	6%
Daido Electric	Tokyo	176,000	130,973	100,488	—
Ujigawa Electric power Co.	Osaka	92,500	92,500	86,494	—

Capitalization and Profits

The total authorized capital of different companies in 1933 amounted to ¥4,511,663,000 of which the paid-up capital was ¥3,494,202,000. Debenture and other loan accounted for ¥2,301,268,000, while the total fixed capital was ¥5,194,702,000. The establishment of great power stations, and transmission of power for long distances were the chief causes of the increase of capital.

TABLE SHOWING INCREASE OF CAPITAL, DEBENTURE AND OTHER LOANS, 1922-1932

Years	Authorized capital	Paid-up capital	Fixed capital	Debenture and other loans
	yen	yen	yen	yen
1922	2,124,047,000	1,507,946,000	1,686,463,000	415,325,000
1927	3,524,199,000	2,677,153,000	3,667,387,000	1,506,040,000
1932	4,174,738,000	3,326,834,000	4,888,175,000	2,494,049,000
1933	4,511,663,000	3,454,202,000	5,194,702,000	2,306,268,000

Digitized by Google

The rate of profit earned is as shown in the following table:

PROFITS OF ELECTRIC INDUSTRY 1922-1932

Year	Paid-up capital	Profit	Rate of profit against paid-up capital
	yen	yen	yen
1922	1,507,949,000	188,295,000	12.0%
1923	1,703,195,000	192,212,000	11.0
1924	2,012,205,000	217,249,000	11.0
1925	2,218,649,000	252,977,000	11.0
1926	2,453,588,000	279,331,000	11.0
1927	2,677,153,000	279,541,000	10.5
1928	2,868,717,000	282,880,000	10.0
1929	3,019,222,000	301,900,000	10.0
1930	3,180,810,000	255,800,000	8.0
1931	3,234,181,000	227,061,830	7.0
1932	3,326,534,000	195,997,000	5.9
1933	3,494,202,000	183,100,000	5.2

Gas Industry

Introduction

When compared with the electric industry, the gas industry has been very slow in its development. The introduction of gas took place in 1885, when it was used in Yokohama for street lighting purposes. Later in the same year Tokyo adopted it for the same purpose. The capital invested in 1885 was ¥54,000, and a slow but steady increase took place until 1925, when the invested capital stood at ¥276,373,000. After that year the industry made great strides as the following figures show:

End of	Material Consumed	Supply			Consumption	Motors	
	Coal	Output	Amount Supplied to Consumers	No. of Consumers	No. of Lights and Burners	Number	Horse-power
	Metric ton	Thousand cubic metres	Thousand cubic metres				
1917	658,530	226,209	229,501	549,565	2,455,241	1,703	531,885
1918	735,161	259,892	261,371	505,401	2,364,394	1,531	414,815
1919	718,574	277,096	275,212	530,061	2,182,307	1,469	13,141
1920	727,705	293,414	294,544	492,214	2,195,782	1,184	11,455
1921	718,271	305,666	306,470	502,828	2,234,623	966	9,938
1922	761,262	345,240	347,261	552,367	2,353,674	867	9,415
1923	707,226	329,017	326,517	463,745	798,032	699	7,058
1924	727,314	353,266 * 37,288	352,952	568,477	1,606,096	559	6,616
1925	781,911	354,362 * 36,605	408,418	683,087	1,865,183	497	6,648
1926	904,087	444,390 * 42,580	423,032	795,226	2,043,829	429	6,638
1927	1,036,552	496,810 * 68,096	486,911	953,688	2,234,722	358	6,524

Present State of the Business

General Aspects The difficulty of disposition of by-products which was a stumbling-block to the development of the gas industry disappeared along with activities in heavy and chemical industries, and the industry's policy to increase demand through lowering the price of gas came to reap its fruits. In fact, the gas industry may be said to be developing with the prosperity in cities which is caused through inflation. On the other hand, the higher prices of coal and steel are making both production and construction costs higher.

Demand on Gas The demand for gas is making a steady increase every year. Working results of five large companies in 1933 and 1934 were as follows:

PRODUCTION OR SALES OF GAS BY FIVE LEADING COMPANIES

Name of Co.	(In 1,000 cu.m.) 1933	1934	Percentage of increase in 1934
Tokyo Gas	402,248	415,500	4.3%
Toho ,,	85,970	86,421	1.3%
Kyoto ,,	39,354	40,522	3.0%
Osaka ,,	115,243	133,235	15.6%
Kobe ,,	40,255	43,715	8.6%
Total	633,070	669,397	5.7%

Figures show 5.7 per cent. increase over 1933. The abrupt increase in Osaka and Kobé in 1934 is due to ordinary increase in number of consumers as well as to the damages caused by the typhoon of that year. Owing to improvements in various gas appliances, gas is now used in a very economic way so that the consumption of gas per meter is decreasing. The increase in demand is therefore solely due to increase in number of consumers.

Higher Cost of Production The biggest problem for gas producers in 1934 was the higher prices of coal and steel, the former having relations with the cost of gas production and the latter with expansion of the industry. The price of coal rose from ¥8.10 per ton in 1932 to ¥12.32 in 1934. As the contract for the purchase of coal runs generally a year, the result of the purchase generally appears in the following year. From the above figures, therefore, the production cost of gas in 1935 will be about 50 per cent. higher than that for 1933, and the price of coal has now become a subject of great importance to the gas industry.

Fortunately the prices of coke and other by-products rose owing to increased demand on these from heavy and chemical industries, and this enabled producers to make good in 1934 the disadvantages caused by the higher price of coal. However, the income from gas which occupies about 70 to 80 per cent. of the total income is fixed and cannot be increased under the present system. Though the increase in the price of coal may also increase the price of the by-products, whether the latter can cover in 1935 the loss caused by the former remains still to be seen.

The average price of bar steel in 1932 was ¥67, which went up to ¥96 in 1933, and to ¥100 in 1934. The burden which came from the higher price of steel materials was not as serious as that of coal. Especially as this came about after most of the producers had completed new expansion works, the degree of pressure which it brought to bear upon the business of producers was comparatively small.

Industry in 1933 According to figures published in 1934, the number of gas enterprises in 1933 was 102 opened and 14 unopened. As compared with the previous year, the number opened increased by 2 while the number unopened decreased by 1.

Digitized by Google

95 of the opened are private enterprises while 7 are the city-managed. Again, 87 of them are exclusively engaged in gas while those jointly engaged with electric industry numbered 15, of which 10 were of private, 1 the city-managed and 4 managing with various kinds of enterprises. The formation of capital of the industry in 1933 and 1934 is as shown below. The reason that the capital increased in 1934 was due to establishment of new companies and payment of unpaid capital. In the capitalizatidn columns the investment in the electric enterprises is included and the real capital invested in purely gas industry is estimated to run from ¥273,000,000 to ¥280,000,000.

BUSINESS RESULTS OF GAS COMPANIES

(In ¥1,000)

March	Paid-up Capital	Fixed Capital	Profit	Percentage of profit against Fixed Capital	Dividend rate
1930	350,282	459,686	48,874	9.2%	9.6%
1931	382,980	555,614	50,896	9.0	8.7
1932	395,632	571,564	51,452	8.7	8.3
1933	400,908	580,053	50,317	9.1	8.0
1934	419,096	584,328	53,029	9.1	7.8

Warehousing

History

Since warehousing depends on the storing of large quantities of goods, transportation facilities are the factors which influence its success, an expansion of one calls for an expansion of the other and, in Japan, it was the development of transport facilities in the days of Meiji which gave rise to the modern warehousing business.

Warehouses of kinds have always existed. Emperors in olden times kept rice and cereals in warehouses for military purposes. Later, cereals were kept to provide for relief of the people in case of poor crops, but in either case, the warehouses were used for military or political, not commercial, purposes. When the Tokugawas came to rule the country as Shoguns about three hundred years ago, both Yedo (present Tokyo) and Osaka became great cities where trade and commerce flourished. Transportation by sea developed, and many feudal lords came to reside in these cities, bringing with them, or having sent to them, the agricultural products of their country districts. The produce was stored at the lords' residences, which became, in a sense, public warehouses. The produce was sold by public tender and to the successful bidder a memorandum was given against receipt of payment in cash. This memorandum was equivalent to the warehouse receipt of the present day, and the holder of the memorandum was authorized to keep his cereals in the warehouse for the time stipulated on it. Loans were often raised with memoranda as collaterals.

After the Restoration, owing to development of commerce and activity in the movement of goods, many warehouse businesses were started, the first company, to operate on a modern basis being the Soko Kaisha in Fukagawa, Tokyo, established in 1881 with a capital of ¥65,000. Dissolution took place 3 years later. In Osaka, the Konoiké family organized the Osaka Soko

Digitized by Google

Kaisha with a capital of ¥200,000 in 1882. In 1883, the Sanbashi Kaisha in Kobé, and in 1884, the Otsu Soko Kaisha in Otsu in Miyé prefecture, were established. In 1886, the Tokyo Soko Kaisha, Ltd., was founded by the Iwasaki family. After that year there was no great change until after the Sino-Japanese War, when, with increased foreign trade and improved transportation facilities by land and sea, the number of warehouse companies rapidly increased. In 1906, there were 536 people engaged in the warehouse business, either on private account or on an incorporated basis.

Present State of the Business

The Area At the end of 1934 the number of warehouse managements which belong to the Japan Warehouse Association and which are located in principal cities is 107, and the total area covered by them is about 189,000 tsubo, with the commodities valued at ¥661,809,000. However, there are many warehouse managements, incorporated or otherwise, which do not belong to the Association. According to an investigation made by the Department of Commerce and Industry, the number of warehouse managements in the country totalled 578 in 1933, which owned 4,934 warehouses covering an area of 681,966 tsubo, besides renting 1,310 warehouses, the area of which totalled 136,012 tsubo. These warehouses are of various types, some of them being of reinforced concrete, some of brick or stone, some of iron frame and tin plates, some of storehouse type, while others are merely zinc sheet covered or of wood.

Value of Commodities The values of commodities stored in the 107 warehouses above mentioned were as follows:

VALUE OF BALANCE OF STOCKS IN WAREHOUSES

(unit ¥ 1,000)

	1921	1931	1932	1933	1934
Balance at the beginning of the year	855,260	356,844	409,988	485,987	585,085
Balance at the end of June	545,471	458,917	546,683	629,965	775,846
Increase or decrease during the half-year	*309,789	102,073	145,690	143,978	190,761

* Decrease

The figures for 1921 are given here to show that the stocks accumulated after the great slump in 1920 have been cleared away. Scarcely any stocks are kept for the purpose of speculation. When studied in conjunction with the following table the decrease in value indicates that not only has the quantity of goods decreased, but the price level in general is lower.

BALANCE OF STOCKS IN WAREHOUSES IN NUMBER OF PARCELS

(a) 108 storage plants in Mar. '35. (b) 42 storage plants in Tokyo, Osaka, Kobe, Yokohama Shimonoseki-Moji and Nagoya. Figures for July, 1933, and thereafter include those for Nagoya.

Insurance All warehoused goods are insured against fire. At present, the custom in Japan is that the warehouse companies become, on their own account, insurers of the goods for the customers, who, therefore, get the benefits of insurance without going to the trouble of insuring them themselves, a custom which differs from that in Europe and America. According to the Japanese system, therefore, when the warehouse companies issue warehouse receipts, they are required by law to insert the fire insurance clause in the receipts. Accordingly, transactions made through warehouse receipts will also settle questions connected with fire insurance, a system not followed in Europe and America.

Without the insurance system it would have been next to impossible to give such adequate statistics as are contained in the above tables, which are the balances of outgoing and incoming goods as entered in the account books of the above-mentioned 96 warehouses and published as totals by the Association of Japanese Warehouse Companies.

Storage Charges Storage charges are calculated on a combined ad valorem and weight basis. Therefore, when the price of an article declines, the storage charge declines also. Different ad valorem rates exist for different classes of goods and the same is true of the charges by weight, the extent of responsibility of the warehouse company and the importance of any particular goods to the public at large being taken into consideration. For instance, rice is a necessity of life for the Japanese, so the rate is very low. For weight or measurement goods are divided into 60 classes.

Characteristics of the Business

In Japan, there are numerous warehouses called "producers' warehouses." Actually, such warehouses are agricultural produce storehouses, places where seasonal commodities can be collected and stored until the market can absorb them at fair prices. The farmers are thus protected and assistance can be rendered them through the arrangement of credits, a duty undertaken by the warehouses. Besides protecting farmers from severe economic competition the warehouses are valuable nationally for promoting the policy of self-support and sufficiency in foodstuffs. Rice and cocoons are the chief commodities handled,

Warehouse Business in 1934

Owing to great industrial activities, movement of commodities by railways was very brisk, which was also reflected in receipt and forwarding of commodities by warehouse companies. According to an investigation made by Japan Warehouse Association, the receipt and forwarding of commodities by warehouse companies in six leading cities in 1934 showed 14 per cent. increase in units in receipts as compared with 1933 (value decreased by 1 per cent.), while outgoing commodities increased 17 per cent. (value decreased by 0.2 per cent.). The following table shows the conditions of business :

AMOUNT OF COMMODITIES WHICH WERE RECEIVED AND FORWARDED BY WAREHOUSE COMPANIES IN SIX LEADING CITIES

(In 1,000 units and ¥1,000,000)

CHAPTER XXI

FOODSTUFFS

Wheat Flour

Historical Survey

Before the Russo-Japanese War It was not until after the Russo-Japanese War (1904-5) that the wheat flour industry made any progress in Japan. Prior to the war there was a fairly large consumption, but manufacturing was only in the infant stage, most of the production being with the help of water-wheels. The daily output by this method was only 10 to 50 or 60 bags; the quality was poor and not uniform and, being packed in straw bags, the product was not at all satisfactory. It was only in the year 1895 that wheat flour was first produced on a modern basis by machinery. In that year, the Nippon Seifun Kaisha, Ltd., began to operate mills with a capacity of 200 koku per day, and gradually, mills with capacities of 50 to 100 koku a day were established, but progress was very slow. However, the demand for flour increased and as production could not keep pace with it imports naturally increased. In 1895, imports were 280,000 bags, valued at ¥400,000, ten years later imports had increased to 4,990,000 bags, valued at ¥9,950,000. Imported and water-mill produced domestic flour together satisfied practically the whole of home consumption, while domestic flour made by machinery formed but a very small part of the supply. The imported flour coming chiefly from the United States of America, was of a far superior quality to the home product.

Yield of Wheat Before 1901, the land used for wheat planting averaged between 440,000 and 480,000 cho, and in 1905, it was 450,000 cho. The yield of wheat gradually increased up to 1901, when it was 4,370,000 koku, but during the next few years there was a gradual decrease until in 1905 the yield was 3,600,000 koku.

As regards imported wheat, the amount imported usually depended upon the domestic wheat crops, but showed in general a gradual increase. In 1895 imports were only 1,600 koku with a value of ¥7,500. In 1902 they had increased to 38,000 koku, valued at ¥240,000. The year 1903 proved to be a lean year for domestic wheat, and imports suddenly increased to 560,000 koku, of a value of ¥4,760,000. After that, owing to the prosperity which visited Japan after the war with Russia, wheat continued to be imported in large quantities. In 1904 it was 170,000 koku, valued at ¥1,530,000, and in 1905, 450,000 koku, valued at ¥4,000,000.

After the Russo-Japanese War Many flour mills were established on a modern basis during the time of the great boom which followed the Russo-Japanese War, and production capacity was greatly expanded, but a contraction was brought about by the closing down of many of the newly established mills when the reaction later set in. In 1914, when the World War started the capacity of production by machinery was 9,060 barrels and this, by 1922, had increased to over 20,000 barrels.

Digitized by Google

During those seven years the industry experienced unprecedented prosperity, and with this development on modern lines, domestic producers who make flour in the old-fashioned way have lost nearly all their customers and, further, imported flour has been practically shut out of the country.

The Industry at Present

Production and Imports of Wheat After 1918 the demand for wheat flour, keeping pace with the advance in the standard of living, greatly increased. The extended westernization of the country in recent years largely accounts for this and has brought about a consequent heavy demand for wheat. Home production has not increased to meet the demand, the result being, as the following tables show, heavy annual importations of wheat. An attempt, therefore, has been made by the Government to increase domestic production through tariff and increase of wheat acreage, in which they were highly successful. The production increased very much in 1933 in proportion to the increased acreage, which was further accelerated in 1934, as the following table shows :

PRODUCTION OF DOMESTIC WHEAT AND ITS ACREAGE AFTER 1924

Year	Production koku	Acreage cho
1924	5,268,000	469,000
1925	6,121,000	468,000
1926	5,897,000	467,000
1927	6,059,000	473,000
1928	6,389,000	489,000

1934	17,820	0	2,220,803	1,325,549	4,455,025	135,864	8,155,061

The United States anticipated a crop failure in 1934, which was undoubtedly a bullish factor for the wheat market. Moreover, President Roosevelt's efforts to bring back prosperity had a good effect on wheat price. But the stock of wheat was so large that it still acted to check the rise of price. Accordingly the United States made an agreement with China to sell wheat and cotton, which was not, however, carried into effect on account of anxiety felt as to the payment. Thereupon, the United States sold the wheat in Japan. The quantity so dumped totalled about 100,000 tons, the shipments of which arrived toward the end of May and thereafter. Owing to great increase of domestic produc-

Digitized by Google

tion of wheat, the import of wheat from countries other than the United States decreased to a considerable extent.

The Export of Wheat Flour . The export of wheat flour in 1917 was as large as 4,410,000 bags, and 2,560,000 bags in 1918, but this was only a temporary war-time phenomenon. After the latter year exports fell away sharply and it was not until 1925 that exporting on a steady basis really began.

EXPORTS OF WHEAT FLOUR

Countries to which exported

(Quantities in piculs)

Year	Manchoukuo	China	Kwantung Province	Dutch Indies	Asiatic Russia	Others	Total
1923	—	—	—	—	10,480	163,020	173,500
1924	—	79,903	6,875	3,833	30,155	12,875	187,641
1925	—	405,841	518,299	8,408	10,102	206,158	1,148,803
1926	—	907,565	653,947	48,536	4,413	78,111	1,692,572
1927	—	938,934	200,234	30,156	7,250	75,113	1,251,687
1928	—	1,763,898	536,245	24,538	23,647	24,001	2,372,329
1929	—	1,786,880	1,086,880	16,571	153,068	19,979	3,063,378
1930	—	1,337,437	378,057	21,595	229,625	32,044	1,998,758
1931	—	1,684,775	490,162	14,068	19,390	33,616	2,252,011
1932	858,103	1,049,163	2,572,327	5,998	—	27,395	3,694,883
1933	1,427,036	482,700	803,963	14,068	—	63,006	5,304,249
1934	1,402,032	17,183	2,899,819	8,988	31,081	68,320	4,427,819

Exports in 1932 showed the highest figure up to that time, exceeding the figure of 1931 by 1,443,000 piculs. The Tsurumi Mill of the Nisshin Seifun Kaisha, Ltd., the largest mill in the Orient, was destroyed by fire in 1931. In 1933, aided by the fall in yen exchange and the Tsurumi Mill again coming into operation, the year showed even better results than 1932. In 1934, however, the figure showed a slight decline owing to the sales by the Australian exporters at Dairen, which checked the export of Japanese flour to Manchoukuo and Kwantung Peninsula.

FLOUR PRODUCTION, CONSUMPTION, ETC.

(in bags)

Wheat Encouragement Policy

The great development of flour milling industry and the shortage of domestic supply of wheat increased the import of foreign wheat to a tremendous extent. For a long time it was studied to check the import of wheat. It was proposed later that to attain the purpose, the best way would be to increase domestic production through increase in wheat acreage, with the goal of making Japan self-sufficient as to the supply of wheat. With this in view, when tariffs were revised in general in 1932, that on wheat was raised from ¥1.50 to ¥2.50 and that on flour from ¥2.90 to ¥4.30 per 100 kin each. Moreover, it was estimated by the Ministry of Agriculture and Forestry that Japan's annual requirement of wheat was about 9,000,000 koku, 5,000,000 koku of which was used as flour while balance of 4,000,000 koku for brewing and other purposes. The Government, therefore, determined to increase wheat production to this figure. They encouraged rice farmers in 1932 to turn over their land to wheat production, figuring on a five year drive, and the Government's goal was reached in three years instead of five. Wheat crop amounted in 1934 to 9,450,000 koku against 8,006,000 koku of 1933, and showed an increase of 41.6 per cent. over the average of preceding five years. The acreage was 648,400 cho against 615,888 of 1933. Its increase over the average of preceding years was 24.4 per cent.

The fact that tariff was raised and Japan has become self-sufficient in wheat gives a new advantage to Japan. In the past, Japan had to buy most of wheat in foreign markets. Prices always were subject to fluctuations according to conditions in foreign markets, and it was not always convenient to hedge purchase made in this country. In fact, for many years the business of flour milling was handled as if it were a speculation and the near-failure of the Nihon Flour Company, Ltd. (in the days before the Mitsui Bussan Kaisha, Ltd. assumed control of it) was entirely due to gambling in wheat. Now this danger of speculation has been entirely wiped away from the business. Domestic wheat, most of time, is well within the tariff walls, and is not very much affected by foreign influences now.

1934 Business

Trend in General The flour industry passed a prosperous year in 1934. Due to general anticipation of crop failure the price of wheat was high the world over, along which the price of flour also. On the other hand, owing to the higher price of rice, the domestic demand on flour was good, while in the latter half of the year the export to Manchoukuo and Kwantung Peninsula increased. The increase in demand resulted in the increase of wheat production and flour mills made a good business.

Wheat Market Owing to the short crop of wheat the world over, quotation at Chicago market was strong, which was reflected in the domestic market. Though the price declined temporarily during the spring due to the sales of wheat by America, the market soon picked up and the price was firm in general.

Production and Consumption Production of flour gradually increased throughout the year, and in the latter part of the year, over 3,000,000 bags a month was produced. Owing to record making increase of export in the period, mills operated at full capacity. The causes of these increases are not far to seek. The demand on flour increased due to the higher price of rice, and export expanded in the latter half of the

Digitized by Google

year. As the result of this, the stock of flour which was more than 100,000 bags was at the beginning of the year reduced to about 50,000 bags. The total production in 1934 is estimated at 45,966,000 bags.

Though the price of wheat was high next to 1933, flour mills were able to make profit on account of increased demand and higher price obtained for flour. The average wholesale price of wheat flour per bag (5.9 kwan) both in Tokyo and in the whole country was ¥3.28 against ¥3.50 of 1933.

Decrease in Export Manchoukuo and Kwantung Peninsula are two principal markets for Japanese wheat flour. Owing to the sales by Australian millers at Dairen, which amounted to from 1,000,000 to 1,500,000 bags a month, export by the domestic mills to these markets were curtailed by that much. The Japanese millers cannot compete against foreign flour if the domestic wheat is used as raw material. They, therefore, store the imported flour in bond and use it as raw material for export purpose. On account of the higher price of foreign wheat in earlier period, this was impossible to do and hence the decrease in export.

However, in the latter half of the year, the Australian sales at Dairen were over, while the shipment of American wheat arrived, and the domestic mills recovered what they lost in the first half by milling these low-priced American wheat and exporting it. With the export of 29,000,000, kin in July as the bottom, export steadily gained, that in December amounting to as large as 59,000,000 kin. The total export during the latter half amounted to 260,000,000 kin and showed a gain of 20,000,000 kin as compared with the corresponding period of the year before. But owing to the severity of competition of the Australian exporters at the earlier period, the total export to these markets in the whole year was 440,000,000 kin which showed a decrease of 87,000,000 kin.

Sugar

History and Development

The art of making sugar was imported from China about two hundred years ago, but no great progress is recorded in its manufacture until after the Restoration, and even then it remained as a farmers' sideline until the end of the Sino-Japanese War of 1894-5, when Formosa, well-known for its sugar production, was ceded to Japan by China. This marked a new era in the sugar industry. In 1896, a sugar refining company was organized in Osaka and from that time the industry began to develop.

The Government undertook to levy a duty on raw sugar in 1899, and, by successive steps, this duty has reached the present rate. In 1911, a tariff of a similar nature was imposed, for the first time, on refined sugar.

In view of the fact that Formosa is ideal both in temperature and rainfall for cane growing the Government decided to encourage the establishment of sugar mills in the Island. With this in view it established the Temporary Sugar Bureau as a branch of the Government of Formosa. The Bureau subsidized sugar companies in establishing sugar mills and pur-

Digitized by Google

chasing required machinery. It imported cane seedlings and distributed them to cane growers. It gave, too, subsidies for the purchase of fertilizers, and in various other ways succeeded in dispensing as subsidies, up to 1924, a sum amounting to more than thirteen million yen. As the result of these subsidies, the industry has developed to the present stage. In 1902, the production of raw sugar in Formosa was only about 600,000 piculs, but by 1931 this had increased to over 13,000,000 piculs.

In 1901, the Taiwan Sugar Co., Ltd., was organized. Raw sugar mills with all new machines were established and war was declared against the old-fashioned machines which were only able to produce poor red sugar. Development was destined to be slow, for the plantations and mills were subject to attacks from the native savages, but this difficulty was gradually overcome and during the prosperity that visited Japan after the Russo-Japanese War, many new companies were organized and the industry developed rapidly.

Present State of the Industry

The sugar industry in Shikoku, Kyushu, and the Loochoo Islands is making no headway, but that in Formosa, is rapidly progressing, and at present it is the Formosan sugar that controls the sugar market in Japan. Refining is making good progress in Japan proper.

PRODUCTION OF SUGAR

(Unit 1,000 piculs)

Year	Formosa	Japan Proper	Hokkaido	Korea	South Sea Islands	Total

* Estimate

Before 1926, the total production of sugar was only about 10,000,000 piculs. But after that year production rapidly increased, and in 1933-34, it had reached over 18,032,000 piculs, about twice as much as six or seven years ago. The increase came chiefly from Formosa, and is due to the advance in agricultural method, viz., the planting of superior canes, prolongation of the time of planting, improvements in ploughing, etc. As the result of this increase in yield, imports of sugar have been considerably reduced, but the balance between demand and supply has been destroyed which became the cause of anxiety for sugar

Digitized by Google

industry. However, owing to restrictions placed on the output of sugar not only in Japan proper, but also in Formosa and the South Sea Mandated Islands, the output was curtailed. Moreover, import was reduced considerably so that the balance between the demand and supply was restored, and the industry was quiet until 1934. It is feared, however, that the 1934-1935 production, which is estimated as large as 18,880,000 piculs may nullify all these efforts in the past.

TABLE SHOWING CONSUMPTION OF SUGAR

(Unit 1,000 piculs)

Year	Japan Proper	Formosa	Korea	South Sea Islands	Total
1918	7,375	410	—	—	7,785
1919	8,148	302	170	—	8,621
1920	6,722	235	149	7	7,114
1921	10,199	326	291	19	10,837
1922	11,280	317	175	3	11,777
1923	10,562	363	276	21	11,223
1924	11,162	351	209	58	11,781
1925	11,690	520	262	148	12,621
1926	12,674	551	315	152	13,694

1930	12,949	688	340	313	14,292
1931	13,461	662	333	1	14,459
1932	14,310	671	350	1	15,332
1933	13,936	684	350	1	14,971
1934 (estimate)	—	—	—	—	15,300

Japan's consumption of sugar showed an increase during the 1934 calendar year, reaching a figure which broke all records except that of 15,332,253 piculs set in 1932.

In the past Japan has been generally a self-supplying country, having either only a very small excess of import or export. Even 1934-1935 production, which is considered very large in Japan and is estimated to amount to 1,333,000 tons, will be only 4½ per cent. of the world total production, which is estimated at 25,165,000 tons. Her per capita consumption only slightly exceeds the international average of 22 kin per year, that in 1934 being 23.98 kin. The increase in Japanese consumption of sugar follows :

JAPANESE PER CAPITA CONSUMPTION OF SUGAR

(in kin)

Year	Annnual per Capita Consumption
1912	6.22
1917	10.49
1922	19.57
1927	20.07
1928	21.27
1929	21.86
1930	20.57
1931	20.59
1932	20.59
1933	20.73
1934 (estimate)	23.98

Tables for exports and imports of sugar are given below. In spite of all political troubles China has always been the best market for the Japanese production. The figures for 1932 declined abruptly, but this was due to the Manchurian Incident, and the loss of Manchuria

Digitized by Google

which was itself a good market. If figures for Manchoukuo, Kwantung Peninsula and China are added together, it will be found that there has been no really great change as might otherwise seem indicated.

Imports from Java Since some of Japanese sugar companies are refiners rather than planters they buy crude sugar wherever they can get it at the lowest price. Often the Javanese sugar is more reasonable in price and hence usually the import of sugar from there. This was the situation in general until 1931. Domestic producers could not compete and had a hard time making profits, for the Javanese sugar kept entering the country at lower prices. The situation changed somewhat with the reimposition of gold embargo, which caused the decline of yen. The establishment of a new import tariff served to change the situation further. Since then the Japanese sugar was protected to a certain extent against the import, the producers were planning to curtail production. Prices soared remarkably. Plans to reduce production costs were taking effect. Per picul cost of the leading companies dropped from ¥7 in 1931 to ¥5 in 1932, while domestic sugar quotations rose from ¥7 in October, 1931, to ¥14 in September, 1932, elevating earnings per picul from zero to between ¥8 and ¥9 a picul, and in this manner the sugar industry experienced its boom in 1933.

The boom, however, does not seem to have been destined to last long. The international over-supply of sugar, the constant threat that the Netherlands may abandon the gold standard, public criticism against the sugar companies due to recent consumption tax evasion case and the resultant public cry for the abolition of the tariff protecting sugar are all unfavourable factors for the sugar industry. These causes acted to keep raw sugar prices from going up. Since the boom in 1933, the price has been steadily downward. It should be noted, however, that the conditions are not very bad ; only forebodings for the future are keeping down prices of sugar.

SUGAR EXPORTS AND IMPORTS OF JAPAN

Refined Sugar At present there are fifteen refineries in Japan proper and one in Korea. The total refining capacity is about 2,800 tons per day, so that if the average working days per year are 300, production will be about 14,229,600 piculs a year. Against this only a little over 6,900,000 piculs of refined sugar are produced, hence there exists a great surplus capacity.

1934 Sugar Business In looking over the condition of consumption in 1934, the stock at the end of the year was 828,000 piculs, which was one-third of 1933, and conditions of demand and supply remarkably improved. This was mainly due to the enforcement of curtailment of production in 1932-33 and 1933-34, and also the increased consumption in the early part of the year.

The record production in 1931-32 year destroyed the balance of demand and supply, and the situation was relieved through hard efforts to curtail production, sacrifice exports of surplus sugar, etc. as has already been explained.

DOMESTIC PRODUCTION

(in 1,000 pcls.)

Beet sugar (Korea)	29	—	—
,, ,, (Hokkaido)	405	402	383
Total	19,266	13,406	13,437

The market opened in 1934 rather weak, but after signing of sugar supply agreement October, 1934, its tone became stronger. When Japan-Dutch East India Conference was opened, the market became weak again as it was feared that the Conference would fail. Toward the close of the year the price rose due to the delay in marketing of new product.

AVERAGE WHOLESALE PRICES OF SUGAR in 1934

(Quotated in yen for every 100 kin)

Month	Refined Sugar	Contrifugals
January	19.76	17.51
February	20.44	17.90
March	20.09	18.00
April	19.60	15.90
May	19.36	15.38
June	19.68	15.43
July	20.67	15,73
August	21.50	16.32
September	22.70	17.07
October	22.34	17.23
November	22.30	17.34
December	22.55	18.01
Average of the year	20.92	16.82

Belgium's departure from gold in the early months of this year created a sensation among sugar men of Japan, for all fear that the Netherlands will follow suit. If the Dutch should quit the gold standard the guilder would fall and the result would be that Javanese sugar could enter Japan more easily.

The yen-guilder rate on April 10, 1935, was 41.75 per ¥100. If the Dutch exchange should fall 25 per cent. the rate would drop to 55 guilders. A decline of 30 per cent. would make it 60 guilders. Prices of Japanese sugar are more or less controlled by the import prices of Javanese sugar and a drop of the guilder would automatically lower prices in Japan, which is a cause of apprehension in the country.

Various Sugar Companies

The following table shows capacities, standings, etc., of the principal sugar companies in Japan as of March, 1934:

CAPITAL, CAPACITIES, ETC., OF SUGAR COMPANIES

Company	Capital		Capacity		Production of Sugar (1933-34)
	Authorized	Paid-up	Raw sugar	Refined sugar	
	in yen	in yen	in long ton	long ton	pcls.
Taiwan Seito Co., Ltd.	63,000,000	43,080,000	10,548	430	2,800,000
Dai-Nippon Sugar Co., Ltd.	51,416,000	45,779,100	8,320	910	2,081,825

Brewing

Beer

Historical Beer was brewed in Japan about 80 years ago by a certain scholar, Mr. Ko Kawamoto, who, as he learned how to brew it when he visited Admiral Perry's fleet, on the latter's visit to Japan, tried to brew on his own private account. In 1870, beer was brewed for the first time on a modern industrial basis by an American, Mr. Gobland, in Amanuma, Yokohama. Four years later, Marquis K. Kuroda saw that the soil of Hokkaido was particularly suitable for barley, so he established a brewery in Sapporo, and soon others were built in Meguro, Tokyo, in Suita, Osaka, in Hodogaya, Yokohama, and other places, and the industry has so developed that at present Japan has six beer brewery companies and fourteen breweries with a total capacity of about 1,500,000 koku.

Production and Consumption In order to show how this industry has developed in Japan we give below figures of beer brewed during the last two decades.

Digitized by Google

Year	Production of beer (in koku)
1912	196,404
1915	248,818
1918	511,525
1921	656,174
1923	805,905
1926	767,583
1927	795,385
1928	904,877
1929	895,945
1930	846,014
1931	797,544
1932	779,283
1933	959,762
1934	970,494

Consumption of beer in 1912 was only 3.25 go (one go is equivalent to 0.18039 hl., about one-third of a pint) per head, but this had increased to 10.16 go in 1923 and to 13.53 go in 1929.

As regards the capacities of different breweries, five of them brew more than 150,000 koku, 3 over 100,000 koku and 2 over 30,000 koku per year.

Though any hasty conclusion cannot be made, since the number of breweries is very small, it is presumed that in future a capacity of at least 100,000 koku should be made a unit for any establishment. The brewing of beer differs from the brewing of Japanese saké in that it does not require much personal skill. It can be brewed on a large scale in a mechanical way, and as the brewing is done in this country in the German style, it requires large mechanical equipment, hence, large capital. Judging from the past, the brewing of beer in Japan will in future be carried out on a very large scale.

The Japanese taste for beer originated in the taste for saké. Originally, people who were used to the Japanese liquor shifted their taste from saké to beer, or, drank both. Nowadays, beer has become so popular that the people go to it without the agency of saké, and this tendency will be accelerated in the future. In recent years the mode of living of the Japanese has been westernized to a very great extent, and especially with improvements in the heating arrangements of houses and the extreme westernization of food has the taste of the people for beer been intensified. Moreover, with the advance of knowledge about hygiene, the middle-class people seem to give a preference to beer, which contains a smaller percentage of alcohol than saké.

Japan as Beer Consuming Country In spite of the increase in consumption, Japan still occupies an insignificant position as beer producer and consumer in the world. Her production of about 1,000,000 koku in 1933 stands at the fourteenth in the list of beer producing countries with the U.S.A.'s 27,000,000 koku as the first. Also her per capita consumption of 2.77 litres was the twenty-eighth in the list of beer consumers with Belgium's 176.46 litres at the head. This is easy to explain. Most of her people take saké, the production of which is about 4.5 times as large as beer. Saké is the standard of drink, only a very small quantity of which is enough for average man. In other countries, beer is a staple, an article of food. But in Japan it is something of luxury, reserved for the people of middle and upper classes. A bottle of beer, which contains about one-fifth of a gallon of beer, sells about at 50 or 60 sen, which is too high for average Japanese farmers or wage-earners. If the Japanese of these classes take as much beer as the Belgians do they would spend greater portion of their income on beer.

Exports and Imports Exports of beer in recent years follow:

Dutch India	2,828	234	8,856	535	29,944	1,639	4,209	225
Others and total	36,637	3,034	68,812	4,835	132,373	7,684	118,009	5,535

In spite of the fact that beer which was exported has been exempt from brewing tax since 1912, the export has not been very encouraging. During the Great War, export temporarily increased, due to England and Germany having neglected their Oriental markets, but with the return of peace their attention was again directed toward the East and Japan's export there fell off with it. Since then the export fluctuated between 23,000 and 53,000 koku. The decline of yen has given the export business an importance it never had before, and in 1933 the export totalled 68,812 koku, the largest since 1918. In 1933 the export amounted to 132,373 koku, valued at ¥7,684,000. Relegation in the U.S.A. gave a great spur, the export to that country including Hawaii amounting to ¥537,000. But the export to America proved but temporary; it sharply fell off in 1934. As a whole the 1934 export showed a slight decline as compared with 1933, which was due to the smaller British India and the Dutch East Indian markets. In the latter the Government took steps to end imports from Japan, which reduced the export to that country drastically. On the other hand, exports to Manchoukuo and Kwantung Peninsula increased, so far the latter proving as the best market for Japanese beer abroad. Demand in Manchoukuo is steadily gaining, but owing to the establishment of the Manchurian Beer Company, Ltd. export to that country is bound to decrease in future.

Production Capacity Production capacity of breweries was 1,090,000 koku in 1922, which steadily expanded. The increase of capacity was especially marked after the Great Earthquake of 1923, and consumption of beer could not keep pace with it. It increased to 1,700,000 koku in 1931, while actual production was barely 740,000 koku, and it was further increased up to 1,830,000 koku. When the industry was in chaotic conditions during the time of depression, which was made worse by the competition among brewers, this over-expanded capacity proved a great weakness of the industry. The production was curtailed then to the extent of 55 per cent.

Production of Raw Materials The principal raw commodity for brewing beer is barley. This, until recently, was mostly imported, but at present it is being grown in various parts of the country through the brewers making contract with village and town agricultural associations. In this manner about 300,000 koku, which is about the quantity required by the brewers, is being produced annually, and as most of the breweries have their own equipment for converting the barley into malt the necessity of importing either of these materials is obviated.

Digitized by Google

However, the quantity of barley now raised yearly may prove insufficient if the demand for beer increases to any great extent and supplies will then have to be obtained from abroad.

Another important raw material is hops. Though several attempts have been made at different times to grow them in this country the yield has always been very small, and reliance has to be placed on foreign supplies.

The Beer Industry in 1934 The beer industry gives an evidence that not all the branches of industry were benefited by the expansion of the heavy industries and lower exchange. Production of beer showed but slight increase and its export declined. The loss was chiefly caused by election of mills in Korea, though the output of these mills was slightly smaller than the reduction in production in Japan proper. Beer did not clearly join the upward swing of other industries.

The beer industry was almost under complete control before 1930, prices until then being fixed by three influential mills, which were the Dai Nippon, the Kirin and the Nippon Beer Kosen. The last named withdrew from the agreement in the spring of 1930 with an intention to take a larger share of business through underselling, and for the time being the control was lost and the industry was in perfect chaos. In June, 1933, the Joint Sales Company of Beer was established with a view of establishing sales quotas and prices for the Dai Nippon and the Kirin. As a preliminary to this arrangement the Dai Nippon Beer absorbed the Nippon Beer Kosen.

The year 1934 was the first year after the Joint Sales Company of Beer was established. The influence of the cartel was evident. There was no competition ; sales was good, though somewhat smaller than 1933.

As regards exports, America did not buy as much as expected, while the Dutch East Indies which bought 30,000 koku in 1933 took only 4,000 koku due to import restriction. On the other hand, exports to Manchoukuo and Kwantung Peninsula increased and exports, as a whole, decreased 14,000 koku.

The Dai Nippon Beer Co., Ltd. established the Tokyo Beer Co., Ltd. capitalized at ¥1,500,000 on joint account with Kotobukiya Co. in January. In the same month sales agreement was arrived at with the Sakura Beer Co., Ltd. which was the only outsider to the cartel. In this manner, the domestic market was placed under complete control of the cartel. On the other hand, export is under control of Teikoku Beer Export Guild, so that the control came to be exercised in this field also and is now practically complete.

With the domestic market well under control, beer industry began to expand both abroad and in colonies. The Dai Nippon Beer Co., Ltd. established the Keijo Beer Co., Ltd. at Keijo with a capital of ¥6,000,000, one-fourth of which was paid up, and began brewing on January 6, its capacity being 100,000 cases a year. The Kirin Beer Co., Ltd., too, established the Showa Kirin Beer Co., Ltd. in the same city with a capital of ¥3,000,000, ¥1,200,000 of which was paid up. This mill has also a capacity of 100,000 cases a year. In this manner beer will be supplied in Korea by these companies, the sales of which will be controlled by the Keijo Branch of the Joint Sales Company of Beer in Japan proper. In Manchoukuo, the Manchurian Beer Co., Ltd. was established on a joint account of the Dai Nippon and the Kirin Beer Companies, with a capital of ¥2,000,000

Digitized by Google

fully paid up, which will supply from 100,000 to 150,000 cases a year, beginning with 1935. Aside from this the Great Manchurian Hops Beer Co., Ltd. with a capital of ¥10,000,000 was also established in Mukden. This company intends to raise hops in Manchuria in addition to brewing beer. Five brewery companies which were around Harbin with two others in Mukden, the total capacity of which was 400,000 cases a year, were absorbed by this new company.

Beer Brewery Companies Capitalization, number of breweries, and capacity, etc. of principal brewing companies at the end of the second term of 1934 follow:

CONDITIONS OF PRINCIPAL BREWING COMPANIES

(in ¥1,000)

Companies	Authorized Capital	Paid-up capital	Profit	Breweries	Capacity (in koku)

Tokyo					
Cascade group	1,500	—	—	1	30,000
Sakura	4,000	—	—	1	120,000

Japanese Saké

History Japanese saké, brewed from rice, has been the principal alcoholic liquor of the Japanese from olden times. It is brewed everywhere in the country, but the most famous places are the "Nada Gogo," five villages in Hyogo prefecture, the climatic conditions of which are peculiarly suited for its production. In recent years, Hiroshima and Fukuoka prefectures have also begun to brew saké of superior grade. The best rice for saké brewing is raised in Kumamoto, Hyogo and Okayama prefectures.

As saké has been the chief drink of the people for many centuries it has been heavily taxed all along. In 1879, a tax of ¥2 per koku was levied and since then the rate has been gradually increased until it now amounts to ¥40 per koku and brings in an annual revenue to the Government of ¥200,000,000.

No study of brewing saké on a scientific basis was started until as late as 1895. In 1904, a Brewery Experimental Station was established by the Government, at Oji, a suburb of Tokyo, various experiments were made, and many good experts trained. The art of brewing has now advanced a great deal and the quality of saké brewed has become practically uniform. The quantity now brewed annually is about 5,000,000 koku, nearly all of which is consumed at home, only a negligibly small quantity being exported to China and several other countries.

Present Condition Production of saké in recent years is as follows:

Year	Production (hectolitres)	Value in yen
1922	6,151,385	272,453,996
1923	11,175,024	405,712,482
1924	10,942,672	339,269,684
1925	10,454,276	322,481,958
1926	10,460,587	313,419,561
1927	9,812,516	298,738,816
1928	9,305,899	293,386,838
1929	9,608,146	301,716,100
1930	8,676,989	275,599,803
1931	7,435,560	233,122,205
1932	6,908,842	269,215,545
1933	7,989,788	307,177,000

Digitized by Google

The peculiarity of brewing saké is that large quantities of raw materials cannot be fermented at once. According to the growth of saccharomyces saké, steamed rice, yeast, and water are gradually added and fermentation is brought about slowly. If this method is adopted, with only a very small quantity of saccharomyces saké a large amount of raw materials may be fermented and saké of good flavour may be brewed. If, on the other hand, a large quantity of raw materials is fermented at one time by using a great deal of saccharomyces saké, the resultant saké will not taste good.

Consumption of Saké Nothing is more directly affected by prosperity or depression than the consumption of saké, and it can be quite well understood that consumption, owing to the economic depression, has considerably decreased during the last few years. The farming districts are now feeling the depression very severely, and as saké is consumed more in rural than in urban districts, the saké brewers have suffered in proportion.

The Saké Business in 1934 In anticipation of heavy industries and export boom, amount of saké brewed in 1933 exceeded that of 1932 by about 108,000 hl. But in 1934, depression in rural districts was so severe that the consumption of saké did not increase, and only toward the close of the year there was activity in sales.

Owing to higher price of 1933 rice crop it was anticipated that the price would be higher in 1934, which was impossible, however, due to dull demand. But, toward the close of the year, with the approach of demand season, market suddenly became very active, and sales increased. It is considered that saké brewed in 1934 was about 360,000 hl. less than 1933.

Saké Brewery in Manchoukuo Plans were under consideration to establish saké brewery in Manchoukuo, which materialized in 1934. The brewers of "Kiku-Masamuné" of Nada, near Kobé, established a company there, which has a capacity of 1,500 koku a year of saké newly branded "Manshu-Kiku-Masamuné", while the brewers of "Hakkaku" also established one with the same capacity, the saké newly brewed by this company being branded "Kinkaku". Both began brewing on November 15.

Soft Drinks

As Japan is geologically blessed with mineral springs, the people were not slow to study their medicinal effects, and hot springs were used as baths from olden times. As to the utilization of mineral spring water for drinking purposes, mineral water from Rokko Mountain in Hyogo prefecture was the first of its kind that was put on the market. This was as late as 1883, and the drink was named "Mitsuya Hiranosui". Three years later, some Englishmen taught the making of artificially aerated water and with the importation of Codd's bottles and syphon-bottles the manufacture of sweetened aerated water originated. These drinks soon became very popular and the industry made rapid development. After the Russo-Japanese War, "Champion" cider was put on the market to be soon followed by lemonade, citron, and different kinds of syrup, etc.

At present the total production of soft drinks amounts to 710,000 koku a year, of which sweetened drinks accounts for 93%, the rest being ordinary unflavoured aerated water or soda-water. Producers of soft drinks may be roughly divided into two classes. The first of these is composed of those who manufacture

Digitized by Google

the drinks along with beer. These have good equipment and produce on a large scale. The second class is made up of those many who produce on a small scale and sell their products locally.

PRODUCTION OF SOFT DRINKS

Year	Lemonade	Cider	Soda water	Total
	koku	koku	koku	koku
1925	281,219	252,495	17,613	551,327
1926	384,741	238,940	23,195	646,876
1927	265,280	230,228	18,685	514,143

1931[1]	136,826	212,436	15,460	364,722

	Lemonade, etc.		Soda water, etc.	Others and Total
1932 (in litre)[2]	22,954,172	73,047,750	7,119,783	161,218,950
1933	24,152,273	53,684,554	7,384,382	129,667,486

[1] Figures are for production between March 1,1931 and February 28, 1932.
[2] (See Chapter XXXII.)

Soft drinks which are now selling in Japan can be classified from the standpoint of water and gas used into the following:

(1) Those manufactured of natural spring water and natural carbonic acid.

(2) Those manufactured of natural spring water and artificial carbonic acid.

(3) Those manufactured of filtered or well-water and artificial carbonic acid gas.

Canning

Introduction

The canning industry in Japan was started as early as 1870, but the real impetus to its development was given by the Sino-Japanese and the Russo-Japanese Wars as they created a great demand for canned provisions for the Army and Navy. The Treaty of Portsmouth also served to further encourage this industry by giving Japan fishing rights in Kamchatka and the Maritime Province of Siberia, and together with the development of can manufacturing and floating canneries, the above have been the cause of the great progress in the canning industry as a whole.

Present Conditions of the Industry

At present, the packing industry in Japan is in a fairly developed state in all of its branches. Canned meats have reached a stage where the quantity of production cannot be increased. The demand for meat in Japan has expanded so far that supply cannot keep pace with demand, a shortage of cattle is being felt and a plentiful supply for canning is not forthcoming. On the other hand, canned vegetables, such as canned bamboo shoots, are finding good markets in the U. S. A. and China. Of all the fruits procurable in cans pineapples are the most popular with the Japanese. They are produced in Formosa, and of the 450,000 cases or more that are pack-

Digitized by Google

ed in that island about 400,000 cases are consumed in Japan proper while a greater part of the balance is sold in Formosa, and only a few thousand cases are exported to foreign countries. As to canned fish and shellfish, the production of canned crab and salmon dominates all others. In no other places are canned crabs produced in such large quantities as in Japan, and most of this production is exported to the U. S. A., annual exports being valued at about ¥10,000,000. Red and silver salmon are finding a good market in Great Britain. In view of the fact that catches of salmon on the coast of the U. S. A. and Canada are decreasing the exportation of canned salmon is expected to increase, as also is the exportation of crab-meat, for the demand for it in the U. S. A. is increasing steadily.

PRODUCTION OF CANNED PROVISIONS
IN 1933
(Quantity in 1,000 kg. value in ¥1,000)

Kinds	Quantity	Value
Canned meats	3,237	2,759
Canned fishes	57,219	42,358
,, fruit	3,576	2,103
,, vegetable	7,496	2,809
Other canned food	33,517	14,028
Total	105,045	64,057

The export of canned provisions from Japan for 1934 amounted to 110,417,000 kin in gross, worth ¥50,304,000, showing an increase of ¥3,320,000 over 1933. The low exchange rate was a potent factor to have caused the heavy gain in exports. Of the exports, 16,099,000 kin worth ¥11,170,000 was for the United States ; 43,526,000 kin, worth ¥24,711,000 for the United Kingdom; 4,566,000 kin worth ¥1,197,000 for the Kwantung Leased Territory ; 1,690,365 kin worth ¥828,000 for Hawaii ; 1,342,000 kin worth ¥797,000 for Australia ; and 43,194,000 kin worth ¥11,601,000 for others. Catches in Northern Waters in 1934 were almost unprecedentedly large, exceeding even those of 1929. The principal product, i. e., the canned red salmon totalled more than 1,000,000 cases, if products in the Northern Curile Islands were included, while product of canned crab totalled 417,000 cases. Export of canned salmon also proved good, as shown in the table attached at the end of this chapter. However, 1934 good catches in Northern Waters seem partly due to fishing ruthlessly carried out. In order to terminate ruthless way of fishing and to cultivate propagation of fishes, the Department of Agriculture and Forestry took steps to restrict, after 1935, the number of vessels engaged in fishing in Northern Waters to 30 per cent. less than the number engaged in 1934.

Export of Tunny Favoured by low exchange, export of tunny, especially to the United States, made a rapid development in recent years. It occupies the third position among fish products as export articles, the first and second being salmon and crab in the order named. Its amount exported in 1933 totalled ¥10,000,000, greater portion of which was sold in the U. S. A., where oiled canned tunny is highly valued as sea-chicken, which is produced almost exclusively in Shizuoka prefecture. The U. S. A.

Digitized by Google

now began to bar import of tunny and in January, 1934, raised duty from 30 to 45 per cent. This led to a conference held at Los Angeles between exporters and importers.

A part of tunny is exported refrigerated and the balance as canned food. American importers proposed to restrict import of the two together to 10,000 tons a year which was one half of the quantity taken in 1933. This, however, Japanese exporters could not accept. The conference did not result in anything after all, it having finally failed in June. However, 1934 fishing of tunny was a poor haul, which naturally restricted the export of its product in that year.

Manufacturers

Of all the packing companies, the Nichiro-Gyogyo Kaisha, Ltd. (Japan-Russian Fishing Co., Ltd.) is the largest, in fact it is regarded as the largest of its kind in the world. The company is engaged in the manufacture of canned crab and salmon on the east and west coasts of Kamchatka and along the coast of the Sea of Okhotsk and the Maritime Province. The number of fishing districts of the company differs each year, but in 1931, the company had 135 fishing districts and 22 canneries. Besides these the company owns 9 cold storage vessels, the capacities of which are in total 13,156 tons, and several refrigerators in Aomori and Shibaura. The space in these refrigerators is 342,000 cu. ft., with a capacity to hold about 140,000 salmon.

CHAPTER XXII

MISCELLANEOUS INDUSTRIES

Paper, Cement, Ceramics, etc.

Paper

Historical and General

Paper-making in Japan remained a handicraft for over twelve centuries after a Korean priest, Doncho, introduced the technique in 610 A. D. (Some writers maintain that paper existed in this country prior to that date.) During this long period of time, various grades of paper were produced from fibres of certain shrubs such as "kozo[1]," "mitsumata[2]," "gampi[3]," etc.

Foreign-style paper was made for the first time in the 7th year of Meiji, 1874, in a small mill in Yukosha, Tokyo, through the assistance of an English engineer. Several more mills were established the following year, but the development of the industry was naturally slow on account of the small demand. In the beginning, the raw materials used for foreign-style paper were chiefly rags, but in 1889, wood pulp was used for the first time in a mill which belonged to the Oji Paper Mills, Ltd. At first, the smallness of quantity required and competition from abroad made it that the industry had a very severe struggle, but as with all other industries, the wars with China in 1894-95 and with Russia in 1904-5 gave it a great chance of development. In 1910, the Tomakomai Mill of the Oji Paper Mills, Ltd., which had been under construction since 1906 began operation. This was the turning point in the history of our paper-making industry, as Japan began to operate a mill in a place where she could get ample supplies of wood for pulp. With the establishment of the Tomakomai Mill Japan became self-supplying with respect to newsprint. Again, the Oji Paper Mills, Ltd., took the initiative in establishing a pulp mill, in 1912, in Otomari, Saghalien Island, but was quickly followed by the Fuji Paper Mills, Ltd., and the Karafuto Industrial Co., Ltd. The industry was just getting well settled when the Great War broke out and prosperity was forced upon it. Importations of foreign-style paper was practically stopped. Demand at home advanced, exports increased and the industry expanded at a great speed. The production of foreign-style paper in 1881 was only 3,968,000 lbs., it increased to 327,614,000 lbs. in 1914, 519,141,000 lbs. in 1919, 817,383,000 lbs. in 1924, and 1,418,187,000 lbs. in 1929.

In 1932 the Oji Paper Mills, Fuji Paper Mills and Karafuto Industrial Company were merged into one firm under the name of the Oji Seishi Kabushiki Kaisha (Oji Paper Manufacturing Company, Ltd.). It has a subscribed capital of ¥149,988,000, of which ¥112,661,475 is paid up, and is virtually monopolistic having control over 80% of the total paper production in the country and pro-

1 Paper mulberry. 2 Golden flowered Edgeworthia (Edgeworthia chrysantha). 3 An indigenous plant (Wikstroemia sikokiana).

Digitized by Google

ducing about 85% of the total foreign-style paper. The real strength of the Oji Paper Manufacturing Co., Ltd. lies in its almost complete monopoly of pulp production. In 1933 it turned out 590,000 tons, which was equivalent to 95.2 per cent. of domestic production.

Production

The paper-making business in Japan was carried on for a long time as a side-line or cottage industry, and even to-day there are numerous families in local districts which are engaged in Japanese paper making. Foreign-style papers are produced on a modern industrial basis. Nine large companies form the Nihon Seishi Rengokai (The Paper-Makers' Association of Japan). They are the Oji Paper Manufacturing Company, Ltd., Mitsubishi Paper Mills, Ltd., Hokuetsu Paper Mills, Ltd., Nihon Paper Industry Co., Ltd., Inui Paper Mills, Ltd., Nihon Paper Mills, Ltd., Nishino Paper Manufacturing Plant, Showa Co., and Asahi Co. These companies together produce 98% of the foreign-style paper in Japan. The chief functions of this organization at present are to make agreements for the limitation of production, for the joint control of stocked paper and for the maintenance of selling prices. Four of the member companies produce pulp in addition to paper, and the largest company, Oji, produces newsprint, the production of which is so large that they practically supply all domestic requirements, only a very small quantity being imported.

Production as well as sales broke previous records of 1,418,187,000 pounds and 1,379,231,000 pounds respectively in 1929. The chief cause for rise in volume of output and sales was a lifting of pressure from import paper because of a decline in the yen's exchange rate.

In 1930, the consumption of paper was reduced to an alarming degree and as a measure to dispose of surplus products, the Nihon Seishi Rengokai agreed to reduce production. During 1931, the curtailment was 35% from January to August, 45% from September to November, and 55% in December. The production of cardboard was also curtailed by 45%. In this manner, production in 1931 was reduced by 37,000,000 lbs. or 2.7% as compared with the previous year. The figures in the following tables show production since 1924.

PRODUCTION OF PAPER SINCE 1924

(Quantity in 1,000 kg. and value in ¥ 1,000)

Year	Printing paper		Copying paper		Drawing paper		Wrapping paper	
	Quantity	Value	Quantity	Value	Quantity	Value	Quantity	Value
1924	285,926	72,084	536		240		17,848	3,601

Cellophane

The monthly output of the Japanese cellophane industry, which has grown considerably within recent years, is approximately 6,000 reams produced by 11 manufacturing concerns, such as Nippon Cellophane, Tokyo Cellophane, Takasaki Cellophane, Fuji Glyphane and others. Ever since 1932 importing of the French product into Japan has been checked. Thus, the country's cellophane industry, having become self-sufficient, is today exporting this domestic product and the line is one of the most promising in the land. Cellophane exportation has been conducted since January, 1934. Orders keep coming from British India, the Straits Settlements, Hongkong and other points abroad. India is considered as an exceptionally worthwhile market for the product. Having become encouraged, many cellophane producers are expanding their products. The 1933 production reached 574,029 kg. valued at ¥2,000,000. This industry in Japan may outdistance the corresponding French industry, and places its products on the markets of various European countries. Cellophane was first imported into about 1923, but in the following year Japanese found how to manufacture it. The Tokyo Cellophane Company started the operation and then several other companies followed suit. Both imports and exports are hardly worth mentioning in quantity and value. Its production since 1929 rapidly expanded as the following table shows :

PRODUCTION OF CELLOPHANE

Year	Production	
	Qty in kg	Value in yen
1929	16,875	86,400
1930	—	85,400
1931	64,575	176,170
1932	147,000	473,634
1933	574,029	2,008,057

Consumption of Paper

Foreign-Style Paper Looking at the figures of paper consumption, we find that until 1929 it kept increasing, but in the following year it decreased somewhat owing to the world-wide economic depression. It increased again in 1931, but we can safely presume that the stock was considerable, because imports increased considerably while exports decreased to an alarming degree. The following table indicates the trend of paper consumption during the past twelve years.

CONSUMPTION OF FOREIGN-STYLE PAPER

(Quantity in 1,000 lbs.)

Year	Production	Imports	Exports	Consumption	Consumption per capita
1923	794,005	113,556	68,455	839,106	13.9
1924	893,249	175,384	77,164	991,469	16.2
1925	986,752	96,919	96,300	987,371	15.9
1926	1,106,788	137,622	86,462	1,157,947	18.4
1927	1,191,074	112,555	92,484	1,211,245	18.9
1928	1,343,479	102,863	134,035	1,312,307	20.2
1929	1,451,526	81,084	140,289	1,392,321	21.1
1930	1,401,711	100,160	168,808	1,333,063	19.9
1931	1,374,899	147,549	141,821	1,380,627	20.4
1932	1,311,315	99,453	87,356	1,323,412	19.0
1933	1,444,104	104,330	105,200	1,480,930	21.2
1934	1,591,474	138,556	139,715	1,605,350	22.6

Japanese Paper Accurate records of production of pure Japanese papers are not obtainable due to the extensiveness of production and the widespread and different classes of producers. Much "washi", or home-style paper is now made by machines and aside from this group we are at a loss to determine the exact amount produced. The Nihon Seishi Rengokai estimated the production of Japanese papers during 1932 to be about 150,000,000 lbs., and with an average price of 40 sen per lb., the total value was ¥60,000,000 for the year. Exports of these Japanese papers in the same year were 5.5% of the total weight. Subtracting exports from total production, about 140,000,000 lbs. remain as the amount consumed in 1932.

Pulp Industry

Since Japan started to manufacture wood pulp in 1889, its development has kept pace with the development in the paper industry, and expansion during the time of the World War was prodigious. The industry has been in a state of depression since 1921, but in spite of that capacity of production has expanded. In the years 1930, 1931 and the early part of 1932, it was further depressed on account of the shrinkage in demand, lower prices, and competition from Canada and Scandinavia.

Production and Imports The peculiarity of paper pulp production in Japan is that there is no independent mill which produce pulp of this description, that which is produced being turned out by paper-makers, who not only produce for their own consumption, but also for the purpose of selling to other paper-makers. Most of Japanese paper-makers who do not own pulp mills, therefore, must either rely on the Japanese pulp

Digitized by Google

producers for supplies of pulp, or must buy imported pulp. Tables given below show the amount of production and import of pulp, as well as the amount of lumber used for pulp production. There is hardly any export of pulp from Japan.

PRODUCTION OF PULP

(in tons)

Year	Sulphite Pulp	Ground Pulp	Kraft Pulp	Others	Total
1928	310,020	237,203	20,306	—	567,529
1929	335,436	257,043	26,123	—	618,602
1930	337,151	259,984	28,402	—	625,537
1931	290,171	246,489	30,049	—	566,709
1932	277,588	241,746	31,786	—	551,120
1933	310,621	267,993	40,144	1,281	620,039

QUANTITY OF LUMBER CONSUMED FOR PULP MAKING

(unit in koku)

Year	Lumber Grown in Japan Proper	Lumber Grown in Hokkaido	Lumber Grown in Saghalien Isd	Lumber Grown in Korea	Total
1928	369	2,411,572	5,268,041	224,796	7,905,884
1929	616	2,399,972	5,881,730	295,751	8,578,069
1930	870	1,991,764	6,234,974	199,280	8,426,888
1931	280	1,391,188	5,823,950	201,548	7,416,011
1932	970	1,292,612	5,224,265	276,302	6,794,149
1933	2,917	1,367,684	5,594,475	313,807	7,278,883

IMPORT OF PULP

(Qty in 100 kin and value in ¥1,000)

Country of origin	1931		1932		1933		1934	
	Qty	Value	Qty	Value	Qty	Value	Qty	Value
Sweden	272,530	1,792	230,132	1,220	439,657	3,571	800,652	7,488
Norway	365,536	4,115	174,087	2,013	527,249	7,577	669,256	10,464
U.S.A.	374,371	3,951	339,845	2,418	755,276	7,801	1,415,096	16,464
Canada	455,567	3,144	829,218	5,200	788,420	6,043	679,951	7,245
Others and total	1,712,784	15,328	1,703,762	11,840	2,708,373	27,066	3,814,656	44,265

Demand and Supply There is scarcely any export of pulp from Japan, and domestic production plus the quantity imported can be taken as quantity required. The following table shows the relation between demand and supply.

DEMAND AND SUPPLY OF PULPS DURING THE LAST 5 YEARS

(Unit in ton)

Year	Quantity produced	Quantity imported	Quantity required
1928	567,529	73,144	640,673
1929	618,602	80,410	699,012
1930	625,537	79,107	704,644
1931	566,709	100,636	667,221
1932	551,120	101,168	652,288
1933	620,039	159,880	779,919

Digitized by Google

From 90 to 93% of the quantity consumed is taken by the member companies of the Rengokai.

Rayon Pulp Rayon pulp really holds no claim for inclusion here except that it is produced by the paper pulp manufacturing companies, who in turn are the paper manufacturers. A very brief survey only will be given. The rapid progress of rayon industry (see Chapter XVIII) is nothing but marvellous. Along this the consumption of rayon pulp increased rapidly. The total demand on rayon pulp in 1934 reached more than 70,000 tons, showing an increase of 70 per cent. over that of 1933. But the domestic production of rayon pulp amounted only to about 10 per cent. of the total requirement in 1933, and even in 1934 the quantity produced was barely 10,000 tons, which made it necessary to import more than 60,000 tons. Rayon pulp produced by the Oji Paper has now passed its experimental stage, and the company has extended mills so that it expects to produce about 24,000 tons a year starting from February, 1935. The company also established an independent company called Japan Rayon Pulp Co., Ltd., in Karafuto, with the capacity of 30,000 tons a year, which will be solely engaged in production of rayon pulp, and begins operation in April, 1935. The Oji Paper, therefore, is prepared to produce 54,000 tons of rayon pulp from the latter part of 1935,

1934 Paper Industry

Trend in General For the past two years paper industry was freed from the pressure of foreign competition through lower exchange and higher tariff. The increased demand made it possible to reduce the curtailment of production which was fixed at 55 per cent. since December, 1931 to 46 per cent. Furthermore, the sealed stock of paper has been reduced to a quantity smaller than regularly stocked quantity, which contributed in making the price strong.

The increase in volume of consumption made the demand and supply relation very sound. However, the nominal price of paper did not rise, while the price of pulp rose. Most of members of the Nihon Seishi Rengokai buy pulp so that their interest is directly opposite to that of the Oji Paper Co., Ltd. which produce 95 per cent. of the total domestic production of pulp. These companies, therefore, lodged claim with the Oji Paper Co., Ltd. and succeeded in reducing the price of pulp by 5 rin lb. in the latter part of the year.

Demand and Supply Production of foreign-style papers by member companies of the Nihon Seishi Rengokai in 1934 was 1,591,474,000 lbs. which, as compared with 1,444,104,000 lbs. of 1933, showed an increase of 147,370,000 lbs. or 10.2 per cent. Export amounted to 172,306,000 lbs. valued at ¥20,650,000 and showed gains of 18,282,000 lbs. and ¥2,963,000 or 11.8 and 16.7 per cent. respectively over the year before.

Import of paper amounted to 138,556,000 lbs. valued at ¥11,925,000 which showed an increase of 32.8 and 15.6 per cent. respectively over the year before. As to pulp, about 508,620,000 lbs. valued at ¥44,250,000 were imported from the U.S.A., Sweden, Canada, Norway and Germany, etc. The domestic requirement of pulp was 1,605,350,000 lbs., showing an increase of 148,270,000 lbs. over 1933.

Pulp Consumption of pulp by member companies of the Nihon Seishi Rengokai in 1934 follows :

Digitized by Google

CONSUMPTION OF PULP FOR PAPER

(by member companies only)

Description	in tons 1933	1934	Increase in 1934
Chemical pulp	397,731	401,601	3,870
Ground pulp	255,396	296,344	40,948
Total	653,127	697,945	44,818

Both chemical and ground pulp increased in consumption, the rate of the total increase being 6.8 per cent. over 1933.

As regards production of pulp, the Forestry Bureau of the Department of Agriculture and Forestry estimated 696,560 tons as against 620,039 tons of 1933. However, the boom in the paper industry was such that the domestic production of pulp alone was not enough to meet the demand, this resulted in large import, figures of which follow :

IMPORT OF PULP

	In 1934	Increase over 1933
Quantity of pulp imported in tons	225,300	65,420
Value of pulp imported in ¥1,000	44,255	17,189

Figures show that the increase over 1933 was about 65,420 tons, which includes, however, a large quantity of rayon pulp.

Curtailment of Production The boom which has been kept up since the latter part of 1932 has enabled paper-makers to reduce the percentage of curtailment of production of foreign-style papers by successive steps. The curtailment which was kept at 55 per cent. throughout 1933 was reduced to 51 per cent. in May, 1934 and again to 46 per cent. after October of the same year. Curtailment of production of Japan-style paper is maintained at 30 per cent.

Pulp Industry in Manchoukuo Four companies have been established in Manchoukuo for production of rayon and paper pulp. They are Oji Paper Mills Pulp Co., Ltd. with a capital of ¥20,000,000, Eastern Manchurian Pulp Co., Ltd., with ¥15,000,000, Japan Manchurian Pulp Industry Co., Ltd., with ¥10,000,000 and Manchurian Pulp Co., Ltd. with ¥5,000,000.

Market in General Good sales of foreign-style paper kept its price firm. However, mindful of warning of the Department of Commerce and Industry, the Rengokai did not raise the nominal price. It is thought that a further raising of price by a large margin would be impossible at present, even though the market improves further. The following table shows firm tone of the paper market indicating that the control of the industry is well maintained :

MARKET PRICE OF B IMMITATION PAPER

(in sen per lb.)

Months	Highest	Lowest
Jan.-June	16.8	16.8
July	16.8	16.7
Aug.-Dec.	16.8	16.8

As regards pulp it was once very difficult to make import owing to low exchange, which raised the price of domestic pulp. Along with the great demand on rayon pulp, price of unbleached sulphite pulp rose as high as 8.3 sen per lb. in the earlier part of the year, which later declined to 7.7 sen, again picking up to 8.2 sen toward the close of the year. The fluctuation of price follows :

MARKET PRICE OF PULP

(in sen per lb.)

Months	Highest	Lowest
Jan.-June	8.3	8.3
July	8.3	7.7
Aug.-Oct.	7.7	7.7
Nov.-Dec	8.2	7.7

Fertilizers

In 1931 the association formed by manufacturers of chemical fertilizers, maintained a high rate of curtailment of production in order to minimize the loss resulted from the general alarming situation on industries, especially on agriculture, but the dumping of sulphate of ammonia by British and German manufacturers swept the fertilizer market and the prices of bean cake, fish guano, sulphate of ammonia, superphosphate of lime, mixed fertilizers, cyanamide, etc., slumped to destructive levels. The domestic manufacturers did everything possible in their powers to stop importations. They proposed the raising of the rate of import duty, the passing law, the establishment of a system of special permits for import and export, and so on, but practically in vain. The price of sulphate of ammonia declined to as low as ¥60 per ton. The situation was very serious, and at last, in November, a special permit system was put into effect through a Departmental ordinance. A ministerial change took place during December and the Seiyukai Party came into power. The Government at once re-imposed the embargo on gold, exports and the stock market immediately became active, and industries, including the fertilizer industry, followed suit.

The problem of food in Japan is a serious one. The Japanese population is increasing yearly by about a million, but the amount of food produced in the country is not enough to feed them. Besides, the arable land in the country is so small and limited that hardly any space is left to effect any further increase, and the only method left, beyond extending abroad, is to increase the yield of crops through intensive farming. For this fertilizers are necessary and the demand has steadily been increasing. The consumption of fertilizers during 1930 was valued at ¥526,685,000, of which ¥282,470,000 were self-supplied fertilizers, while ¥244,215,000's worth were bought in the market.

General Condition of the Industry

Of all the chemical fertilizers, superphosphate of lime and sulphate of ammonia are the two representative ones, and because of the largeness of their demand and supply the market trend of these two is practically the market trend of the rest.

Superphosphate of Lime The principal raw material for the manufacture of superphosphate of lime is phosphate rock. During 1930 some 570,000 tons were imported, while some 63,385 tons were produced at home, and during 1933 and 1934 imports were 698,234 and 671,533 tons respectively. This rock is imported from U. S. A., Egypt, and the South Sea Islands.

Superphosphate production has been gaining steadily and last year its production is estimated at 1,125,000 tons. Production during the past few years is reported by the Ministry of Commerce and Industry as follows:

PRODUCTION OF SUPERPHOSPHATES
(In metric tons)

1929	408,971
1930	424,484
1931	888,887
1932	1,037,730
1933	1,127,977
1934 (estimate)	1,125,000

The superphosphate market was depressed throughout the year due to rural depression, higher prices of raw materials, and constant disputes between the Union of Superphosphate Distributors and its outsiders.

Digitized by Google

Low exchange and conclusion of the International Phosphate Agreement last year together acted to pull up prices of phosphate rocks and finished products. Domestic production capacity is rated at about 1,955,000 tons a year about 45 per cent. of which is, however, curtailed. Production in recent years runs between 1,120,000 and 1,230,000 tons.

Fluctuations in the market price of superphosphate during 1933 and 1934 were as follows:

PRICE OF SUPERPHOSPHATE, 1933, 1934

(The price is per bag of 7.5 kan.)

	1933		1934

Sulphate of Ammonia The demand for sulphate of ammonia has steadily increased for years. Consumption in 1930 was 488,000 tons, in 1931 it showed a remarkable increase to 618,000 tons. Imports in 1930 were 302,905 tons (value ¥29,612,000), in 1931 they decreased to 224,148 tons and in 1932 a decrease to 119,000 tons was witnessed, value being ¥15,861,000 and ¥7,035,000 respectively. The decrease in imports was made good by the increase in domestic production, which in 1931 was 393,237 tons, while in 1932 it increased to 604,235 tons, to 719,000 tons in 1933 and to 735,000 tons in 1934. Japan, in this manner, has become self-supporting in sulphate of ammonia, and has become very uneasy regarding overproduction in the future.

In Europe and America, the International Nitrogen Conference failed to relieve various countries from the pressure of overproduction, and these countries, in 1931, tried to dump their stocks in the Orient, especially in Japan, thereby causing the price of sulphate to sharply decline.

Ammonium sulphate production has been rising remarkably in the past several years, especially since the fall of the yen made competition by foreign fertilizers more difficult. Last year output rose to 735,000 tons. In 1932 it had registered the biggest advance in its history, jumping from the 393,237 tons of 1931 to 604,235. Last year showed a total more than nine times as great as that of 1920. Figures follow:

AMMONIUM SULPHATE PRODUCTION

(In tons)

1920	80,100
1925	181,138
1926	147,000
1927	176,475
1928	232,425
1929	234,609
1930	265,826
1931	393,237
1932	604,235
1933	713,550
1934	735,000

The following table shows producers of sulphate of ammonia with their capacities of production:

PRODUCTION CAPACITY OF AMMONIUM SULPHATE IN 1935

(in tons)

Companies	Present capacity	Capacity to be increased in 1935	Total production capacity

Grand total	1,168,400	457,500	1,625,800

The gains made by ammonium sulphate are due to the fact that it has gained the reputation as the fastest working fertilizer sold here, since it is quickly absorbed into the soil of both paddy and upland fields and is effective for all kinds of cereals and vegetables except legumes. Since the World War it has been encroaching upon the field of bean cake, also a nitrate fertilizer. Foreign ammonium sulphate dominated the market until a few years ago and the domestic industry hardly got going. The lower yen aided it and this year's output is expected to be well above 1,100,000 tons. In spite of the fact that all domestic fertilizer companies have been operating at capacity in ammonium sulphate, Japan expects to have a deficit of 120,000 to 130,000 tons for the 1934 fertilizing year (August, 1934, to July, 1935), according to the Ministry of Commerce and Industry. Supply and demand figures follow :

AMMONIUM SULPHATE DEMAND AND SUPPLY

(In 1,000 tons)

* 27 bags of the domestic product constitute a ton.

Cyanamide While cyanamide was a fertilizer difficult to make farmers use it, they now recognize the merit of this nitrogenous fertilizer, and owing perhaps to its reasonableness in price, its consumption increased with a great stride. In 1931 its consumption was 168,448 tons, in 1932 180,583 tons, and in 1933 223,409 tons. Production increased rapidly too. While, in 1924, it barely amounted to about 30,000 tons, it increased up to 278,825 tons in 1933, almost ten times as large. The following table shows this :

PRODUCTION OF CYANAMIDE

(Unit in metric ton and in yen)

Year	Quantity	Value
1924	29,981	4,510,707
1925	49,662	8,133,625
1926	97,107	8,353,940
1927	64,981	6,146,775
1928	65,190	6,311,975
1929	211,593	17,355,508
1930	205,572	16,649,704
1931	195,018	9,747,662
1932	283,386	16,700,175
1933	278,825	19,934,167

Digitized by Google

Sales are made through the joint sales association. Through the control of this association, and also with the increased demand, the cyanamide market in 1934 was kept firm. From August the article was sold out at a reduced price, since with that month the new fertilizer season of 1934-1935 began. The average monthly price of cyanamide in 1934 follows :

PRICE OF CYANAMIDE, 1934

(20% ingredient 6 kwan net per bag)

Jan.	¥1.75	May	¥1.83	Sept.	¥1.65
Feb.	1.80	June	1.80	Oct.	1.67
Mar.	1.80	July	1.80	Nov.	1.65
Apr.	1.82	Aug.	1.65	Dec.	1.67

Vegetable Fertilizers Vegetable fertilizers are many in kind. Bean cake, rape-seed cake, cotton-seed cake, rice bran, etc., come into this class of fertilizers, bean cake being the most important. Supplies and consumption for 1933 were :

SUPPLY AND DEMAND OF VEGETABLE FERTILIZERS, 1933

(in ton)

	Production at home	Imports	Exports	Consumption
Bean cake	244,768	530,953	2,319	770,029
Rape-seed cake	74,100	43,394	—	73,800
Cotton-seed cake	28,500	64,649	—	67,900

The domestic production of bean cake is very small when compared with the quantity imported, the greater part of which comes from Manchoukuo. In 1912 the consumption of bean cake, rape-seed cake, and cotton-seed cake was 34,640 tons, which, by 1921, increased to over a million tons, but since then no increase can be noted as the development of the synthetic nitrogen industry has cut deeply into the development of vegetable fertilizer industry.

A piece of a bean cake weighs 46 kin, or 7.4 kan. The average price of one piece was as high as ¥2.29 in 1926, whereas in 1933, the highest price was ¥1.18 and the lowest ¥0.95, a demonstration of the depressed state of the fertilizer market.

Owing to great bumper crops of soy beans in Manchoukuo in 1933, their production being estimated at 4,600,000 tons, an increase of 900,000 tons over 1932, sales of soy bean cakes revived to a great extent in 1934, and the market was firm, though in the latter part of the year demand contracted owing to crop failures in Japan. In spite of that import amounted to 6,795,000 pieces, a gain of 1,324,000 pieces over 1933. Market prices for 1934 follow :

MARKET PRICES OF BEAN CAKES IN 1934

(in yen)

December	3.58	3.70	3.62

Fish and Animal Fertilizers In Japan fish is indispensable as food, but at the same time they are caught for oil extraction and the refuse is converted into manure. The consumption of fish and animal fertilizers is as shown in the tables attached at the end of this article.

Digitized by Google

In addition to chemical vegetable and animal fertilizers, a great quantity of well-known fertilizers are also set and imported, the figures for which are given also in statistics annexed at the end of this subject.

1934 Fertilizer Industry

Trend in General 1933 rice bumper crop increased purchasing power of farmers in general, which was reflected in good sales of fertilizers in the earlier part of the year, and the industry was active. However, the yield of agricultural crops in 1934 proved to be extremely poor, and the sales of fertilizers in the latter part of the year was not as good as expected.

According to statistics of Finance Ministry, imports of principal fertilizers in 1934 are as given below, showing an increase both in quantity and value. Organic fertilizers, consumption of which once showed a decreasing tendency, indicated a gain, this being especially the case with bean cakes, which attracted attention. This was due, however, to a great yield of soy beans in Manchoukuo in 1933.

IMPORT OF PRINCIPAL FERTILIZERS
(in kin)

	1933	1934	Increase in 1934
Sulphate of potash	290,000	815,000	525,000
Nitrate of soda	582,000	663,000	81,000
Bone meal	402,000	476,000	74,000
Bean cakes	8,993,000	10,767,000	1,774,000

As to the amount of production in 1934 it is not available yet, but the Ministry of Commerce and Industry gives a tentative report on the production of the three principal chemical fertilizers as follows:

Superphosphate of lime	1,073,619 tons
Sulphate of ammonium	802,205 „
Cyanamide	139,662 „

Statistics

Production, imports, exports, and consumption of various kinds of fertilizers are to be found in the following tables:

THE VALUE OF FERTILIZERS PRODUCED IN JAPAN PROPER 1923-1933
(Unit ¥1,000)

Year	Fertilizers which requires a licence for production					Fertilizer not requiring any licence for production	Total

ed in that island about 400,000 cases are consumed in Japan proper while a greater part of the balance is sold in Formosa, and only a few thousand cases are exported to foreign countries. As to canned fish and shellfish, the production of canned crab and salmon dominates all others. In no other places are canned crabs produced in such large quantities as in Japan, and most of this production is exported to the U. S. A., annual exports being valued at about ¥10,000,000. Red and silver salmon are finding a good market in Great Britain. In view of the fact that catches of salmon on the coast of the U. S. A. and Canada are decreasing the exportation of canned salmon is expected to increase, as also is the exportation of crab-meat, for the demand for it in the U. S. A. is increasing steadily.

PRODUCTION OF CANNED PROVISIONS
IN 1933
(Quantity in 1,000 kg. value in ¥1,000)

Kinds	Quantity	Value
Canned meats	3,237	2,759
Canned fishes	57,219	42,358
,, fruit	3,576	2,103
,, vegetable	7,496	2,809
Other canned food	33,517	14,028
Total	105,045	64,057

The export of canned provisions from Japan for 1934 amounted to 110,417,000 kin in gross, worth ¥50,304,000, showing an increase of ¥3,320,000 over 1933. The low exchange rate was a potent factor to have caused the heavy gain in exports. Of the exports, 16,099,000 kin worth ¥11,170,000 was for the United States ; 43,526,000 kin, worth ¥24,711,000 for the United Kingdom; 4,566,000 kin worth ¥1,197,000 for the Kwantung Leased Territory ; 1,690,365 kin worth ¥828,000 for Hawaii ; 1,342,000 kin worth ¥797,000 for Australia ; and 43,194,000 kin worth ¥11,601,000 for others. Catches in Northern Waters in 1934 were almost unprecedentedly large, exceeding even those of 1929. The principal product, i. e., the canned red salmon totalled more than 1,000,000 cases, if products in the Northern Curile Islands were included, while product of canned crab totalled 417,000 cases. Export of canned salmon also proved good, as shown in the table attached at the end of this chapter. However, 1934 good catches in Northern Waters seem partly due to fishing ruthlessly carried out. In order to terminate ruthless way of fishing and to cultivate propagation of fishes, the Department of Agriculture and Forestry took steps to restrict, after 1935, the number of vessels engaged in fishing in Northern Waters to 30 per cent. less than the number engaged in 1934.

Export of Tunny Favoured by low exchange, export of tunny, especially to the United States, made a rapid development in recent years. It occupies the third position among fish products as export articles, the first and second being salmon and crab in the order named. Its amount exported in 1933 totalled ¥10,000,000, greater portion of which was sold in the U. S. A., where oiled canned tunny is highly valued as sea-chicken, which is produced almost exclusively in Shizuoka prefecture. The U. S. A.

Digitized by Google

now began to bar import of tunny and in January, 1934, raised duty from 30 to 45 per cent. This led to a conference held at Los Angeles between exporters and importers.

A part of tunny is exported refrigerated and the balance as canned food. American importers proposed to restrict import of the two together to 10,000 tons a year which was one half of the quantity taken in 1933. This, however, Japanese exporters could not accept. The conference did not result in anything after all, it having finally failed in June. However, 1934 fishing of tunny was a poor haul, which naturally restricted the export of its product in that year.

Manufacturers

Of all the packing companies, the Nichiro-Gyogyo Kaisha, Ltd. (Japan-Russian Fishing Co., Ltd.) is the largest, in fact it is regarded as the largest of its kind in the world. The company is engaged in the manufacture of canned crab and salmon on the east and west coasts of Kamchatka and along the coast of the Sea of Okhotsk and the Maritime Province. The number of fishing districts of the company differs each year, but in 1931, the company had 135 fishing districts and 22 canneries. Besides these the company owns 9 cold storage vessels, the capacities of which are in total 13,156 tons, and several refrigerators in Aomori and Shibaura. The space in these refrigerators is 342,000 cu. ft., with a capacity to hold about 140,000 salmon.

CHAPTER XXII

MISCELLANEOUS INDUSTRIES

Paper, Cement, Ceramics, etc.

Paper

Historical and General

Paper-making in Japan remained a handicraft for over twelve centuries after a Korean priest, Doncho, introduced the technique in 610 A. D. (Some writers maintain that paper existed in this country prior to that date.) During this long period of time, various grades of paper were produced from fibres of certain shrubs such as "kozo[1]," "mitsumata[2]," "gampi[3]," etc.

Foreign-style paper was made for the first time in the 7th year of Meiji, 1874, in a small mill in Yukosha, Tokyo, through the assistance of an English engineer. Several more mills were established the following year, but the development of the industry was naturally slow on account of the small demand. In the beginning, the raw materials used for foreign-style paper were chiefly rags, but in 1889, wood pulp was used for the first time in a mill which belonged to the Oji Paper Mills, Ltd. At first, the smallness of quantity required and competition from abroad made it that the industry had a very severe struggle, but as with all other industries, the wars with China in 1894-95 and with Russia in 1904-5 gave it a great chance of development. In 1910, the Tomakomai Mill of the Oji Paper Mills, Ltd., which had been under construction since 1906 began operation. This was the turning point in the history of our paper-making industry, as Japan began to operate a mill in a place where she could get ample supplies of wood for pulp. With the establishment of the Tomakomai Mill Japan became self-supplying with respect to newsprint. Again, the Oji Paper Mills, Ltd., took the initiative in establishing a pulp mill, in 1912, in Otomari, Saghalien Island, but was quickly followed by the Fuji Paper Mills, Ltd., and the Karafuto Industrial Co., Ltd. The industry was just getting well settled when the Great War broke out and prosperity was forced upon it. Importations of foreign-style paper was practically stopped. Demand at home advanced, exports increased and the industry expanded at a great speed. The production of foreign-style paper in 1881 was only 3,968,000 lbs., it increased to 327,614,000 lbs. in 1914, 519,141,000 lbs. in 1919, 817,383,000 lbs. in 1924, and 1,418,187,000 lbs. in 1929.

In 1932 the Oji Paper Mills, Fuji Paper Mills and Karafuto Industrial Company were merged into one firm under the name of the Oji Seishi Kabushiki Kaisha (Oji Paper Manufacturing Company, Ltd.). It has a subscribed capital of ¥149,988,000, of which ¥112,661,475 is paid up, and is virtually monopolistic having control over 80% of the total paper production in the country and pro-

1 Paper mulberry. 2 Golden flowered Edgeworthia (Edgeworthia chrysantha). 3 An indigenous plant (Wikstroemia sikokiana).

Digitized by Google

ducing about 85% of the total foreign-style paper. The real strength of the Oji Paper Manufacturing Co., Ltd. lies in its almost complete monopoly of pulp production. In 1933 it turned out 590,000 tons, which was equivalent to 95.2 per cent. of domestic production.

Production

The paper-making business in Japan was carried on for a long time as a side-line or cottage industry, and even to-day there are numerous families in local districts which are engaged in Japanese paper making. Foreign-style papers are produced on a modern industrial basis. Nine large companies form the Nihon Seishi Rengokai (The Paper-Makers' Association of Japan). They are the Oji Paper Manufacturing Company, Ltd., Mitsubishi Paper Mills, Ltd., Hokuetsu Paper Mills, Ltd., Nihon Paper Industry Co., Ltd., Inui Paper Mills, Ltd., Nihon Paper Mills, Ltd., Nishino Paper Manufacturing Plant, Showa Co., and Asahi Co. These companies together produce 98% of the foreign-style paper in Japan. The chief functions of this organization at present are to make agreements for the limitation of production, for the joint control of stocked paper and for the maintenance of selling prices. Four of the member companies produce pulp in addition to paper, and the largest company, Oji, produces newsprint, the production of which is so large that they practically supply all domestic requirements, only a very small quantity being imported.

Production as well as sales broke previous records of 1,418,187,000 pounds and 1,379,231,000 pounds respectively in 1929. The chief cause for rise in volume of output and sales was a lifting of pressure from import paper because of a decline in the yen's exchange rate.

In 1930, the consumption of paper was reduced to an alarming degree and as a measure to dispose of surplus products, the Nihon Seishi Rengokai agreed to reduce production. During 1931, the curtailment was 35% from January to August, 45% from September to November, and 55% in December. The production of cardboard was also curtailed by 45%. In this manner, production in 1931 was reduced by 37,000,000 lbs. or 2.7% as compared with the previous year. The figures in the following tables show production since 1924.

PRODUCTION OF PAPER SINCE 1924

Cellophane

The monthly output of the Japanese cellophane industry, which has grown considerably within recent years, is approximately 6,000 reams produced by 11 manufacturing concerns, such as Nippon Cellophane, Tokyo Cellophane, Takasaki Cellophane, Fuji Glyphane and others. Ever since 1932 importing of the French product into Japan has been checked. Thus, the country's cellophane industry, having become self-sufficient, is today exporting this domestic product and the line is one of the most promising in the land. Cellophane exportation has been conducted since January, 1934. Orders keep coming from British India, the Straits Settlements, Hongkong and other points abroad. India is considered as an exceptionally worthwhile market for the product. Having become encouraged, many cellophane producers are expanding their products. The 1933 production reached 574,029 kg. valued at ¥2,000,000. This industry in Japan may outdistance the corresponding French industry, and places its products on the markets of various European countries. Cellophane was first imported into about 1923, but in the following year Japanese found how to manufacture it. The Tokyo Cellophane Company started the operation and then several other companies followed suit. Both imports and exports are hardly worth mentioning in quantity and value. Its production since 1929 rapidly expanded as the following table shows:

PRODUCTION OF CELLOPHANE

Year	Production	
	Qty in kg	Value in yen
1929	16,875	86,400
1930	—	85,400
1931	64,575	176,170
1932	147,000	473,634
1933	574,029	2,008,057

Consumption of Paper

Foreign-Style Paper Looking at the figures of paper consumption, we find that until 1929 it kept increasing, but in the following year it decreased somewhat owing to the world-wide economic depression. It increased again in 1931, but we can safely presume that the stock was considerable, because imports increased considerably while exports decreased to an alarming degree. The following table indicates the trend of paper consumption during the past twelve years.

CONSUMPTION OF FOREIGN-STYLE PAPER

(Quantity in 1,000 lbs.)

Year	Production	Imports	Exports	Consumption	Consumption per capita
1923	794,005	113,556	68,455	839,106	13.9
1924	893,249	175,384	77,164	991,469	16.2
1925	986,752	96,919	96,300	987,371	15.9
1926	1,106,788	137,622	86,462	1,157,947	18.4
1927	1,191,074	112,555	92,484	1,211,245	18.9
1928	1,343,479	102,863	134,035	1,312,307	20.2
1929	1,451,526	81,084	140,289	1,392,321	21.1
1930	1,401,711	100,160	168,808	1,333,063	19.9
1931	1,374,899	147,549	141,821	1,380,627	20.4
1932	1,311,315	99,453	87,356	1,323,412	19.0
1933	1,444,104	104,330	105,200	1,480,930	21.2
1934	1,591,474	138,556	139,715	1,605,350	22.6

Japanese Paper Accurate records of production of pure Japanese papers are not obtainable due to the extensiveness of production and the widespread and different classes of producers. Much "washi", or home-style paper is now made by machines and aside from this group we are at a loss to determine the exact amount produced. The Nihon Seishi Rengokai estimated the production of Japanese papers during 1932 to be about 150,000,000 lbs., and with an average price of 40 sen per lb., the total value was ¥60,000,000 for the year. Exports of these Japanese papers in the same year were 5.5% of the total weight. Subtracting exports from total production, about 140,000,000 lbs. remain as the amount consumed in 1932.

Pulp Industry

Since Japan started to manufacture wood pulp in 1889, its development has kept pace with the development in the paper industry, and expansion during the time of the World War was prodigious. The industry has been in a state of depression since 1921, but in spite of that capacity of production has expanded. In the years 1930, 1931 and the early part of 1932, it was further depressed on account of the shrinkage in demand, lower prices, and competition from Canada and Scandinavia.

Production and Imports The peculiarity of paper pulp production in Japan is that there is no independent mill which produce pulp of this description, that which is produced being turned out by paper-makers, who not only produce for their own consumption, but also for the purpose of selling to other paper-makers. Most of Japanese paper-makers who do not own pulp mills, therefore, must either rely on the Japanese pulp

Digitized by Google

producers for supplies of pulp, or must buy imported pulp. Tables given below show the amount of production and import of pulp, as well as the amount of lumber used for pulp production. There is hardly any export of pulp from Japan.

PRODUCTION OF PULP

(in tons)

Year	Sulphite Pulp	Ground Pulp	Kraft Pulp	Others	Total
1928	310,020	237,203	20,306	—	567,529
1929	335,436	257,043	26,123	—	618,602
1930	337,151	259,984	28,402	—	625,537
1931	290,171	246,489	30,049	—	566,709
1932	277,588	241,746	31,786	—	551,120
1933	310,621	267,993	40,144	1,281	620,039

QUANTITY OF LUMBER CONSUMED FOR PULP MAKING

(unit in koku)

Year	Lumber Grown in Japan Proper	Lumber Grown in Hokkaido	Lumber Grown in Saghalien Isd	Lumber Grown in Korea	Total
1928	369	2,411,572	5,268,041	224,796	7,905,884
1929	616	2,399,972	5,881,730	295,751	8,578,069
1930	870	1,991,764	6,234,974	199,280	8,426,888
1931	280	1,891,183	5,823,950	201,548	7,416,011
1932	970	1,292,612	5,224,265	276,302	6,794,149
1933	2,917	1,367,684	5,594,475	313,807	7,278,883

IMPORT OF PULP

(Qty in 100 kin and value in ¥1,000)

Country of origin	1931 Qty	1931 Value	1932 Qty	1932 Value	1933 Qty	1933 Value	1934 Qty	1934 Value
Sweden	272,530	1,792	230,132	1,220	439,657	3,571	800,652	7,488
Norway	366,536	4,115	174,037	2,013	527,249	7,577	669,256	10,464
U.S.A.	374,371	3,951	339,845	2,418	755,276	7,801	1,415,096	16,464
Canada	455,567	3,144	829,218	5,200	788,420	6,043	679,951	7,245
Others and total	1,712,784	15,328	1,703,762	11,840	2,708,373	27,066	3,814,656	44,265

Demand and Supply There is scarcely any export of pulp from Japan, and domestic production plus the quantity imported can be taken as quantity required. The following table shows the relation between demand and supply.

DEMAND AND SUPPLY OF PULPS DURING THE LAST 5 YEARS

(Unit in ton)

Year	Quantity produced	Quantity imported	Quantity required
1928	567,529	73,144	640,673
1929	618,602	80,410	699,012
1930	625,537	79,107	704,644
1931	566,709	100,636	667,221
1932	551,120	101,168	652,288
1933	620,039	159,880	779,919

Digitized by Google

From 90 to 93% of the quantity consumed is taken by the member companies of the Rengokai.

Rayon Pulp Rayon pulp really holds no claim for inclusion here except that it is produced by the paper pulp manufacturing companies, who in turn are the paper manufacturers. A very brief survey only will be given. The rapid progress of rayon industry (see Chapter XVIII) is nothing but marvellous. Along this the consumption of rayon pulp increased rapidly. The total demand on rayon pulp in 1934 reached more than 70,000 tons, showing an increase of 70 per cent. over that of 1933. But the domestic production of rayon pulp amounted only to about 10 per cent. of the total requirement in 1933, and even in 1934 the quantity produced was barely 10,000 tons, which made it necessary to import more than 60,000 tons. Rayon pulp produced by the Oji Paper has now passed its experimental stage, and the company has extended mills so that it expects to produce about 24,000 tons a year starting from February, 1935. The company also established an independent company called Japan Rayon Pulp Co., Ltd., in Karafuto, with the capacity of 30,000 tons a year, which will be solely engaged in production of rayon pulp, and begins operation in April, 1935. The Oji Paper, therefore, is prepared to produce 54,000 tons of rayon pulp from the latter part of 1935,

1934 Paper Industry

Trend in General For the past two years paper industry was freed from the pressure of foreign competition through lower exchange and higher tariff. The increased demand made it possible to reduce the curtailment of production which was fixed at 55 per cent. since December, 1931 to 46 per cent. Furthermore, the sealed stock of paper has been reduced to a quantity smaller than regularly stocked quantity, which contributed in making the price strong.

The increase in volume of consumption made the demand and supply relation very sound. However, the nominal price of paper did not rise, while the price of pulp rose. Most of members of the Nihon Seishi Rengokai buy pulp so that their interest is directly opposite to that of the Oji Paper Co., Ltd. which produce 95 per cent. of the total domestic production of pulp. These companies, therefore, lodged claim with the Oji Paper Co., Ltd. and succeeded in reducing the price of pulp by 5 rin lb. in the latter part of the year.

Demand and Supply Production of foreign-style papers by member companies of the Nihon Seishi Rengokai in 1934 was 1,591,474,000 lbs. which, as compared with 1,444,104,000 lbs. of 1933, showed an increase of 147,370,000 lbs. or 10.2 per cent. Export amounted to 172,306,000 lbs. valued at ¥20,650,000 and showed gains of 18,282,000 lbs. and ¥2,963,000 or 11.8 and 16.7 per cent. respectively over the year before.

Import of paper amounted to 138,556,000 lbs. valued at ¥11,925,000 which showed an increase of 32.8 and 15.6 per cent. respectively over the year before. As to pulp, about 508,620,000 lbs. valued at ¥44,250,000 were imported from the U.S.A., Sweden, Canada, Norway and Germany, etc. The domestic requirement of pulp was 1,605,350,000 lbs., showing an increase of 148,270,000 lbs. over 1933.

Pulp Consumption of pulp by member companies of the Nihon Seishi Rengokai in 1934 follows:

Digitized by Google

CONSUMPTION OF PULP FOR PAPER

(by member companies only)

Description	in tons 1933	1934	Increase in 1934
Chemical pulp	397,731	401,601	3,870
Ground pulp	255,396	296,344	40,948
Total	653,127	697,945	44,818

Both chemical and ground pulp increased in consumption, the rate of the total increase being 6.8 per cent. over 1933.

As regards production of pulp, the Forestry Bureau of the Department of Agriculture and Forestry estimated 696,560 tons as against 620,039 tons of 1933. However, the boom in the paper industry was such that the domestic production of pulp alone was not enough to meet the demand, this resulted in large import, figures of which follow :

IMPORT OF PULP

	In 1934	Increase over 1933
Quantity of pulp imported in tons	225,300	65,420
Value of pulp imported in ¥1,000	44,255	17,189

Figures show that the increase over 1933 was about 65,420 tons, which includes, however, a large quantity of rayon pulp.

Curtailment of Production The boom which has been kept up since the latter part of 1932 has enabled paper-makers to reduce the percentage of curtailment of production of foreign-style papers by successive steps. The curtailment which was kept at 55 per cent. throughout 1933 was reduced to 51 per cent. in May, 1934 and again to 46 per cent. after October of the same year. Curtailment of production of Japan-style paper is maintained at 30 per cent.

Pulp Industry in Manchoukuo Four companies have been established in Manchoukuo for production of rayon and paper pulp. They are Oji Paper Mills Pulp Co., Ltd. with a capital of ¥20,000,000, Eastern Manchurian Pulp Co., Ltd., with ¥15,000,000, Japan Manchurian Pulp Industry Co., Ltd., with ¥10,000,000 and Manchurian Pulp Co., Ltd. with ¥5,000,000.

Market in General Good sales of foreign-style paper kept its price firm. However, mindful of warning of the Department of Commerce and Industry, the Rengokai did not raise the nominal price. It is thought that a further raising of price by a large margin would be impossible at present, even though the market improves further. The following table shows firm tone of the paper market indicating that the control of the industry is well maintained :

MARKET PRICE OF B IMMITATION PAPER

(in sen per lb.)

Months	Highest	Lowest
Jan.-June	16.8	16.8
July	16.8	16.7
Aug.-Dec.	16.8	16.8

As regards pulp it was once very difficult to make import owing to low exchange, which raised the price of domestic pulp. Along with the great demand on rayon pulp, price of unbleached sulphite pulp rose as high as 8.3 sen per lb. in the earlier part of the year, which later declined to 7.7 sen, again picking up to 8.2 sen toward the close of the year. The fluctuation of price follows :

MARKET PRICE OF PULP

(in sen per lb.)

Months	Highest	Lowest
Jan.-June	8.3	8.3
July	8.3	7.7
Aug.-Oct.	7.7	7.7
Nov.-Dec	8.2	7.7
